CHAPTER I.—THE MAN OF THE TUNDRA.

BEYOND the sixty-eighth parallel, where the great line of mountains that sprawls from Colorado to Alaska swings westward and is marked on the map as the Endicott Range, lies a dreary waste of tundra stretching to the Polar Sea. South of that line lies Alaska the wonderful, with the great glaciers that feed her rushing rivers, her creeks rich in gold. There lie her impenetrable forests, her verdant plains luxuriant with wild grasses, her scarped mountains that dwarf men to insignificance, her innumerable lakes embosomed in the hills or shimmering in the open, and stocked with multitudes of fish. In her forests and hills the moose and the bear find their favourite habitat; the white mountain sheep venture dizzily on the cliffs; the fur-bearing animals abound; and life, though at times grim and harsh enough, is a joyous thing for the strong.

But beyond the Endicott Range lies Alaska the desolate—the great Arctic desert. No tall timber lifts itself above the waste of moss, frozen solid in winter and thawed barely to the depth of an inch or two by the short summer suns. Low bushes of willow and spruce and the *Rosa nitida* rear themselves but a few inches from the sodden or frozen expanse, and whilst they are visible the venomous mosquitoes surge in clouds; and when invisible by reason of the deep snow, above them the blizzard rages in fury, driving southward from the pole. But whether in summer or in winter the land is raw and inhospitable. On its sea-fringe live the Eskimos, in its interior a few degenerate Indians; and once in hundreds of miles a white man, with the hardihood of the conquering race, makes a home in the bleakness for the purpose of adventurous trade. Occasionally a deserter from the whaling-stations ventures southward, to be lost in the dreary waste; a prospector following his gipsy life skirts the fringe in his pursuit of gold; but for the most part the land is given up to feathered or furred creatures that here have an inviolate sanctuary, man turning from the terrible emptiness, over which for him at all times death broods sullenly.

On the seaward edge of this desolation marched a white man. Tall and lean, he

stooped a little under the burden of his pack and rifle and prospecting tools. His face was hidden in a veil of dirty mosquito net, round which the malevolent insects swarmed in myriads; whilst continually he brushed the winged pests from his unprotected hands, which were streaked with blood. A continuous hum accompanied him as he marched, and from the sponginess came squelching sounds; for between the saturated moss of the tundra and the permanently frozen soil the water from melted snows and summer rains lay in hidden pools. Once, reaching a small elevation, he paused and looked round him. To his left, half-hidden in mist, lay the sea. Elsewhere stretched the mossy plain, with patches of wild-flowers indicating the drier places, and dwarf bushes breaking the level dreariness. Brushing his hands one against the other continually, he stood taking in the miserable prospect, miserable even under the sun; then he gave a harsh laugh.

'Heavens! What a desolate land!'

He moved forward again, following the undulation towards the sea, came upon one of the small rivers which blindly threaded the waste, and presently found himself on the shore, where the sea broke in gentle ripples. There was sand there and boulders, which for a brief time he submitted to cursory examination, as the instinct of the gold seeker asserted itself; then he moved on towards a long spit of land which thrust itself in the sea perhaps half a mile away.

'There'll be driftwood there!' he muttered, as he brushed the mosquitoes away once more; 'and I'll make a smudge and get rid of these humming devils.'

There was ground for his description. The thin pungent song of the myriad mosquitoes buzzing in close proximity to his ears was almost as annoying as their sting. For hours it had accompanied him in his march across the tundra. He could not grow accustomed to it; it distracted him, and the ripple of the sea on sand and boulders was like music in his ears, vexed by the venomous hum.

'I'll camp at the spit,' he muttered to himself, 'and after a sleep I'll beat it southward

to the hills. I reckon this is no place for a white man !'

The spit lifted itself higher to view as he approached it; a breath of wind momentarily swept the buzzing cloud from his head; and soon he came upon a place where the boulders were more numerous and sand gave place to shingles. He began to search for driftwood, but found none, and after a little time stood in thought. Then he nodded his head.

'The other side of the spit, of course !'

He climbed the long arm of land that thrust itself out to sea, stumbling among the lichen-covered boulders of which it mainly consisted, and as he reached the crest, glanced without any particular eagerness at what lay beyond. A small bay disclosed itself, with another spit of land, similar to the one on which he stood, on the farther side. It was, it seemed to him, more desolate than the coast behind him, and he was just about to descend to the beach when, behind a clump of boulders scarcely twenty yards from the spot where he stood, his eyes caught sight of something which moved.

The net about his face, almost black with mosquitoes, blurred his vision, and he swept aside a handful of the insects before concentrating his gaze upon the place. For a moment, waving his hand to keep the insects off, he stared steadily at the boulders. Nothing moved there; and there was nothing to be seen but the water-worn stones and the tundra behind. Thinking he must have been mistaken, he gave a short laugh, and began his descent to the shore. But scarcely had he taken the first step when again he saw something move behind the boulders; and, a second later, a human figure broke cover and began to run along the bay, leaping over obstructing boulders with the agility of a mountain sheep.

He stared in amazement. The running figure wore the dress of an Eskimo woman, but was taller than the average of that Arctic race; and as he watched he made a discovery that moved him with sudden excitement—the hood of the woman's *anorak* had fallen back, and the hair that streamed behind her as she ran was the colour of ripe corn. But the hair of Eskimos, as he knew, was black, and as the significance of that streaming gold thrust itself upon him, he guessed that here was a woman of his own race. On the instant, his voice throbbing with excitement, he shouted reassuringly, 'Hallo! Hallo, there !'

The fugitive took absolutely no notice. Without pause, without even so much as a glance over her shoulder, she hurried on; whilst the amazed prospector once more sent forth his hail, 'Aho-o-y! Wait !'

The woman gave no sign of having heard him; and, without wasting further time, he hurried down the spit and began to follow her

along the shore. Burdened with his pack and tools, he could make no great speed, and the fugitive easily outdistanced him; but he kept on, his eyes dancing with excitement, his mind thronged with questions.

What was a white woman doing up here? Who was she? Why should she run away from a man of her own kind? These and a score of other questions flashed through his brain as he pursued, but to no one of them could he find a satisfactory answer, though many suggestions followed on the heels of them. Perhaps there was a whaler's camp upon the coast, whose presence he had not suspected. Or maybe some prospector had made a strike and was working it secretly; or some trader had a store among the Eskimos, and had brought his wife for company in this desolate land! But why should the woman run away from him? And why did she wear Eskimo dress, which to a woman of white race in the Arctic summer must have been desperately uncomfortable?

With his mind thronged with questions and inconclusive answers he hurried forward, making a devious course among the boulders with which the shore was strewn, and in his excitement forgetting to brush the blood-thirsty mosquitoes from his hands. He had traversed less than half the width of the narrow bay when he saw the agile fugitive reach the spit of land at the farther end, mount it quickly, stand for a moment clear to view, then disappear beyond the crest. What lay on the farther side he could not guess, but the mystery of the fleeing white woman intrigued him, and he was determined to find out. No thought of danger entered his mind, and if it had it would not have deterred him; but when it was unexpectedly forced upon him his surprise was the greater.

When that happened he had reached the little cape beyond which the woman had disappeared; and, climbing it laboriously, had just glimpsed a wide bay beyond, when something whined over his head, and a second later the crang-g of a rifle sounded through the murmur of the seas and the hum of the mosquitoes.

Amazed beyond all expression, he dropped on his knees, and crawled hastily towards a moss-clothed boulder which offered convenient cover. Following astonishment, his first emotion was that of anger that any one should so wantonly have sought his life; but after a minute or so this gave place to amusement, and he laughed at himself as he crouched behind the green boulder, the weight of his pack pressing him down. 'Here's a nice mess!' he commented aloud, and glanced back on the way that he had come.

Safety, he knew, lay that way. It would be easy to retreat along the boulder-strewn shore

to the next bay, and then once more take the tundra and make his way southward away from the peril in front. But that unheroic way, though unquestionably it was the way of safety, did not appeal to him. In his nature was a strain of stubbornness that was not easily turned aside—or he would not have come so far across the desolate tundra; and, in addition, the mystery of the white woman who had fled from him intrigued him vastly. As he thought of her, his resolve crystallised suddenly. 'No!' he muttered, as he turned from the backward way, 'I'll know the meaning of this, or my name's not Roy Carwyke.'

From the sheltering boulder, as well as he could, he began to survey the prospect the raised land afforded. Straight ahead the view was blocked by the moss-covered stone; but to the right the vast stretch of tundra revealed itself, and he searched it eagerly for any sign of human presence. At first he found none; but after a minute or two, venturing to thrust his neck forward and stare round an angle of the boulder, he caught sight of a score or so of caribou-hide tepees pitched on the edge of the tundra some distance down the wide bay. 'Eskimos!' he ejaculated, and then hastily withdrew his head as a bullet flattened itself against the boulder. 'Phew!' he whistled. 'They mean business!'

Again the feeling of anger that he should be thus wantonly attacked surged uppermost, and, lying well in the shelter of the boulder, he began to unbuckle his pack. As with a motion of his shoulders it rolled clear, projecting a little beyond the rock, again the distant rifle spoke, and a bullet plugged the pack. 'A marksman!' he ejaculated; and added grimly, 'Well, we will see! He sha'n't have it all his own way.' Thrusting his rifle forward, he slid back the safety-catch, threw a cartridge into the chamber, and waited. The next time the distant aggressor fired he would try a shot himself.

Again his eyes searched the tundra, this time more narrowly than before. The three shots that had been fired had come from directly in front of him, and so long as he did not expose himself, and the marksman did not change his position, he was safe. If, however, the other were to creep across the tundra and outflank him, the boulder would cease to afford cover. But the great stretch of moss, broken here and there by dwarf bushes and starred with flowers, slumbered in the sunshine, its stillness unbroken except by the dancing insects. Reassured, his gaze turned the other way, towards the sea; and instantly his brown eyes grew round with surprise.

Well in the shelter of the spit, lying on a reef of rocks now partly exposed by the low tide, was a small schooner. Two of her masts were gone, and the third raked the sand as she lay careened, a great hole in her hull, in and out of which the water swirled, showing how she had met her end. For a moment the

surprise occasioned by the discovery held him; then his eyes examined the wreck keenly. Except for sea-birds perched upon it, there was no sign of life about the vessel; and whilst the broken masts gave the wreck an air of dismantlement, from the fact that it was not more battered he was sure that it had not lain long in its present position.

He wondered how it had come there, what had become of the crew, and whether the woman whom he had seen had arrived here in that broken hulk! In his interest he overstepped the bounds of caution, and, leaning forward a little, was warned by the whine of a bullet that he was in no position to take liberties. 'Confound the fellow!' he muttered, as he flattened himself anew behind the boulder.

The thought crossed his mind that possibly it was the woman who was firing, but that in no way lessened the indignation that was mounting within him. Why should she or any one else thus attack a stranger? Search as he would, he could find no answer to that question, and after a little time he began to wonder how long he would have to lie in his present position. The mosquitoes were hovering over him in clouds. To protect himself he was forced to lie upon his hands, and there were moments when he could scarcely see the rock in front of him by reason of the insects hanging on his veil like a swarm of bees. He considered the situation carefully. It was the season of the midnight sun, and there could be no waiting for the friendly cover of darkness. And back he would not go. He would at all costs find out what that white woman was doing up—

The thought was cut short by the whine of a bullet high above his head, followed almost simultaneously by the sound of the shot. 'A wide—or a warning,' he muttered. 'Which?'

Scarcely had he asked himself the question when the sounds were repeated, and a second later the crack of a rifle from the tundra to his rear made him start. 'Great Jupiter!' he whispered as he strove to look round. 'Taken in the rear!'

A moment after, however, he was reassured on that point, for two rifles cracked almost simultaneously, and he heard the bullets go whistling on their opposite ways well above his sheltering rock. He was no longer the target of the marksman in front. That worthy had transferred his attentions to some one well behind him, who was replying to the firing. But who could it be?

His mind could supply no certain answer to this question. He looked at the wreck, and wondered if some of her crew were still in the vicinity. That was likely, and that they had some feud with the Eskimos at the camp which he had seen was more than possible. But in that case, why had the white woman fled to the natives rather than to her own kind?

Listening to the exchange of shots, and realising that the man behind him was drawing nearer, he puzzled over this question for some time, whilst the rifle duel went forward. He cautiously altered his position, and with his back to the rock tried to get a glimpse of the man who, as he was now convinced, was advancing to his deliverance. For a little time he saw nothing, then a dozen yards from the point where the tundra ran down to the beach, and perhaps three hundred yards from the spit, he saw a head cautiously lifted above the dwarf spruce. In the same instant, as it seemed to him, the rifle at the distant encampment cracked, and the head that he had seen dropped suddenly. He waited anxiously. This time there was no returning shot; and though he watched the spruce like a lynx, he could see no sign of movement. The conviction assailed him that the man who had been advancing

to his help had paid for his temerity either with his life or by being badly wounded; and he was conscious of an anger beyond anything that the attack upon himself had occasioned.

Beyond him was a marksman ruthless in his purpose, and out there on the tundra was a dead or injured man who had suffered in the endeavour to help him. He felt he could not lie there without making an effort to ascertain what had happened, and he was just about to attempt the hazardous crawl that three hundred yards across the tundra represented, when to his amazement he saw the figure of a white man slip onto the beach, and a voice hailed him: 'Drop off the spit, stranger, and fall back along the beach. Mind you don't show a mark, or those devils will get you.'

(Continued on page 20.)

THE RIGHT OF THE ROAD.

By T. A. COWARD.

I.

THE corpse of a juvenile sparrow lay in the roadway, a drop of blood from its beak staining the dust a deeper red. When enjoying its recently acquired powers of flight it had met a motor; that is all. The open road is free to all—in that we glory; it is every man's land, not no man's land, and even a sparrow may frequent it without question. But accidents will happen, and the greater the speed of transport the greater the necessity for care. The fate of the inexperienced sparrow teaches a lesson and provides food for thought on the perils of the road. If a child is run over by a car, even by a cycle, it may be rewarded by a notice in the local press, which, to the juvenile mind, means glory. But the lower animals, even if they have rights on the highway, are denied even an obituary notice. They shall have one.

Many, either from motives of economy or from choice, still use what is popularly known as the 'push-bike,' and, for exercise or the enjoyment of the country ride, it has advantage over the luxurious ease and power to cover distances of the mechanically driven conveyance. Having, as cyclists, studied the roads for many years, we are struck by an interesting phenomenon: there is no very noticeable increase in fatalities to most animals through the increase in traffic and its acceleration. Dogs used to upset cyclists in the old days, and occasionally succeed now; they seldom upset the motor, though they try the motorist's temper. The psychology of the dog—especially the small dog—is a puzzle, and, as every dog-lover knows, shows infinite variation. Many small dogs are

conceited; they believe, apparently, that they are guardians of the road, or that the road is provided for their edification, a place where they may meet their friends and settle misunderstandings with their enemies. Anything which disputes this right by travelling fast must be chased with angry barks. If the vehicle is swifter than the dog all is well, unless something equally swift approaches in the other direction; but if the dog can overtake the cycle, car, or whatever has annoyed it, there is every chance of a tragedy. The dog which is well run into, or even run over, by a cycle learns a wholesome lesson; in future it frequents the side-walk. It may annoy pedestrians, it is true, but if they trample upon it, its sorrows are short-lived. Indeed, a dog when trodden upon will make the accident an excuse for obtaining what so many dogs value, sympathy and petting. An irresponsible puppy, the other day, managed to get its hind toes under a heavy boot, and complained bitterly; it was a front paw it offered to its mistress when, whimpering, it told its troubles, and when the uninjured foot had been comforted it continued its romps.

The dog will pass the time of day with every other dog it meets, and insists upon crossing the road to speak to a friend or a foe, however busy the traffic. This was bad enough when the muscle-driven cycle was the swiftest vehicle; the rider nervously rang his bell or produced uncouth sounds, but the dog did not always heed the warnings, and the rider dismounted speedily and without grace. But the puppy which learned by sad experience, either from the shock of contact or the stick of its master, soon managed to avoid accident when it heard

the bell. Petrol came in, and with the increase in swift travelling many dogs met with accidents and usually perished. Here is a problem for the student of heredity. Granted that the young dog learned sense after a few rough knocks and tumbles, it might be argued that its offspring could inherit the acquired characteristic and be born cautious; heredity would teach them that it was unwise to run into a cyclist. But what about the motor? The immature dog that got under the heavy car left no descendants; it died young. It could have no family to which it might transmit memories of bitter experience. Yet though the number of cars on the road has greatly increased, and they travel far faster than they did, canine tragedies are little more frequent than they were when the first cars shook and rattled over roads adapted only for horse vehicles. A wiser, more restrained generation of dogs appears to have been evolved.

In one way heredity may function, for there is the old law of the survival of the fittest; the rash and inefficient generations of dogs have passed away, the careful, cautious survivors populate the land. The weeding out may still continue, especially amongst the young, but it is less wholesale.

II.

Cats, strange to say, are seldom run over. The cat is adaptive and self-possessed; its self-absorption, in many instances, saves it. No decent motorist desires to mangle a cat, and when puss carefully picks her way across the wet road, hesitating to shake a paw if she inadvertently steps into a puddle, the motorist slows down and gives her warning. She is far more concerned with her immediate comfort than the possibility of danger. It is wonderful how cats cross the roads in busy city streets, and one day, at an important crossing, I saw a kitten hold up the traffic for several minutes; indeed, it was quite as effective as the fabric glove of the constable on point duty, though it is only fair to say that this kindly regulator of the traffic gave some help. The kitten had deliberately crossed one line of trams when it sighted a small dog, and, heedless of cars approaching in the other direction, crouched and revolved, its eyes glued on its hereditary enemy. The dog was far too much concerned with its own safety to bother about the cat; it crossed safely, and then the kitten bolted, passing beneath the wheels of a moving lorry without damage; and with many smiles the policeman on duty set the interrupted traffic in motion.

The cat's presence of mind is seldom disturbed, except by the dog. On different railways I have seen a station cat crouch between the metals when a train approached, and remain until the coaches had come to a standstill, when it calmly jumped to the platform by way of the

step. One, on reaching the platform, sat down to scratch an irritable ear, oblivious of the fact that some of the hurrying passengers had to step out of its way. I have seen dogs killed at level-crossings, but never a cat. Indeed, at one level-crossing a fox-terrier so objected to the gates which closed the right of way during the passing of a very slow goods train, that it jumped through, and actually, after several feints, managed safely to pass between the wagons. All kittens are not so unconcerned as the one that stopped the traffic. Three of us were cycling along a broad road when a kitten got in the way; there was ample room for all of us, but the cat took fright and bolted back under a wheel. We stopped to render first-aid, but the patient rose, swore emphatically, and raced home. It had fully eight lives left. Probably the cat is in greatest danger at night, for the glare of head-lamps confuses it; indeed, it is two brilliant emerald lamps, the reflection of his lights in those wonderful eyes, which first tell the motorist that there is an obstacle in the road. The cat, seeing nothing but the glare, is apt to crouch, uncertain where to escape, and before the driver has time to pull up, all is over.

Head-lights puzzle many animals; everything looks black beyond the dazzling beam. On both cycle and motor I have followed a hare along a country road; the fugitive swerved from side to side, and we slowed down, but it dared not leave the light for the uncertain darkness, and only when the light was switched off did it plunge through the hedge. Years ago, when I was cycling at night, I just avoided a hedgehog. It was not excited, and so escaped, but what would have happened had I not seen it? With its spines laid flat it would probably have suffered; but had it rolled in the defensive attitude, with prickles erected by strong subcutaneous muscles, would my tires have remained sound? The thicker motor tire would hardly be punctured; and, indeed, the flattened urchin is not uncommon on the road, where at night it has wandered in its hunt for coprophagous beetles.

III.

The study of the behaviour of the different animals which claim the right of the road is interesting, and the student may learn by bitter experience; the shock to the animal is frequently too severe to teach any lesson. The domestic fowl deliberately makes a point of crossing the road in front of cycle or car, but it does not cross deliberately. Panic seizes it on whichever side of the road it is feeding; safety, it imagines, is on the other side. Unfortunately the hen, seeking treasure in the dust, is unperturbed until the danger is real; then the suicidal mania seizes it, and with cackle and fluster it hurtles beneath the wheels. Strangely, few are caught, but that is not the fault of the

hens ; but when there is a casualty the sufferer always either won a prize at the local show or, as the farmer's wife tells, with her voice broken with emotion, it was her little daughter's cherished pet ! A regular tariff of compensation, adopted in some districts, has altered this ; the hen is now a mere hen, and nothing more. If the cyclist comes to grief (and legs have been broken in the endeavour to avoid a rooster), the farmer does not compensate the sufferer.

When motors first became general, large numbers of hens failed to calculate that fraction of time which divided safety from disaster ; but the hen to-day is an excellent speedometer ; on questions of speed-limit she would make a valuable expert witness in the police courts. I remember one hesitating pullet which miscalculated, turned back, and dashed under the car. We slowed and looked back. Behind us, following in our draught, a cloud of feathers and dust revolved, but before we stopped the bird had regained its feet, shaken off all loose particles, and scuttled unhurt towards the farm.

There was a day when horses shied at cycles, but now the steam-tractor, the charabanc, or the noisy milk-motor is passed without an earprick ; the young horse has to be introduced to the alarming but harmless vehicles it will meet upon the road. There are many finely bred horses which will pass a heavy removal-van, but are thrown into panic by a wind-blown scrap of paper. Cows are uncertain in their behaviour, though they seldom show fear ; indeed, as they amble meditatively along they passively monopolise the best parts of the highway. A heifer may lower its head and threaten, but it usually backs into the ditch or its companions ; the staid old milker has another habit—she turns broadside on, and so asserts her right to the whole roadway. Sheep are more nervous, but they lack initiative, and as a rule bunch, each waiting for a lead from its companions, and fear of the shepherd's dog is even greater than fear of the car ; they will blindly plunge against the wheel in their effort to escape their noisy guardian. Pigs, on the other hand, will, if mature, continue on their contemplative way, holding up the traffic whilst they investigate any possible muddy food-supply ; but young pigs, with squeals and grunts, trot ahead and refuse to give way.

Lesser folk—the wildings—perish in their thousands beneath the rubber-wheels of the modern juggernaut. Mice, shrews, voles, snakes, frogs and toads, beetles and other insects, snails and other invertebrates, pay the penalty of competing with man. We cannot stop to succour the maimed worm, whose uninjured inches writhe and twist in agony, but the watchful robin in the hedge drops down to give first and last aid. The rook and the daw, the rat and the sexton-beetle, even the bluebottle, follow in the tracks of the destroyer and cleanse the high-

way ; very swiftly the corpses are utilised and converted into fresh living matter. At night the moth, lured by the glare, blunders against the bonnet and is struck down, whilst by day and night the aimless beetle stuns itself with a ping against the windscreen. Once I picked up an uncommon dragon-fly which I saw dart against a passing car.

IV.

There is one wild animal, seldom more than partially domesticated, whose habits always were and still are annoying ; the human boy is irrepresible. In those almost forgotten days when we rode high bicycles, this inhuman boy delighted to throw his cap at the wheel, and he was well out of reach before the bruised rider rose from the mud. When safer steeds were invented, the game became risky for the practical joker, for the rider dismounted more gracefully, if with less speed, and the boy was frequently overtaken. Even to-day the cyclist is not quite safe, for a vigorous 'tip-cat' or hard ball may strike when not intentionally aimed, and the children coming out from school never pause to look what is in the road. Marbles, tops, and other games are the cause of anxiety to the motorists, and there is one game, very like that of the hen, which is still worse—the child sees how near it can allow the car to approach before it runs across the road. The British boast that they enjoy sport most when it has a spice of danger ; the child begins early. Sometimes when the motor-horn has failed to clear the road, one destructive little animal is carried to the hospital, where, gazing on salutary texts, he repents at leisure.

When we look back and remember the roads of thirty, forty, and fifty years ago, we recall the empty highway, the country lane where the iron-shod hoof made pleasant music and the iron tire gave notice of approach long before it was necessary to make way. When we recall the evolution of the cycle—from the wooden-spoked 'bone-shaker,' on which we rattled unsteadily from side to side, the tall, unequal-wheeled 'spider,' and the 'kangaroo,' as well as those variously schemed tricycles—and when we pass on to the rapid spread in popularity of the petrol car and cycle, we almost wonder that any one or anything can live upon the road. We question whose are the rights to-day, but our answer varies according to the bias of the questioner. When we are afoot we call down anything but benediction on the producers of noise, speed, and smell, and advocate trunk-roads for motors ; if we cycle we are just as sure that the cyclist should have more consideration, and not be blared at with noisy horns if he prefers the crown of the road to the rutted gutter. But if our question comes from the inside of a car, we are justly annoyed by the rambling dog and the careless small boy, or if we are forced to creep

lease horse vehicles assert their right to travel on the road. We, too, will object to the charabanc with rowdy holiday-seekers, or the heavy motor-transport wagon; they demand a dangerous amount of space at every bend and corner. For many who travel by 'sharry' do so because they want the pleasures of the road, the open air, and freedom from the ordinary city life, and cannot afford more luxurious methods of travel.

To sum up fairly. Every one has a right to the highway—pedestrian, cyclist, the driver of the horse vehicle, the motorist or the charabanc tipper, but no one has the right to incon-

venience and endanger other travellers. True consideration for one another would make the road pleasant and safe for all. Even the animals seem to some extent to have learnt the lesson, but the less intelligent invertebrates can never learn it. The more we crowd the roads and the swifter we travel, the greater will be the devastation in our wake. After all, we made the roads for our own convenience, not as a playground or track for caterpillars, worms, mice, and sparrows. If they will not be content with the untrodden ways beyond the hedge, they must take the consequences.

GREETIN' HOWE.

By HILTON BROWN.

PART I.

L

THE bleak three miles of road between Raigie and Aberkeld cuts off, as it were, from the rest of the friendly mainland the blunt peninsula of Sleat. A low, drab, hummocky country, alternating between slopes of rough grass and swampy hollows, it affords good pasturage for sheep, but little else to attract mankind. On the northward, or more dismal, half stand two small farms, and in the south there is a third farm, while along the seaboard cling the few pitiful hovels of the village of Knoggan. Almost halfway between Raigie and Aberkeld disreputable stone gates stand up on the left-hand side of the road and lead the eye down a perfectly straight drive or avenue, over a mile in length, to the old, ill-favoured house of Sleat. Sleat House stands at the round apex of the peninsula, within easy earshot of the east coast breakers, and just to the north of it—a quarter of a mile distant at most—is that ominous place known by sinister repute under the name of the Greetin' Howe.

The inquiring traveller who should visit the Greetin' Howe at full tide (the reason for the selection of this particular hour will emerge) would find nothing more dreadful than a small burn trickling down between two bare grass hills and terminating in a little loch, narrow but deep, bordered here and there with outcrops of gray rock, and showing unexpectedly a clear bottom of the same substance. The sea, which is distant only a few hundred feet, is completely screened by a high ridge of hummocks, grass-carpeted on their inner face, and on the outer breaking down into the waves in a tumble of rocks. In a land wind it is impossible even to hear the sound of the breakers, and the traveller might imagine himself in the heart of a continent. But, let him fall asleep for an hour or two by the margin of this singular lake, he

would wake with a start and suppose himself the victim of a strange hallucination. The loch would be disappearing before his eyes, gently slipping away with a slow swirling motion of its waters, exposing every minute more and more of its gray rock basin. And he would be no longer in doubt as to the origin of that odd name the Greetin' Howe, the Weeping Hollow, for the air would be filled with the most horrible sounds. Cries and wailings, inhuman, yet abominably human as well, would resound through that dismal place, and under it all would run a deep, persistent sobbing, as though some inconsolable being wept its heart out in the most dreadful misery. Should our traveller be an ignorant fellow, or one readily susceptible to unpleasant sensations, he might well snatch up his staff and run for his life from the accursed place, sparing neither time nor energy till he won again the comparative homeliness of the main road. For, indeed, on a gray day the Howe in its greetin' might daunt the boldest; the heartrending sound of its sorrows conjures up the most fearful thoughts, and is only with resolution ascribed to the things of this earth.

The explanation of these marvels is, of course, simple. The surface of the loch lies at the level of the sea at high-tide; its bottom considerably below. Its basin is connected with the sea by some sort of subterranean tunnel never explored, and with every ebb and flow of the tide the loch empties and fills, making, with the strong suction and the passage of the water through some odd formation, the sounds described. For about an hour and a half round dead low-water the loch is completely empty, and in its bottom a black cavity under a sill of harder stone shows where the water goes and where a very bold man might follow. No man has seen the outer end of that fearsome tunnel, but it is known to lie below the water-level in a cleft or channel among the seaward rocks, where even in rough

weather the green seas eddy and curtsy as if to solemn measures. A man falling into the Greetin' Howe loch during the ebbing process would necessarily be drawn like a cork through that dark passage, and would emerge drowned and dead in the seaward channel, where he would float in the eddies till his body was taken out. This is what has actually happened. A short-cut right of way from Knoggan to Raigie skirts Sleat House and crosses the Howe, and on dark nights men have strayed or stumbled and been seen no more till they floated indifferent in the outer sea. A very bold man, as has been said, could enter the tunnel at the loch end at low-water and, if the conformation of it be as is supposed, could penetrate some way down it; but no man of Raigie or Aberkeld, or still more of Knoggan, would essay such a task. Superstition in Scotland is dying out fast, but the horror of the Greetin' Howe is still potent within a fifty miles' radius of Sleat. Hear it once, wailing and sobbing like a chorus from the lowest inferno, and you will suffer no surprise that this should be so.

From the macabre gloom of this forsaken countryside Sleat House itself in no way detracts. It is a building of no great age, dating only from the early nineteenth century; and the question why any sane being should erect in so dreary a locality what is, in pretence at least, a mansion, is answered by the history of its founder. This was the celebrated Thrawn Sanquhar, originally a fisherman of Knoggan, but at the end of his dark days a successful and particularly devilish smuggler. Tradition credits this builder of Sleat with the darkest attributes, spiritual and material; originally only an ill-doing man, he has become to half the county a memory of ill-defined but none the less arresting horror. Sleat House itself proclaims him a man utterly lacking in taste, unless it were for seascapes of the bleakest description; the so-called mansion is a miracle of yellow ugliness, to which its modern condition of chronic ill-repair contributes little relief. Not a tree shelters its nakedness, not a flower grows in its precincts; the long approach from the main road passes through nothing but barren and sombre fields of grass, while the few skeleton trees along its route, planted, no doubt, with ambitious hopes of an avenue, have been warped and tortured by the bitter winds till they resemble mutilated and loathsome beggars squatting along the approach to some oriental temple of more than usual repulsion. Thrawn Sanquhar lived hard and died foully, and bequeathed to his posterity only his white elephant of a house, which the declining proceeds of the smuggling industry could no longer support. It remained in their hands from generation to generation simply because it was impossible to sell. Tradition couples with some of Thrawn Sanquhar's most fiendish exploits the locality

of the Greetin' Howe; but tradition here must err, for the sea end of the tunnel could never have been accessible to man. Tradition further insists that in the delirium of his last fever Sanquhar cried out incessantly, 'Mind the Greetin' Howe! Mind the Greetin' Howe!' And when, on an appropriate night of storm and turmoil, the devil his master came to claim him, it was into the Greetin' Howe that he was carried shrieking away. This is as may be; at all events when the devil's agent came for his great-grandson James Sanquhar and slew him, whether or not he came from the Greetin' Howe, it was certainly into the Greetin' Howe that he retired.

At the period of this narrative—that is to say, the early 'nineties of last century—James Sanquhar was closing at Sleat a life as ill-spent as the tradition of his family could desire. He was the eldest of three brothers, sons of a dissolute sire, and he was a childless widower. The soul-destroying dismalness of Sleat House had killed his wife early, and James Sanquhar made no second essay in marriage. He was, however, by no means done with women, as a series of scandalous tales, still toothsome to the old wives of Aberkeld, can testify. In the latter end of his days he fell under the influence of a Catholic priest, reformed himself in name at least, and demanded *en secondes nocces* one Elsie Forgan, a maiden of Knoggan. Tradition—this time probably with strict accuracy—averts that he took this step only after less proper overtures had been rejected.

Elsie Forgan appears to have been an average member of her class, not specially pretty, typically virtuous, and typically unintelligent. Left to herself she would presumably have acquiesced at once in the laird's proposal—the more so as there was apparently no other claimant to her affections, and as her mother urged the alliance upon her. But she was not left to herself. She was blessed, or cursed, with a brother, Black Hugh Forgan, a mason by trade, a man of vast stature and physical strength, and imbued with that half-insane obstinacy not uncommon among Scotmen in this part of the country. The Forgans were a family long settled in this remote corner; half the population of Knoggan bear their name, and an ancestor is said to have been the lieutenant and associate of Thrawn Sanquhar till he was slain by his master in a particularly cold-blooded manner. This somewhat apocryphal vendetta young Hugh Forgan assimilated at the knees of a half-witted aunt until, in the local parlance, the thing 'cam' atween him an' 's reason'—which last was never perhaps very securely seated. He blustered and threatened a good deal, and was indeed bound over for a time at Sanquhar's instance; and finally he swore that unless James Sanquhar desisted from his attentions to his sister he would extirpate not only himself but the whole

enting male issue of his house. These, in fact, were his one surviving brother and two nephews, one by each brother.

These were expressions more compatible with the Dark Ages than with the early 'eighteenth-century, and beyond threatening to charge Forgan again, James Sanquhar paid them no heed. He prosecuted his wooing with agility and despatch. As is often the case with worth-while men, he had a considerable ascendancy over women, and doubtless, between a mercenary older and a half-mad brother, the poor girl, aided by no great intelligence of her own, was fairly bemused. At all events, Sanquhar pressed through his courtship all the quicker for Black Hugh's vapourings, persuaded the girl in a very brief time, and married her under the rites of the Roman Catholic Church.

The proverb assures us of the happiness of things not long a-doing; but proverbs may be false. At all events it was a strange wedding-night at Sleat, if we are to believe the testimony of the priest who effected the ceremony and the head retainer of the house, one Rennie Kellock. The bridal couple had retired early to their room, and Kellock was engaged in looking the front-door, while the priest idly looked on. Suddenly, with an ear-splitting crash, one of the dining-room windows was burst bodily in, and the frightful figure of Forgan appeared in the aperture with a mason's mallet in his hand. His face was blazing with passion, and, according to Riggie Kellock, he was literally roaring with fury. He sprang upon the horrified pair—both elderly men—as if they did not exist, and still roaring dashed to the stairway. The priest, with much presence of mind, snatched up a heavy copper vase and hurled it at him, but missed, and the dreadful figure disappeared from their view along the upper landing. Screams were heard, and Kellock and the priest, commending their souls to Heaven, pursued up the stairs. On the landing they were joined by the groom and by one Robb, a young farmer from Pitsadden, who had been sitting in the kitchen—the latter with a shot-gun in his hand. As they advanced to the room the uproar ceased suddenly, and Forgan, 'leanin' at the mou' an' rid bluid frae heid tae heel o' him' [Kellock], burst out upon them. They fell back at this frightful apparition, and the murderer made good the stair again. Robb then fired at him, with no appreciable effect save to add to the confusion with the crash and smoke of his black-powder cartridge. The priest went on into the room, where he found Sanquhar on the floor with his head battered out of shape by the mason's mallet, and his wife insensible on the bed. Robb, Kellock, and the groom rushed after Forgan, who went out by the dining-room window by which he had entered.

It was a clear moonlight night, and they had no difficulty in seeing the fugitive, who ran in

the direction of Raigie. Let Kellock tell what happened.

'We werena fifty yairds ahent him, and we cud see him fine when he nippit ower the hill and doon intae the Greetin' Howe. Ower we gaed efter him, an' there he was, haudin' straucht for the lochie. "Shoot him, Davie," I says, an' Robb lets fly again wi's gun. I dinna ken if he hit him or no, but he made a kin' of a swerve like an' a loup, an' he let oot a yell, an' in he gaed souse intae the middle o' the loch. Eh, sirs, it was awfu' to see in yon uncanny place wi' the mune shinin' an' the Howe greetin' an' sabbins' jist its very warst. Dobbie's (the groom) teeth were fair birlin' in his heid. "Goad be wi's," says he, "he's doon the Howe!" An' sae he wis—clean doon the middle o' her, suckit doon like a pirn. Never up cam' he, an' never wud, ony mair than Wabster or Lott that went doon there afore him. Nae mortal man wins oot o' yonder that's ance gane doon.'

By all precedent, the body should have been found next morning floating peacefully in the eddy outside. But it was not found—either that morning or any other. It was never found. To the terrors of the Greetin' Howe was now added the thought that somewhere in its vitals, drowned and dead, lay that dreadful being whose hate and fury had carried him to such appalling deeds.

A telegram was sent to Robert Sanquhar, the elder and surviving brother, apprising him of the unwelcome news that Sleat was now his. 'An' gin I had been gi'en my way,' says Kellock, 'they wud hae added tae that telegram, "Bide awa'." Ithers forgot—but I didnae forget—what Hugh Forgan had said. He was tae end no' only puir Mr James, but the hale brood o' Sanquhar. Whit wey can a deid man kill ithers? Noo ye're speirin', but it's a thing that's ta'en place afore noo. "Bide awa'," I wud hae said. "Dinna come near." But I wasna heedit—wae's me, I wasna heedit.'

Thus Kellock after all the events; and perhaps also—though there is no corroboration—at the time itself.

II.

Robert Sanquhar, a bluff, lax man, very different from James, came down to Sleat with the avowed intention of remaining there just long enough to clear up his brother's papers. He made, however, a longer stay than that; for he was found dead in his bed and almost headless on the second morning of his visit. A heavy sleeper, he had paid the penalty, and his death had aroused not a soul, not even, in all probability, himself. Beyond a gasp of startled horror the neighbourhood had nothing to say for some hours. Then came fresh facts of an even more disconcerting quality.

Janet Rae, the daughter of the cattleman at Pitsadden, left the house very early in order to catch the six o'clock train from Raigie. She went by the short-cut which passes near the

house of Sleat, and must have been in the precincts at about five in the morning—not much later than the hour at which medical evidence fixed Sanquhar's death. On the back of seven she burst again into her father's house in the greatest disorder, crying out, 'I'm deid! I'm deein! I'm awa' wi' t' a'thegither.' Given a cup of tea—that panacea of her class—she cried out loudly, 'Oh Goad, mither, I seen him, I seen him!' and collapsed into a prolonged faint or trance. Precious hours had gone by before she had recovered sufficiently to make any statement; then her words would have thrilled the most cold-blooded. The person she had seen was Forgan; she had encountered him 'linkin' doon the dykeside' between Sleat and the Howe, and he had 'gi'en her a glower,' at the mere memory of which she relapsed again into violent hysterics. She could not be shaken. 'Whit wey wud I no' ken him? We was weel acquent. It was Forgan, Black Hughie Forgan. I kent him fine.'

Janet Rae's horrifying news was variously received. Dobbie, the groom, voiced the general sentiment when he exclaimed, 'Keep's a! Risen frae the deid! I'm for awa'!'—a project which he put into instant execution. Riggie Kellock, hardly less terrified and equally convinced that all stood in the presence of a supernatural manifestation, showed a finer fidelity in sticking to his post. But there arose another school who reasoned that, as risings from the dead are impossible, Forgan was not dead; and as he must have perished if he went down the Howe, consequently he did not go down the Howe; therefore all the story of the pursuit was an invention of Kellock and Dobbie, who had really, on the night of Mr James's murder, hidden under their respective beds. Had the account of the pursuit been circulated solely by Kellock and Dobbie, this latter version might have gained ground; but it was impossible to impugn Robb of Pitsadden, a man whose courage was locally unquestioned. Said the objectors, 'Forgan could not have gone down the Howe.' Said Kellock, 'Doon he did go, for I seen him wi' thae twa e'en.' 'Then,' they pursued, 'he cannot have been drowned.' 'Gang ye doon the Howe efter him,' rejoined Kellock, 'an' see if ye come up again yersel's. If he's no doon the Howe at this moment, whaur is he?'

Where indeed; for all search was fruitless. Forgan had vanished as effectually as if he were indeed dead and drowned and his body caught up in some cleft of the tunnel while his spirit pursued its evil courses. No human eye had seen him save Janet Rae's; and even that might have been doubted, in spite of the corroborative effect of this second murder, had not a fresh footprint in one of the Sleat flowerbeds been found to correspond exactly with one of Forgan's boots.

'Anither telegram to be sent,' said Kellock,

and despatched it with all promptitude to Mr Eric Sanquhar, son of Robert and elder nephew of James. A reply came that Mr Eric would attend on the day of the funeral.

There being little good to be said of Eric Sanquhar, let us say as little as possible in his dispraise. He was a throw-back to a previous generation of Sanquhars—a hard-living, graceless young man, not too sober in his habits or too choice in his company. He conducted an agent's business of a dubious character in the city of Glasgow, and was known to despise all forms of country life as suited only for the more incurable of dullards. It was common rumour in the county that he had long since sworn some curious and binding oath never to set foot in the house of Sleat.

He kept his word. He came to Raigie by the afternoon train in a condition of only partial sobriety, and he delayed into the dusk of an autumn evening with a series of potations in the Grinnell Arms—which made him no better. From the Grinnell Arms he hired a dogcart—Dobbie's defection had made it impossible to send a vehicle from Sleat—which he insisted on driving himself and unaccompanied. His violence was such that his demand was granted. The history of that drive will never be known to mortal man; but a bolting horse brought the dogcart to the front-door of Sleat, and the dogcart was empty.

Spittal, the gardener, the one surviving retainer save Kellock, called his senior with a gray face and quivering lips. 'He's gotten'm already!' said he.

'Awa' wi' ye!' said Kellock stoutly. 'He's been the waur o' a dram and tummelt oot the machine. I never seen him sober yet.' But the hand in which he held his lantern shook, and it was in no natural voice that he bade Spittal come up the drive and search.

'No' me!' said Spittal promptly. 'No' for a year's wages.'

'Be damt tae ye then, ye muckle bairn,' said Kellock. 'I'll gang mysel'.'

And stoutly by himself he went—for not even a coward's fear of cowardice could budge the miserable Spittal. By himself Kellock went up that long dismal drive, the lantern swinging in his hands, the stockish and tortured trees springing on him like foul shapes at every step. By himself he came to the unmistakable traces of a swerve and a bolt—and to a dark figure that sprawled by the roadside. The keen wind from the sea played with its light overcoat with a mockery of life; and on the left side of the head was a dreadful smashing wound.

'Tummelt oot on a stane, did he?' said Kellock; but the teeth rattled in his head, for he saw as in a vision a frightful roaring man, framed in a wrecked window, with a mason's mallet in his hand.

In the morning Kellock drove to Raigie and

despatched yet another telegram—this time to Mr Andrew Sanquhar at the Parliament House of Edinburgh. Out in the street he drew his hand across a brow studded with cold sweat. 'That's the last time onyway,' said he to himself. 'There's but ae Sanquhar atween Forgan and his aith, where a week syne there stood fower. We're as weel wantin' yon last ane; o' him that's tae come I ken naethin' ava'. God help him here, for this is nae man's wark. My duty's done onyway; gin the fiends o' the pit tak' this ane as weel's the ithers, let the hail hoose o' Sleat come doon, roof an' wa', it'll nae fa' on Riggie Kellock.'

With something almost like a grim smile the old man climbed into the dogcart and set his face once more towards the haunted country. He knew Forgan was dead, knew he was risen from the grave and accomplishing horrors, knew that, these things being so, Mr Andrew Sanquhar was doomed; yet, stout heart, he did not flinch, but drove steadily off into the groping sea-fogs of Sleat.

From now onwards the story will follow the version of Mr Andrew Sanquhar—a livelier style than this staid narration. Andrew Sanquhar was at this time a struggling lawyer in Edinburgh, a man frail in body but ready and resolute enough of mind. That he was

astounded to find himself master of Sleat we may readily suppose, for he had been removed from that position by three sound lives—even supposing James Sanquhar to have no offspring by the unhappy Elsie Forgan. That he was not entirely overjoyed at the prospect we may well surmise, that he was sorely tempted to hang back we may suspect—and small blame to him, for the current journals had brought Sleat into a wholly undesirable prominence. At best Sleat was a nuisance, an interruption of his duties; at worst it might be the end of everything. It says something for him, then, that after but a brief cogitation he advised Kellock to expect him at once.

To save interpolations in the text, let it be explained here that the 'Roddy' of whom he makes so much mention was his close friend Roderick Moore, a half-fledged Edinburgh doctor, who made a better show on a football field than in a consulting-room. The young man's confidence perhaps exceeded his powers, but he was a tower of physical strength, devoted whole-heartedly to his friend, and was thus an Æneas capable of bearing this Anchises out of the perils of any ordinary Troy.

We proceed now to the remarkable narrative of Andrew Sanquhar.

(Continued on page 30.)

THE KAVIRONDO.

By 'SAFARI'.

I.

INHABITING the eastern shores of the great African lake, Victoria Nyanza, is a prolific tribe about whose mode of life or importance in the economic development of the rising British colony of Kenya little is really known by any except those in immediate contact with them.

This tribe is the Kavirondo, and is composed of two main sections, the Bantu Kavirondo and the Nilotic. Little is known of the earlier history of these two races, but, so far as one can gather from the reports of their older members, whose memories are at best very unreliable, the Bantu were in prior occupation of the territory, and were driven out of the south-western locations by the invasion of a tribe from the upper reaches of the Nile and the northern shores of the lake. The invaders did not come simultaneously, but rather in a succession of small sub-tribes or family groups, such as the Zo-Gem, the Zo-Alego, and so on.

Although actual warfare between Nilotic and Bantu has long since ceased, and intermarriage and free intercourse are carried on between the two races, there still remains a good deal of mutual jealousy, and often this can even be advantageous to administration, notably when it

expresses itself in rivalry between a Bantu chief and his Nilotic neighbour to have well-ordered and prosperous locations.

But sometimes the friction reaches to an extent where the administration is compelled to intervene. It is noteworthy that the Nilotics are in nearly every case the aggressors, although they are greatly outnumbered. They are by far the more vigorous and intelligent of the two races, and for many years have been penetrating quietly but effectively into the Bantu locations, so that recently when a change was made in the administration of the territory, and it was decided to place all the Nilotic locations under the direction of the District Commissioner at Kisumu and the Bantu under the District Commissioner of North Kavirondo, the Nilotics suddenly claimed as theirs a good deal of territory which they had never conquered, but in which many Nilotic families had settled and formed villages. However, a compromise was effected which appeared to please neither faction.

The Nilotics have had one great advantage in the struggle. The first Church Missionary Society station was opened in their country, and when, at a later date, the missionaries started in the Bantu country they brought with them Nilotic native teachers. These went forth

among the Bantu youth, teaching not only Christianity, but what we can term Niloticism as well; in short, they impressed upon their hearers that to be considered a Jalu or Nilotic Kavirondo was infinitely better than to be a Bantu—that the former were the race of the future, and had all the virility and capability of progress.

Their persuasiveness appears to have been so effective that I myself have heard in a native council a youth stand up and proclaim himself a Nilotic, while his old father has stood beside him and denied it flatly.

The Nilotics possess a far more subtle intellect, a more highly-strung nervous system, and a much greater receptiveness for instruction. It would seem that they are destined to fill the clerical and office jobs in the colony, while their neighbours will be the manual workers.

II.

In physical appearance the two tribes are not in great contrast, and often one can distinguish between them only by tribal markings; but as a rule the Nilotics are taller and of a more intelligent cast of face, while the Bantu are shorter and of heavier build.

In spite of occasional internal friction, however, the two races work in perfect harmony away from the reserve, and the tribe as a whole contributes probably about a third of the native labour employed in Kenya on European and Indian plantations, at the Mombasa and Kisumu docks, and on the Uganda railway. In addition it appears to provide the finest material as recruits to the colony's police and military forces.

The Kavirondo are, on the whole, the most physically fit, and without doubt the most tractable and willing workers of all the tribes in the colony.

The Bantu especially are not over-imaginative, and this is perhaps an advantageous trait, notably from the point of view of their employers, for if a sufficiency of food, shelter, and warm blankets is given along with a wage adequate to pay their hut and poll tax, they are content with practically any type of work. This is true in the main as regards the raw labour from the reserve induced to work in the settled parts of the colony. Such labour is, as a rule, indentured on a six or eight months' contract, the employer being bound to repatriate the labourers at his own expense on the expiration of the agreement. Nevertheless a large amount of casual labour makes its way into the market, and this is generally in fair demand, as, no contract being entered into, there is no liability to repatriate, and no fixed period to the employment. Thus it can be profitable to the employer to teach the native work of greater skill, since he will not be obliged to send him back to his reserve and terminate the engagement just when his master is beginning to reap some reward from the labours of his instruction.

The bulk, then, of this casual labour is of a higher order, and generally consists of natives who have attended one or other of the many mission schools in the reserve, or have been in longer and more intimate contact with the European. A large number of these workers prefer domestic service, and naturally they get a higher remuneration than the raw product of the reserve.

The domestic servant or 'house-boy,' as he is termed, is an interesting study. In this class the observer can see manifested the many influences, good and evil, of contact with the European and the Indian immigrant, and in many cases, regrettably, the unhappy consequences of freedom from ancient tribal discipline and restraint.

The Kavirondo who has graduated into this class distinguishes himself by his inordinate fondness for showy clothes of European fashion. He will invest all he has left from his meagre wages, after buying his food and paying his tax, in gaudy apparel, which he purchases from the Indian store-keeper. He revels in exploring the *dukka's* stock of caps, hats, shirts, cotton vests, and drill trousers; and doubtless what he spends on these contributes in no small measure towards keeping in motion the wheels of the cotton-mills of India.

It is indeed a strange thing, this love of raiment, which far exceeds the normal requirements of decency and cleanliness. It is a desire for constant change, and it is amazing to watch the exchange and barter that is carried on amongst the natives themselves.

I recollect one personal 'boy' of mine who never seemed to appear in the same pair of trousers or cap for two days in succession, and who informed me upon inquiry that he did not necessarily buy new things every time, but only exchanged with some one or other of his comrades equally desirous of variety of clothes.

The psychological interest of this characteristic is intensified, since, back in the reserve, the huge residue of the tribe roam about, each adult clad in a single goatskin, suspended by a cord from one shoulder and only partly surrounding him, while the children, and in some of the Nilotic locations the male adults also, go about in a state of entire nudity. And here I should like to state in passing that morality is highest in such locations.

Nothing can exceed the scorn cast by the clothed Kavirondo, 'civilised' in Nairobi or Kisumu, upon his naked brother in the reserve. His favourite epithet for him is '*shenzi*,' which has an infinite variety of meanings, among which we can include raw, uncouth, uncultured. On the other hand, he who has spent his life in the reserve has an admiration, perhaps mingled with fear, for one who to his mind has travelled far and seen much, who has journeyed in a railway

train (the *gari* run by smoke), seen steamboats and many other wonders.

III.

It is appropriate here to glance at the domestic life of the tribe. The natives live in small villages supervised by an elder or head-man, who in turn is responsible to the chief or sub-chief of the location. The village is often merely the family group. The surrounding piece of land is cultivated, and cattle, goats, and sheep are fed upon it. The cultivation is primitive, and as yet there is only an isolated chief or head-man who has a plough. Each house has its own little strip of land nearest its door, where enough grain or root-crops, such as yams, are raised to meet its needs for the season and generally give enough excess to brew some *pombe* or native liquor, which is always regarded as food. 'Kaffir corn' and 'mealies' are chiefly grown, and no attempt is made towards co-operation of effort or extending the area under cultivation, or even laying in a store of food during good seasons to provide for the famine which inevitably follows. It would appear, however, that one great obstacle in the way of storing grain is the entire absence of suitable granaries. The grain is merely put into miniature huts, raised a few feet high on poles, and is subject to the ravages of the weather and the hordes of rats which afflict the territory. It is doubtless the duty of the local government to provide buildings weather-proof, fire-proof, and, as far as possible, rat-proof, in order to mitigate to some measure the calamities of famine which periodically afflict these parts and wipe out so many of the inhabitants. Huge sums have in any case to be spent on relief measures when the trouble comes. Were it not better to use some or even all of this money in prevention?

Nevertheless one of the worst obstacles in the way is the innate improvidence of the native himself, and this can be eradicated only by long and patient effort on the part of administrative officers, missionaries, and other workers on his behalf. Cases are far from rare where natives sell their surplus to Indian traders at ridiculously low rates when food is plentiful, only to buy it back at ten or even twenty times more when the lean time comes upon them, which has been expected and stored for by the wily Indians.

The process of grinding is very primitive, and consists of pounding the grain between two stones, a large flat one on the ground and a smaller one in the hands. The stone chosen is not exceptionally hard, and I have often speculated on how much of it yearly finds its way into the digestive organs of the average Kavirondo.

The tasks of cultivation, grinding, and beer-making fall upon the women of the tribe. The children herd the stock, and the men spend

their time smoking, drinking, and loafing; at least so it would appear at first to the newcomer. But it has to be remembered that a large percentage of the adult males leave the reserve to labour on the plantations and other works, and only return on periodic visits to see how their household is progressing, and to hand over the money they have earned in order to meet their taxation liabilities. Economic pressure is driving an ever-increasing number of these to find employment outside the reserve while the women-folk keep things going at home.

IV.

The Kavirondo who does not profess the Christian faith is polygamous, and this includes the Mohammedans amongst them—and these, I may add, are increasing greatly in number. Many of the native non-commissioned officers in the King's African Rifles and Police Force are Sudanese and profess the faith of Islam, and so numerous Kavirondo who served in the local campaign adopted this faith, and have returned to their reserves and proselytised others. Their form of Mohammedanism is very elastic, and in many cases amounts to a mere name only and a few of the outward offices; but it is popular as being a 'black-man's' religion, and it does not require the high moral standards and the renunciation of many native customs required by Christianity. Hence it is growing in popularity among a race whose paganism even is of the very lowest order, and at best can be defined as little better than a sort of ancestor-worship.

The only limit, then, to the number of a man's wives is his own personal resources, for a considerable 'dowry' must be paid for each to her father or guardian, and under these circumstances you will conceive a father or a guardian is always forthcoming.

The 'dowry' varies in extent in different parts, but a fairly average one consists of four to six cows or heifers, about a dozen goats, and a sheep or two; the last-mentioned are regarded as small change. This payment of stock is not so much a price for the girl as an earnest of the bridegroom's good faith, for if he ill-treats her and she runs away from him, and if, when the case comes before the elders of the tribe, he is found to blame, he will in all likelihood lose both wife and 'dowry'; if, on the other hand, she deserts him without sufficient reason, he can reclaim the whole of his payment, and it can be realised her parent will use every method, just or unjust, to get her back to her husband, rather than part with the stock now he has it. 'Dowry' cattle are ordained never to be slaughtered, and even after their death the hides are kept with the distinctive markings upon them. Often marriage cases are brought before the District Commissioner extending back for

years and years, and these are frequently beyond settlement, for not only the claimants but the cattle themselves and the goats have reproduced, and the custody of children, together with the custody of a generation of cattle, has often to be determined. Moreover, the harassed District Commissioner finds drifting to his office the cases of which the natives themselves could find no satisfactory settlement. What chance for him, a European, in the hands of interpreters, for few of the reserve natives can speak Ki-swahili, the *lingua franca* of the colony?

As remarked above, the women do the great bulk of the labour on the land. From morning till night they toil, often with an infant hung on their back, and often they bring forth children in the very midst of their labours. The man is truly the lord and master, and even when they are walking on a road or a path the woman follows behind him. They never walk abreast.

But who can call the native woman unhappy? Is not happiness only comparative after all? We do not realise misery unless we have been at some time in the past in a more blissful state. And so it appears to me that many enthusiastic and gracious people are misdirected in their efforts when they endeavour to work a revolution in the status of the native woman in Africa, and apply Western ideals and conditions too suddenly.

No immediate cure can be accomplished. The process will be slow and laborious, and the missionary must be prepared to sow where others will reap. No one lifetime can expect to see the fruition of its efforts.

Moreover, as I have said, the lot of the women is not so wretched as it would at first appear to be. To put it bluntly, her husband regards her as his most valuable property. Children are valuable, especially girls, for reasons explained above, and just as a man will not maltreat his cattle, which give him his increase in stock and add to his prosperity, so he will not maltreat the woman who is the mother of his children.

In conclusion, let me say that one of the greatest tasks before the authorities is the solid, skilful, and discriminating education of this great tribe. Secular education is non-existent. The Government at present, for reasons of economy probably, prefer to grant mission-stations money to erect and maintain schools. The teaching received at the mission-schools is naturally of a strong religious bias, and there is sometimes considerable friction and overlapping of missionary effort. Each sect is eager to teach dogma, and is apt to submerge the converts in that sea of controversy which, after nearly two thousand years, shows no signs of disappearing. We Westerners have the advantage of knowing how the various schisms came about, and can appreciate their various subtleties; but how can these benighted savages, emerging from centuries of the lowest

paganism, understand? It were far wiser to combine effort and sink differences in the stupendous task of inculcating thoroughly first of all the fundamental morality of the Decalogue. Every endeavour should be made to bring this about, and to avoid the danger of 'veneering' the native, in order to increase the yearly return of 'converts' sent to the various mission headquarters.

I have dealt here with only one great tribe of the legion in our African territories. There are many others with as great a potentiality. They are eager for culture and instruction, and they are all imbued with deep veneration for the white man. The land has fallen to us without bloody conquest, and the great bulk of the natives are peace-loving and industrious. If treated with justice and honesty they will develop into useful citizens of our great empire. So far no pernicious doctrines have permeated the country, and under a wise and prudent administration it is impossible to predict to how high a state of development they can rise.

THE CHOICE.

LAD! there's the road that leads to the town, an'
the one that goes to the sea,
So choose your track (an' you can't turn back)—
which one is it to be?
The one's an easy-goin' road, but it has its petty
strife,
An' its foolish ends, an' fickle friends—is that to
be your life?

Or will you take the longer path to the outposts
o' the earth,
To the lands o' the sun, as I have done, an' find
out what they're worth?
You'll meet things squarely, face to face, an' death
will be no pale ghost,
An' life, you'll feel, is passin' real—the thing that
matters most.

It won't be a garden o' roses there, nor a game
you're playin' at;
Work, an' a bed, an' a roof overhead—'tis nothin'
much but that.
An' the work is hard, an' the bed is poor, an' the
roof is often the sky,
While the lotus-land is never to hand—'tis a dream
o' the by-an'-by.

For out in the bush it's an uphill fight, an' a
lonesome one as well,
An' a white man's face in a black man's place is
somethin' on which to dwell;
An' hardships, an' fever, an' deadly scourge will
follow you many a mile—
Oh! sometimes you'll think that you're bound to
sink, an' you'll wonder if it's worth while.

But all o' it's life you're livin' out there—not seen
in a lookin'-glass;
You can stand alone, with your soul as your own,
an' that's the test to pass. . . .
Lad! there's the road that leads to the town, an'
the one that goes to the sea,
So choose your track (an' you can't turn back)—
which one is it to be?

MALCOLM HEMPHREY.

BANK OF ENGLAND NOTES AND THEIR IMITATORS.

By W. COURTHOPE FORMAN.

FOR almost two hundred years the paper on which the 'Old Lady of Threadneedle Street' prints her welcome promises to pay has been manufactured in a little Hampshire village. The historic mills where this exceptionally fine paper is made are at Laverstoke, near Whitchurch, on the banks of the Test, that typical Hampshire river that, rising in the chalk-downs in the north-west of the county, runs through pleasant valleys and water-meadows, flower-decked and emerald-green, till at length, after many divisions and subdivisions, many joinings and rejoinings, it empties itself, cold from its journey through the chalk and crystal clear, into Southampton Water. Here, in this little village, by its pleasant stream, Laverstoke Mill has stood through the long centuries, for it finds mention in the Domesday survey. In the year 1718, being then a corn-mill, a ninety-nine years' lease of it was granted to Henry Portal at a yearly rental of £5 and 'one ream of foolscap paper neatly cut.'

The story of Henry Portal, the paper-maker, is a romantic one. A scion of an ancient French family, who for many generations had resided at Bagnols-sur-Cèze in the south of France, his father moved to Poitiers in about 1680, and ten years later Henri, the third son, was born. Following the Revocation of the Edict of Nantes (1685), those French folk of the Reformed faith, among whom were the Portal family, suffered for many years the direst persecution at the hands of their Roman Catholic fellow-countrymen. Arrived at man's estate, Henri Portal decided to leave his native land for the more friendly and hospitable shores of England. It was, however, no easy matter in those strenuous days for a Huguenot to shake the dust of France from off his feet, and it is told by one historian that Henri achieved his object only by concealing himself in an empty wine-barrel.

However his perilous escape may have been accomplished, accomplished it was, and he landed safely near Southampton in 1710. At South Stoneham, near that important and ancient port, were then the mills of the 'White Paper Makers' Company of England, mills chiefly under the control of Huguenots, to whom a charter had been granted by James II. a year after the Revocation of the Edict of Nantes. To the directors of these mills it seems probable that young Henri carried introductions. In 1711, at the ancient city of Winchester, he became a naturalised Englishman, henceforward to be known by the name of Henry Portal. In 1712 he acquired the lease of a paper-mill at Bere,

near Whitchurch, and such was his energy during the next few years, and so great was his success, that for the extension of his business he took the Laverstoke Mill, as I have stated, and practically rebuilt it in 1719.

It was in 1724 that, through the influence of Sir Gilbert Heathcote, the Governor of the bank, and a relation of the Hampshire Heathcotes of Hursley Park, Henry Portal was entrusted with the manufacture of the bank's note-paper, a privilege that has been continued in the Portal family, from father to son, till the present time. For more than sixty years of its existence the bank's issue of notes was principally those of £20, the amount being filled in by a cashier in ink, and during nearly the whole of that period no forger appears to have possessed the skill, the imagination, and the hardihood to imitate and put into circulation those highly-prized 'scraps of paper.' As specimens of the art of the engraver they were somewhat poor, and the skilled forger of to-day would have found their imitation but the merest child's play.

A 'linen-draper bold' was the first person to imagine himself in the part of a successful forger of bank-notes, but his run of luck was not a long one, and the stretch of imagination that started him on his mad career ended after a measure of success in a more painful stretch, when at Tyburn he and the hangman played the principal parts in a short but stirring drama.

A later and a far more successful swindler than the unfortunate linen-draper was one Charles Price, with regard to whose varied and adventurous career a whole volume might be written. At the early age of seventeen Price seems to have decided that 'the world should be his oyster,' to be opened with no sharp sword of steel, but rather with the weapon of an absolutely unscrupulous cunning. He played many parts—a gentleman's servant, an actor, a fraudulent brewer, a fraudulent bankrupt, a lottery-office keeper, a stockbroker, and a gambler being among the number. Then his fertile imagination conceived a bold, skilful, and resolute fraud upon the bank. He became an expert engraver, he manufactured his own paper and his own ink, and with his own press he worked his own bank-notes. A past-master of disguises, his one and only confidant (his mistress) devoted to him, he pursued this successful career of fraud for about five years. His imitations of the bank-notes of that period, 1780-1785, were superb, and when at last, after infinite pains, his disguise was penetrated and

his retreat discovered, he saved the hangman trouble by hanging himself.

At the end of the eighteenth and the beginning of the nineteenth century, forgeries of bank-notes became alarmingly numerous, and the number of executions for this capital offence not only outraged public feeling, but seemed absolutely powerless to stop the crime. Although in the year 1818 no fewer than four-and-twenty bank-note forgers were executed, yet in 1820 more than a hundred persons were convicted of this offence, while nearly three hundred were found guilty of having forged notes in their possession. The lowest denominations, the £1 and £2 notes, were forged in thousands by bogus-note manufacturers, who, generally escaping punishment themselves, sold their products at a vast profit to such poor and reckless folk as were ready to run their heads into a noose for the sake of 'filthy lucre.'

An agitation for the abolition of capital punishment for forgery now arose. The Rothschilds and most bankers, metropolitan and provincial, supported it. It was endorsed by that great lawyer, Sir Samuel Romilly, and had an enthusiastic adherent in George Cruikshank, whose imitation bank-note, with its ghastly row of hanging corpses, drove into people's minds the horror of such punishment. His talent was undoubtedly of no small help to the movement, which was at length successful.

Then came a great improvement in the engraving and printing of bank-notes; and last, but by no means least, in the paper upon which the notes were printed. In this direction the bank received the most valuable assistance from Mr John Portal, who was then the representative of the Portal family at Laverstoke. This gentleman appears to have taken endless pains in making experiments to obtain a paper which should defy imitation. It may here be interesting to recall that, in the early years of the Portal contract, the paper travelled from Hampshire to London by water, but later went by road in the maker's own wagons. Neither of these courses was adopted in sending to Mr John Portal, then in London, and in conference with the governors of the bank, a specimen of a certain new paper, with regard to which the greatest secrecy was to be observed. Sir William Portal has told us in a most interesting article, to which I am much indebted, how this most precious specimen was to be conveyed to London. 'Let it be sent to me,' wrote Mr John Portal to his partner at Laverstoke, 'on Saturday morning by the little Salisbury coach, first put into a thin small box and nailed down, and then enclosed in a parcel of vegetables that will come from my house Saturday morn; directed to 39 George Street, Portman Square. Carriage paid, and pay the carriage.'

How entirely successful the bank papermakers were in their efforts may be judged by the

diminution in the number of attempts made to bamboozle the public with 'flash fimsies.' Such attempts have, however, been made from time to time, but the larger number of them were so clumsy that it is wonderful that they should have deceived any one; and yet, perhaps, hardly so wonderful when we recall the many occasions where the hawks have fooled the pigeons with such parodies of the real article as notes on the 'Bank of Elegance.' I can remember a note done entirely in pen and ink, which, early in the 'seventies of last century, was passed at a popular West-end restaurant, to have the word 'forged' stamped upon its unblushing face upon reaching the bank. A few years later a big batch of what were then regarded as excellent forgeries was launched on the Continent, and by these not a few continental money-changers were badly bitten. A packet of them, chiefly 'hundreds,' that had landed in this country, was found by some labourers on Clapham Common. In the 'nineties yet another dangerous flock of forged notes winged their way about the country. They purported to be issued by one of the bank's country branches, and were of sufficient excellence to pass somewhat freely on race-courses and other places where people congregate in large numbers. As far as words and figures went they were distinctly good, but the paper to an expert was impossible. Britannia was something of a travesty, and the notes being all printed from one plate, which had no ingenious contrivance with regard to the numbering, stood self-confessed impostors where two could be seen together.

Perhaps the most notable achievement of our more modern forgers is in the imitation of the water-mark, which is pressed upon the surface of the paper, instead of being part and parcel of its construction; and thus, though it passes muster in a casual observation, is not difficult to detect if carefully examined. Every possible improvement has been made in the engraving and printing of our current bank-notes, and the mills at Laverstoke are equipped with every modern device for the production of the unique paper; and though craftsmanship and science advance, alas! for the unjust as well as for the just, it has not at present been possible for the forger to produce a bank-note that will for a moment stand an expert test. The 'Promise of May,' as Mr Punch once facetiously dubbed a Bank of England note in the days when Mr Frank May was chief cashier, is a promise which, unlike that of many ladies, is never broken by the 'Old Lady of Threadneedle Street'; and it is safe to prophesy that the paper on which it is written will be as eagerly acquired in the future as it has been for the past two centuries. Indeed, few autographs are likely to be so generally collected by the public as that of the chief cashier of the Bank of England.

Chambers's Journal

SEVENTH SERIES

THE BIGGEST TREASURE HUNT OF THE AGE

By Mrs DECKER.

CHAPTER I.—THE ROMANCE OF THE *GROSVENOR*.

FOR nearly a century and a half romance, like a veil, has hung about the name of the *Grosvenor*, from the day of her tragic wreck till to-day, when it looks as if she will be forced to yield her treasures to the power of engineering skill and modern methods.

From time immemorial, sunken or buried treasure has held a wonderful fascination for human imagination; to-day the theme appeals as strongly as of yore; and there are many stories of efforts, successful or otherwise, to recover lost treasure. This fascination is not only because of the material recompense hoped for—more often it is the sheer love of adventure that is the strongest stimulant.

The call of lost treasure has always been strong, but it is only in comparatively recent years that science has taken a hand in the gamble, and that serious efforts have been made for the recovery of treasure which, like Paddy's kettle, was not lost, but only sunk.

The story of the *Grosvenor* is one of the most romantic on record, and is given an extra zest and halo by the fact that there is nothing mythical about it; from start to finish it is supported by solid facts.

In South Africa the *Grosvenor* is a household word, and her story is familiar to South Africans from their nursery days.

She was wrecked at Laambas—off the Pondo-land coast, between Port St John's and Port Shepstone. The *Grosvenor* belonged to the English East India Company, was about 800 tons burden, and was registered at Lloyd's as A1. She left India in April 1782 (the same year that the since salvaged *Middelburg* was sunk in Saldanha Bay), and had on board valuables, consisting of precious stones, specie, bullion, ivory, &c., of a value to-day of considerably over two millions sterling.

This is not a matter of conjecture, as is proved by the following extracts from documents dealing with the contents of the strong-room of the *Grosvenor*: 'The stones (precious stones, diamonds, rubies, sapphires, and emeralds), which are in 19 boxes, were valued at £517,000. The gold bars number 720, and value £420,000. The silver bars number 1450 (not valued), are

stored amidships, and specie (coin) to the value of £717,000 was stored in the lazarette, as well as the savings of the crew.'

Extract from letter from India Office: 'In addition to the information already supplied, it has been found that the Madras Government reported, in a letter dated the 25th March 1782, that an invoice of the *Grosvenor* amounted to star pagodas 162,378, and her register of diamonds to S.P. 24,444. The star pagoda at that time was worth between 8s. 2d. and 8s. 6d.'

Then, of course, the ship herself and her ordinary contents must have a certain commercial as well as sentimental value. It has been proved by other salvages that timber does not necessarily deteriorate by submergence in salt water; also, the copper on old-world ships counts for something, as they were as a rule coppered up to the bend.

Apart from these things that are certain, there are other possibilities in connection with what her hold contains.

Ever since she was lost there have been persistent stories that she also carried the two world-famed 'Golden Peacocks,' which were taken from the Diwan-i-Am at Delhi.

The Diwan-i-Am, or Hall of Public Audience, is a splendid building, measuring 100 feet by 60 feet, and was formerly plastered with chunam and overlaid with gold. The most striking effect now lies in its enrailed arches. It was in the recess in the back wall of this hall that the famous Peacock Throne used to stand, 'so called from its having two peacocks standing behind it, their tails being expanded, and the whole so inlaid with sapphires, rubies, pearls, and other precious stones of appropriate colours as to represent life.' Tavernier, the French jeweller, who saw Delhi in 1665, describes the throne as of the shape of a bed, 4 feet by 4 feet, supported by four golden legs, 20 to 25 inches high, from the bars above which rose twelve columns to support the canopy; the bars were decorated with crosses of rubies and emeralds, and also with diamonds and pearls. In all there were 108 large rubies on the throne, and 116 emeralds, but many of the latter had flaws. The twelve columns supporting the

canopy were decorated with rows of splendid pearls, and Tavernier considered these to be the most valuable part of the throne. The whole was valued at £6,000,000. This throne was carried off by the Persian invader Nadir Shah in 1739, and has been rumoured to exist still in the treasure-house of the Shah of Persia; but Lord Curzon, who examined the thrones there, says that nothing now exists of it, except perhaps some portions worked up in a modern Persian throne.

The story of these golden peacocks being on the *Grosvenor* has never been authenticated, as have others in connection with the ship. For obvious reasons these ornaments, if put on board, would not appear in her bills of lading; and as most rumours have at least some slight foundation of truth, it is possible that the 'Golden Peacocks' may be found when the *Grosvenor* treasure is salvaged.

CHAPTER II.—THE WRECK.

THE story of the actual wreck and the fate of the passengers and crew is a thrilling narrative. The particulars have been obtained from an account by Mr George Carter, written only seven years after the wreck, and from the records of the examination of John Hynes, one of the survivors, by the governor of the Cape at that time. Carter's book is now out of print, but the writer of this account has been fortunate enough to have had access to one of the rare copies in existence, for which courtesy she wishes to record her thanks and appreciation.

The *Grosvenor* sailed from Trincomali on the 13th of June 1782, and about a month later saw a sail, which was the only one that came into view till the unfortunate 4th of August, when the ship went ashore. One cannot but be struck with the difference in ocean traffic of those days as compared with the volume of to-day. All this only adds to the romance and mystery of the story.

Stormy weather prevailed for two days previous to the fatal day of the wreck, and probably no observations could be taken; doubtless, also, the strong currents helped to put the ship off her course. The day before the disaster, Captain Coxon told the passengers at dinner that he considered himself a hundred leagues from the nearest land, and he is said to have been a sailor-man of wide experience.

Early on the morning of the 4th August, two of the seamen on duty, John Hynes and Lewis, thought they saw land, and reported to Mr Beale, the third officer, who was in charge; but he only laughed at the idea, saying the nearest land was miles away.

As it got lighter, the sailors aloft again reported land in sight, but the officer would not believe them, and, in alarm, Hynes went

down below and reported to the captain, who immediately came on deck. Captain Coxon promptly ordered 'Ware ship'; but, alas! too late! the *Grosvenor* was on the rocks.

The scene of panic is more easily imagined than described. The small ship—800 tons—as compared with the ocean leviathans of to-day, was only a baby on the cruel rocks; gray skies and many clouds portended further bad weather; and, worst of all, the gigantic waves of the Indian Ocean, impelled by a strong wind blowing on shore, hampered all attempts for the safety of the passengers and crew.

At the spot where the salvage work is now being carried on the coast is a rough and rocky one, and in stormy weather the seas are mountains high; and, looking at the scene to-day, one can only wonder that any got ashore at all.

The carpenter was ordered to sound the pumps, and it was found that the hold was so far free from water. This gave a little more time for rescue work.

Then, as now, there were brave men at sea, and an Italian and a lascar managed to swim ashore with a life-line, to which was attached a hawser, and by this means the majority of the passengers and crew were saved. Before this a raft had been hurriedly constructed, but in such a heavy sea and amid such rocks it was useless, and was upset and smashed before it could be used.

A number of natives had assembled on the beach and were curiously watching the wreck, and when the line was got ashore they assisted in the rescue work. This encouraged the unfortunate crew, because the natives did not seem hostile, which was certainly something to be thankful for. The natives made off at sunset. They left the embers of their fires, for which the wrecked party were very grateful, as they had no means of lighting one.

In those far-away romantic days when there was no such thing as cold storage, vessels on long voyages had to carry their supply of fresh meat in live form. Such was the case with the *Grosvenor*, and some pigs and poultry were washed ashore; these provided a few days' food. Other provisions also came ashore, including a barrel of flour; also some sails, which were used to make rough shelters for the women and children.

On the morning after the wreck the natives again turned up, and seemed very curious, but not at all hostile. They contented themselves with stealing whatever they could lay their hands on, being particularly keen on metal of any kind. The writer of the story at that time says that the natives 'were woolly-headed and quite black,' which seems to us a rather unnecessary statement. Several casks of 'arrack' were washed ashore, and these Captain Coxon promptly stove in, for fear of its misuse and

possible results. Several days were occupied in collecting articles that might prove useful to the stranded party, while the natives carried off anything they fancied.

Captain Coxon was determined to try to get the people in his charge to the nearest Dutch settlement, which he thought could be done in about fourteen days.

One rather wonders why, with all he had at his command—timber and sails washed ashore—with a carpenter and his assistants among the men, the captain did not attempt the building of boats or rafts, and try to get round the coast to the Cape, for he would then have been in his element, instead of risking the unknown by making the venture overland. However, he decided on the overland trail, and on the 27th the luckless party started.

A man named O'Brien, who had an injured knee, elected to stay behind. He said he would get wire, pewter, and other metal from the wreck, of which he would make trinkets to trade with the natives, and when his knee was better would gradually work his way to the nearest settlement. He was never heard of again.

CHAPTER III.—THE TREK.

THE travellers, of whom there were about a hundred, found it weary work, and the lack of provisions soon had an effect on the strongest.

There were no roads, only an occasional Kaffir footpath, and as these did not lead in the direction the party wished to go, they were no help at all. The captain's idea was to keep near the seashore if possible, as shell-fish would provide the company with a certain amount of food.

They constantly met small bodies of natives, who were very annoying. The natives did not actually attack the white people, but harassed and robbed them in every possible way, and would not trade for food. Amongst one lot of natives whom they met there was a white man, who spoke Dutch, and said that his name was Trout.

Glad beyond words to see a white face at last amid all the trouble and anxiety, the spirits of the company rose, as it looked like the end of their vicissitudes. The captain asked Trout to guide them to the nearest settlement, promising ample reward, but the man refused. He said he was afraid, as the Dutch did not like him, and as the natives were fond of him, he did not think they would allow him to leave the kraal where he lived. As he seemed really frightened, and stoutly refused to go even near the settlement, the party came to the conclusion that he was probably a criminal, an outlaw for some strong reason.

Trout, however, gave them some rough direc-

tions as to the route to follow, the names of rivers and other places which might help to guide them. He advised them not to annoy the natives, but to try to remain on the defensive only, and so they might perhaps win through. He also warned them of the many dangers they would encounter—scarcity of food, treacherous rivers to cross, wild beasts and poisonous snakes. Tales of woe enough to daunt the stoutest heart!

As the weary days drew out their slow length things became worse and worse. The natives, who seemed to be always about in small groups, became more aggressive, and the white men had to be constantly on the *qui vive*; while at night wild beasts had to be guarded against, and big fires kept burning till dawn.

Then another catastrophe befell. The natives took by force their most valuable asset—namely, their only tinder-box, flint, and steel. From now onward the men had to take turns to carry firebrands, so that they should not be without the necessary protection at night. This was a worse plight than that of the biblical virgins, and kept every one on tenterhooks for fear of a mishap to the precious brands.

As was natural enough, after a while trouble of another kind arose. Some of the men objected to the slow travelling, hampered as they were with women, children, and several sick men. After some considerable discussion, it was decided to divide into two parties. The captain, first mate, the married male passengers, and some of the seamen remained with the women and children; while Mr Shaw, second mate, Mr Trotter, fourth mate, and the men who thought they could travel faster, resolved to push on ahead. The idea apparently was that thus they would reach a settlement sooner, and return with help for those handicapped with the women, children, and sick.

Hynes joined the company which pushed on ahead. The parting caused much regret, but seemed the best thing to do under the circumstances. In the course of their unguided wanderings the two groups met again several times, but finally separated, and after that Hynes could give no information about the captain's party, which, as a matter of fact, was never traced again.

After some days of weary journeying, the party Hynes was with again divided, he and about ten of the strongest men pushing on in the hope of being able to bring succour to the weaker ones. Still, the natives do not seem to have been actually hostile; after they had stolen all they could, they merely watched the strangers curiously, and irritated them in small ways. Had they been of a really blood-thirsty nature, all the whites would have been killed long ere this.

In the course of the narrative mention is made of large herds of elephants and the crossing

of huge forests. The tall grass is spoken of as a great hindrance to travel, as it was about eight or ten feet high, and prevented them from seeing their way.

In one of their slight encounters with the natives, Hynes got a wound in his leg and fell; his companions, thinking him dead, left him behind. After a while he recovered consciousness, and was able to follow and rejoin the rest.

After untold hardships the party was reduced to three—Hynes, Evans, and Warmington—but later they were joined by some of the men they had left behind. Many trying days followed; water was scarce and food almost unobtainable, as the natives would not give them any, and they had nothing with which they could barter, the natives having taken even the buttons off their clothes.

At last, when actually on the verge of despair, they met a Dutch colonist named Battores, who was out with a couple of black servants looking for cattle that had strayed. This man guided them to the settlement, where every possible

kindness was shown to the sick and tired wanderers.

From here they were assisted from place to place by cart, till they reached Swellendam. Here they remained while the deputy-governor, who lived at this place, sent a messenger to the Cape to ask the governor what to do with them. At this time Holland and Britain were at war: hence the precaution taken by the deputy-governor. This, of course, meant a long wait, but the men were glad enough to rest and recover from their awful journey.

In due course orders came from the governor that two of the men were to be sent to the Cape for examination, and the others were to remain at Swellendam meantime. Larey and Warmington were therefore sent to Cape Town. After their examination by the governor, they were sent to work on a Dutch man-of-war lying in the bay. Later, these two men were put on a Danish East Indiaman just as she was sailing, and were the first of the party to reach England.

A GIPSY OF THE NORTH.

CHAPTER II.—A DOUBTFUL STORY.

THE operation which the man on the beach suggested seemed simple enough to Roy Carwyke, but when he began to obey he discovered that he was not to be allowed to accomplish it without molestation. His heavy pack lay partly exposed and open to the fire in front, and the moment he tried to move it the hostile rifle in front cracked, and the bullet, striking one of his prospecting tools, ricocheted across the tundra.

'Confound the fellow!' he muttered, as by means of the straps he tried to drag the heavy pack out of sight of the man in front.

Twice during the operation the rifle spoke, and on each occasion the bullet passed within a few inches of him; but, retreating foot by foot and dragging the pack behind him, he presently reached the level of the beach, where he halted for a moment to strap the pack upon his shoulders.

'Slickly!' cried the man who had come to his help, from one of the boulders on the beach where he stood half-concealed. 'Those darned blubber-eaters may follow.'

Carwyke wasted no time. Once his pack was in place, he slipped from boulder to boulder until he was standing by the stranger's side. He had a swift impression of a tall and handsome figure, a masterful and swarthy countenance, with eyes that were eagle-like in their keenness; and then the man gave an abrupt laugh. 'Lively quarters for you up there on the spit! We'll fall back to the next finger of land, I think.'

Not another word did the stranger speak until they had safely traversed the short beach and were ensconced on the spit from which Carwyke had first seen the golden-haired woman. There the stranger lay for a little time, carefully searching the tundra through a small pair of glasses; then he dropped them and looked quizzically at Carwyke, who was lying a yard or so away.

'I thought the beggars might perhaps try to cut us off, but apparently they're satisfied to have driven us away.' He laughed as he thrust the glasses into their leather case, and added, 'Lucky for you I heard the shooting, and was able to pick you out with these! They'd have had you in the end.'

'I should have had some of them first,' answered Roy Carwyke, not boastfully, but as a man stating a matter of fact.

'A man of spirit, I see!' laughed the other. 'Well, I shall be able to find a use for you if you will come with me to my camp, which is a couple of miles across the tundra.'

Carwyke found himself resenting the other's masterful manner, and was inclined to repudiate the man's calm assumption that he would be willing to serve him; but, anxious to learn what was behind the extraordinary circumstances into which he had fallen, he checked the words which rose to his lips, and said acquiescently, 'Lead on! But there'll be a risk in crossing the tundra, won't there?'

The other man laughed. 'There would be if we ventured that way! But we shall crawl

up the bed of the stream that empties itself beyond the next point. It will be cold work, but not half so cold as a bullet in one's vitals.'

Without further remark the stranger turned and led the way down to the next beach, and, arrived there, accommodated his pace to that of the burdened Carwyke. He did not offer any explanation of himself, or ask any question of the man to whose help he had come—though once or twice Carwyke surprised him looking at him with calculating eyes. On his part Carwyke also maintained a stubborn silence. He had an impression that this dark-faced stranger was waiting for him to ask questions or to offer some explanation of his presence in the neighbourhood, and quite deliberately, notwithstanding the curiosity that he felt, he refrained from doing either. He would force the other to declare himself first.

Without further molestation they passed the point indicated by the stranger. Then the latter laughed. 'Time we introduced ourselves, I reckon. My name is Standifer—Kit for christening name.'

'And I am Roy Carwyke.'

Standifer nodded. 'A prospector, I suppose, from the tools you carry?'

'Yes,' answered Carwyke, without offering further information.

The other flashed a quick look, asking carelessly, 'How did you come to butt against the Eskimos?'

Roy Carwyke had seen the quick glance, and, notwithstanding the man's careless tones, knew from his manner that he was waiting for the answer with something like anxiety. Why? his mind asked, before he answered, but the answer itself betrayed nothing of his perception of the other's interest.

He laughed carelessly. 'Oh! I just walked on to their shooting-range, and I was the most surprised man in Alaska when I heard a bullet go singing over me. The boulder where you saw me happened to be handy, and I dropped in my tracks. Why the Eskimos should shoot at me, I can't guess.'

Standifer laughed as he led the way towards the river of which he had spoken, and then asked another question. 'Didn't see any of the blubber-eaters, I suppose?'

Carwyke shook his head, and said nothing of the golden-haired woman whom he had seen, and who, notwithstanding her attire, was certainly no Eskimo. 'Never one! Not even the beggar who was shooting.'

The dark-faced man laughed again. 'You were the victim of circumstances,' he said. 'That camp across the tundra just now is like a hornet's nest that some fool has stirred up with a stick, and the neighbourhood of it is blamed unhealthy for a white man!'

'Why?' demanded Carwyke, asking his first question. 'I don't know much about Eskimos,

but I've always thought they were a quiet, inoffensive lot.'

'So they are,' answered Standifer, 'so long as you don't stroke their fur the wrong way. Do that, and they'll boil over; and that crowd back there are fairly bubbling.'

'Why?' asked Carwyke again.

The other laughed. 'You'd see my ship from the point where you—'

'It was yours?'

'Yes! Piled up there three weeks back in a thick fog; and those blubbery beggars over at the encampment claim it as their own, with contents as per indents. They've queer notions of property, and what the sea throws up on this coast they regard as the direct gift of their filthy gods. But it isn't the ship or the property in her that keeps me in this ghastly neighbourhood. I should have quit and left it to them on the second day if I hadn't happened to discover that there's a white girl in their camp.'

'A white girl!'

Roy Carwyke's tone of surprise was perfect, and his companion laughed.

'Gets you, I guess, same as it got me. The girl is about eighteen, I should say, with cheeks like a peach, and hair that is like gold in the sun.'

'But what's she doing up here?'

Standifer shrugged his shoulders and laughed. 'Search me! I don't know, but I guess the beggars are keeping her in captivity; and that is why you, a white man, were not allowed to approach the encampment.'

'But——' Carwyke checked himself in time. He had been about to ask why, if the girl were a captive, she should have run away from himself. He began again, and it was a different question that he asked. 'But how can they have got hold of her?'

'Don't know!' answered the other laconically. 'She may have come up here in one of the whaling-ships and got left behind—or wrecked, like myself. There are a fair number of vessels cast away on this coast.'

The man's manner and his words had every appearance of frankness; but somehow Carwyke distrusted him, and certainly he did not believe the accounts given of the girl. If she were a prisoner, it was inexplicable that she should have been wandering alone on the beach where he had seen her; and it was even more inexplicable that she should have run away from a man of her own race to whom she might have looked for help. He kept these thoughts to himself, however, and answered easily, 'So I have heard, and it may be as you say. I suppose your idea is to get the girl away?'

'Well, no decent fellow could leave her where she is without making some attempt at it, could he?'

'I suppose not!' answered Carwyke, stealing

a glance at the other's face, and wondering how far the description of 'decent fellow' fitted him.

There was, he decided, something predatory about the man. Whether the eagle nose and flashing eyes were responsible for the impression or not, he could not decide; in spite of his dark handsomeness, the man reminded him of a bird of prey, and as he visioned that flying girl with her golden hair streaming in the wind, he was conscious of an increasing distrust of Standifer.

'That's why I've hung on here. There are four of us—all that came out of the wreck—and if we can count you in, there'll be five; and five white men with modern rifles ought to be able to thrash any gang of blubber-eaters from here to Herschel Island.'

'But they have rifles too!' said Carwyke. 'And one of them's a marksman. If you had lain behind that chunk of rock where I was, you'd have no doubt of that.'

'Haven't any now!' laughed Standifer. 'But five of us could walk through them, and five of us there'll be—if you are not afraid.'

There was something like a sneer in the last words, but Roy Carwyke ignored it. 'Oh!' he said lightly, 'I don't mind a scrap, and you can count me in if it's a case of saving a white girl from a crowd of heathen.'

'I thought you'd see it that way,' said the other, thrusting out a hand. 'Shake!'

Carwyke took the hand that was offered him, and shook, looking the man straight in the face as he did so. For the fraction of a second as his eyes met the flashing dark ones the latter flickered; and for all Standifer's apparent frankness, Carwyke decided that the man was to be distrusted. He was concealing something. He knew more about the white girl than he had told, and there was some mystery here that would pay for probing.

As they walked through the ice-cold water, keeping as far as possible in the shelter of the low banks, Roy Carwyke wondered what the mystery was. That it centred round the girl who had fled from him was the only certainty that he could reach; and he was still wondering when they came in sight of a roughly-constructed tent, made from a sail and light spars. Standifer indicated it with a nod. 'There's journey's end!' He lifted up his voice, and sent out a warning hail. 'Boys! Look out!'

Instantly, three men rushed from the tent with rifles in their hands and with every sign of trepidation in their manner, and Carwyke easily divined that they lived on tiptoe of expectation of an attack. The man by his side laughed. 'That made them jump, I'll warrant.'

He waved a hand reassuringly, and the men, dropping their rifles, awaited their coming. Standifer led the way up the low bank and across the soaked moss to the tent. Arrived

there, he made a laughing introduction. 'A new recruit, boys—Mr Roy Carwyke, anxious to help us to lift that white girl from the clutches of the blubber-eaters!'

As he spoke there was an almost droll note in his voice, as if he found something amusing in the situation; and, turning his head quickly, Carwyke caught the tail-end of a wink, which deepened his distrust infinitely. He knew as well as the men for whom it had been intended that Standifer had by that wink meant to give to his lightly-spoken words a significance other than their face meaning, and understood perfectly that the man was conveying to his friends the fact that the new-comer was in ignorance of the real situation, whatever that was; but he gave no sign of his understanding. One of the three men laughed, and stepped forward. 'I guess we can do with recruits,' he said. 'There's too many o' them oily beggars around, an' they've got guns.'

'Carwyke knows that already, Bull,' answered Standifer. 'He's had a taste of their quality. When I found him, he was lying at the back of a rock watching a display of fancy shooting.'

'Heard their guns,' chimed in another of the men, 'an' wondered what the game was. Guess we're glad to see yer, Carwyke.'

'Better slip off your pack, hadn't you, Carwyke?' asked Standifer. 'Having joined with us, you're free of the tent, and of anything else about the camp. We'll grub first and talk afterwards.'

A meal was already in course of preparation inside the tent, where a mosquito-bar had been rigged, and, seated upon his pack, Carwyke took stock of his new acquaintances. They were, he decided, a most unprepossessing trio. The man addressed as Bull at some time had suffered an accident which had left him with a broken nose and a badly scarred face; whilst one of the others had a cast so villainous in his eyes that inevitably one distrusted him. The third man, who had remained silent at the introduction, was different. Tall as Standifer himself, lean as a stick, with a face that, notwithstanding it had been ravaged by mosquitoes and was badly swollen, was an intellectual face, he was apparently nearer Standifer's own station than the other two; and as he crouched in the smoke of the smudge which was burning in the tent he stared at Carwyke with sombre eyes for a time, smoking and not speaking. Then suddenly he broke silence. 'You're a prospector, I suppose?'

The cultured voice told Carwyke that he had guessed right when he had placed the man in a different category from the other two. 'Yes!' he answered quietly.

'A rotten game! I tried it once upon the Koyokuk. Nearly went mad with the loneliness, lost my grub through wrecking the canoe, and if Standifer hadn't happened along, I should

have crossed to kingdom come.' He broke off thoughtfully, exterminated a mosquito which had settled on his hand, and then added bitterly, 'Might have been better if I had!'

Carwyke looked at him with interest, wondering what there was in his life to move him to such a reflection; then, thinking that the man seemed disposed to be communicative, he ventured a question. 'Standifer is an old-timer, then?'

For one moment a gleam showed in the sombre eyes, and a smile wrinkled the ravaged face. 'If you want to know anything about Kit Standifer, you'd better ask him!' He laughed mirthlessly as he gave this brutally direct hint, and added, 'He'll tell you just as much as he may happen to think good for you.' Having said so much, he lapsed into silence, and did not speak again until they were half-way through the meal, which the man Bull and his companion had prepared; and then it was to ask a question. 'You don't expect to find gold up here, Carwyke?'

'No!' laughed Carwyke. 'I'm going back to the hills.'

'But you'll help us to clean out the Eskimos first?' asked Standifer sharply.

'I'll help to rescue the girl,' replied Carwyke.

'Same thing!' commented the other, with a harsh laugh. 'There'll be fighting before they let her go, as you ought to know from your recent experience.'

To that Carwyke made no reply, but, as he ate, he listened carefully to the desultory talk of the four men, in the hope of learning something of their real purpose; for he was sure that the girl whom he had seen was free to leave the Eskimo camp at any time. He discovered nothing, however, and watching Standifer, who was clearly the leader of the party, a thought came to him, and he asked suddenly, 'What were you doing so far north when your ship was wrecked?'

Standifer laughed easily. 'Trading with the Eskimos. Between that and a little seal-poaching there are quite good pickings on this coast, if one knows where to look for them.'

The reply was plausible enough; but, though he did not show it, the prospector doubted its truth. Standifer was scarcely the kind of man to seek his livelihood by bartering with natives; and that there was some other explanation of his presence on this desolate coast, Roy Carwyke was convinced. What it could possibly be, except that somehow it concerned the girl in the native camp across the tundra, he could not think, cudgel his brains as he might.

And it was not until some hours later, when he was supposed to be asleep, that he got any hint of the truth at all. The man Bull was somewhere out on the tundra keeping watch against any possible attack by the Eskimos; the cast-eyed ruffian was snoring so loudly as to drown the steady drone of the mosquitoes, when

a head was thrust against the mosquito-bar, and in the rosy light of the midnight sun Carwyke made out Standifer's eagle-like features. A second later the face was withdrawn, and he caught the sound of a dry laugh, followed by a whisper.

The other man, whose name he had learned was Mardock, laughed in answer, and then asked a question. 'Are you going to tell him the truth, Kit?'

'No!' answered Standifer brusquely. 'Why should I? He might cut up rough.'

'But you're going to use him?'

'Of course! He's a pretty cool hand, I should say, and in the rough house that's coming he will be useful.'

The voices moved out of earshot, and with every sense alert, and his brain working rapidly, Carwyke sat up quietly. What was the truth, and why should it be withheld from him? Why should Standifer think that he might cut up rough if he knew the real facts of the situation? He could find no answer to these questions; but the few words which he had overheard confirmed the suspicions that he had already entertained. There was but one way of solving the mystery in which he had become involved. To ask Standifer himself would be of no use. If he had read the man aright, he would be merely laughed at, and told that he had been dreaming. But the girl herself, if she were assured of his friendliness, might have no hesitation in extending to him her confidence.

Quite suddenly his resolution was taken. He would leave Standifer and his rather unsavoury companions and make his way to the Eskimo camp across the tundra. The dangers of that course were obvious enough. Approaching the Eskimo camp he would be liable to be shot, as his experience of the afternoon told him; in leaving his present company he ran the same risk, for Standifer was not the man to stand on ceremony or to be deterred by scruples. But if he could creep away and get a sufficient start, he might be able to convince the hostile Eskimos of his friendly purpose, and the mystery of that golden-haired girl drew him like a magnet.

He looked at his companion in the tent, who was still snoring loudly. There was nothing to fear from him. Taking out his knife, he made a slit in the canvas on the side from which the voices had reached him. Opening it with careful fingers, he peeped cautiously. Standifer and Mardock were some three hundred yards away, their backs to the tent, apparently in earnest conversation. For a moment he hesitated. Three hundred yards was not a very great start if they observed him; and, burdened with his pack, which he dared not leave, he would have small chance of escape if his desertion were observed.

The two men, still conversing, began to move

forward, and convinced that there was no likelihood of their immediate return, he set his pack upon his shoulders, buckled it, and lifting the mosquito-bar, slipped out of the tent. Standifer and Mardock still had their backs to him, and with a feeling of exultation, keeping the tent between himself and the now distant

pair, he crept across the tundra, and then slid down the low bank and began to walk downstream. Two minutes later a turn of the river hid the tent from view, and making all the speed he could, he marched in the direction of the beach.

(Continued on page 40.)

HISTORIC CONSTABLESHP IN SCOTLAND.

By D. M. ROSE.

I.

THE constableness of an ancient castle was in the olden days regarded as one of the most honourable offices that could be conferred on any individual. A constable was practically supreme in his own locality, wielding tremendous power if his jurisdiction devolved from the Crown. He 'rode' the fairs, keeping order, levying dues, or impressing men or produce for his garrison. At his own sweet will he could preside over provost and magistrates, or supersede their ordinances if in any way detrimental to the security of his charge. Only one or two cases can be cited where Scottish constables abused their privileges and acted oppressively: then only in time of great perplexity. Many of the old hereditary constablerships in Scotland were recovered to the Crown, or abolished under the Heritable Jurisdiction Act of 1747. But a good many genuine constablerships remain to this day, for a ruling of the Court of Session made it perfectly clear that the Act of 1747 affected only those constablerships having jurisdiction from the Crown—especially such as were granted since 1457; 'the Act did not abrogate constablerships emanating from subject-superiors.' Here we deal only with those for which compensation was paid or claimed under the Act of 1747.

One of the most amusing of these compensation claims was that presented by Sir Andrew Agnew of Lochnaw, whose ancestor, Andrew Agnew, had a charter of the constabulary of Lochnaw from William Douglas of Leswad on 16th November 1426. Sir Andrew in 1748 claimed £1000, as he regarded the office as of the 'greatest consequence to his family,' although he was uncertain as to the castle from which he derived right. He had an idea that the office was connected 'with the remains of an old castle in a little isle in the loch of Lochnaw,' and he had a vague notion that his predecessors were wont to 'ride' the fairs at Wigtown, naïvely adding: 'For aught I know I am entitled to do so at this day.' Counsel for the Crown briskly opposed the claim by roundly declaring that the 'grant was never good for anything'; so the Court of Session on 7th January 1748 decided that Sir Andrew

Agnew was not legally possessed of the constablership as at 11th November 1746, and was therefore not entitled to compensation.

George, Marquis of Annandale, claimed £1000 sterling in respect of the historic constablership of Lochmaben, the magnificent ancestral home of the Brus family from 1124. The castle was a princely pile of buildings covering over sixteen acres of a semi-island on the shores of the loch. It was really on a peninsula cut off from the mainland by several moats. A wealth of legend and story circles round this great castle. In the stirring time between 1291 and 1384 it was the scene of many thrilling incidents, being then the most important fortress on the Border, forming a mighty bulwark at the south-west entrance to Scotland. It was captured and retaken many times by English and Scots. In July and August 1299 Robert Brus, Earl of Carrick, vigorously assailed it for twenty-five days, but failed to carry it by assault, although he invested it so closely that Sir Robert Felton, the constable, could not get out to buy himself some clothes! It was at this time that the inner palisade was made in the close of the castle by the forced labour of the men of Annandale. English records still preserve the names of the knights and esquires who defended the place, together with references to their men-at-arms, 'hobelars,' and barbed horses. After Brus had killed Comyn he fled to Lochmaben, but Edward I. granted it and all his lands to the Bohuns on 20th October 1306. When fortune favoured King Robert Brus, he bestowed the lordship of Annandale on his nephew Ranulph, Earl of Moray. It would take up too much space were we to give the stirring history of Lochmaben during the struggle for possession by Ranulphs, Beaumonts, Cliffords, and Percies. It was only in 1384 that the Earl of Douglas finally wrested it from the English, and on the forfeiture of the Douglasses in 1455 it became a royal castle. Later on the Earls of Annandale were constables, and as such levied thirty-two 'lardner kine' out of the parishes of Meikle and Little Dalton and Dryfesdale for £40 Scots each. They also exacted levies out of Cummertrees and other parishes. The Marquis of Annandale in 1748 produced

decreets against the heritors of the various parishes from 1680 onwards, yet in spite of the array of documents the Lords, on 8th February 1748, decided that there was insufficient evidence that the marquis possessed the constabulary 'as at 11th November 1746, and therefore he was not entitled to compensation.'

The Earl of Cassilis claimed a modest hundred pounds sterling for the constabulary of the ancient castle of Loch Doon, in Ayrshire. This historic building stands on a rocky islet in Loch Doon, being an almost secluded impregnable fortress. It was one of the strongholds of the family of Carrick, and after Brus's defeat at Methven several of his adherents fled to seek refuge in this castle. But it was surrendered to the English by Sir Gilbert of Carrick, who was forfeited by Brus for this betrayal of his trust. Later on Brus restored him. During the Baliol attempt in 1333 Loch Doon was one of the few castles which held out for David II., its constable being John Thomson, a valiant soldier of fortune. Many terrible incidents were witnessed within its walls. The Earl of Cassilis in 1748 founded his right principally on a charter in 1642 and later deeds, but counsel for the Crown made fun of the claim, saying the jurisdiction was worth no more than that over Ailsa Craig: 'the birds of the air being the only inhabitants.' The Lords of Session, taking a similar view, decided against the earl on 5th February 1748.

On the same day the Court dealt with the claim of the Earl of Bute for £1000 sterling as value of the constabulary of Rothesay. These ivy-mantled ruins of Rothesay possess historical associations, the castle being one of the peculiar oval-shaped fortresses of an early period. It is said, indeed, that the builder was Magnus Barefoot of Norway in 1098. Since then it has been the scene of many a siege, both Norse and Scots contending for its possession. It played an important part during the War of Independence, when much fighting took place in the vicinity. It was a favourite residence of some of the Stewart kings, on account of its genial climate and beautiful surroundings. In 1409 it was annexed to the principality of Scotland by Act of Parliament. Later, the castle suffered severely on many occasions, especially at the hands of Cromwell; while Argyll burnt it down in 1685. From the proceedings in 1748, it appears that the Earl of Bute's ancestor, Ninian Stewart, was infeft in the office of constabulary on 16th July 1499; but the Crown objected that Stewart was merely captain, and that the deeds exhibited in process—especially the charter of 1703—could not alter the nature of the office. Further, as the earl was to retain the salary attached to the office, and the castle itself was to continue his property, he could not claim value in money.

The Earl of Eglinton considered £1000 sufficient for his constabulary of Eglinton and

regality of Montgomeryston; while George, Lord Ross, thought £500 ample for his rights as constable of Renfrew. His family held the heritable constabulary of the castle of Renfrew for many generations, long before the grant of 1447. But charters under the Great Seal in 1548, and even the parliamentary ratification in 1669, failed to impress the Lords, who decided that George, Lord Ross, was not 'entitled to any jurisdiction over the burgh of Renfrew, nor to any compensation.'

II.

One of the most interesting cases before the Court was that of Dunstaffnage, a castle grown hoary with antiquity. It is said that in the distant ages the Dalriadan kings of the 'black Scots of Lorn and Argyll' had a residence at this place, which simply teems with regal associations. Anyway, the castle dates from the twelfth century, and since then it has stood like a grim sentinel on the precipitous rocks of the sea-girt peninsula at the entrance to Loch Etive. Robert Brus began his campaign by capturing Dunstaffnage from Alexander of Argyll, and he bestowed the constabulary and mains thereof on Sir Arthur Campbell. It has had many royal visits, and it was here that the rebel Earls of Douglas and Ross hatched their treason in 1455. In troublous times it has always been held for the State, even so late as 1745. It came to the Argyll family by marriage with the co-heir of the Stewarts of Lorn. A family of Campbells held the hereditary captaincy of Dunstaffnage, and Neil Campbell of this line claimed £500 in 1748 for his bailiary, coronership, and constabulary of Dunstaffnage. By ancient custom the family apparently exercised the privileges of constabulary by levies on the tenantry. On the arrival of unexpected guests they hoisted a tablecloth on the flag-staff as a warning signal to the surrounding tenants to bring in supplies! But a charter of 18th October 1681 was the earliest writ produced, and it had little weight with the Lords. Indeed, the Court made short work of most of the Campbell claims. In the Dunstaffnage case the Lords decided that no constabulary was attached to the castle; that the tenure of mairnichtie—that is, coronership—by which the captaincy was held, had lapsed. This captaincy was probably legally restored a few years ago when Mr Niall D. Campbell, now Duke of Argyll, solemnly invested Mr Angus Campbell as captain of Dunstaffnage, and gave him a key as insignia of office.

Thomas, Earl of Strathmore, claimed £2000 for the constabulary of Forfar and Kinghorn. These places were of vast importance during the War of Independence. In those troublous times marauding bands of Highlanders overran the district, and although they burnt the castle of Forfar in 1306, the constabulary existed for generations after the total disappearance of the

building! Some delay arose in 1748 in dealing with this claim, the earl pleading that he was not in possession of his family papers. When these were recovered he made out such a good case that the Court decided he was legally possessed of the constableness and entitled to £600 as compensation.

John, Marquis of Tweeddale, was not so fortunate with his claim for £1000, value of the constableness of Dunfermline. Although kings have sat 'drinking the blood-red wine in Dunfermline toon,' it was the queens of Scotland who were ladies of that ilk. Tweeddale traced his constableness by progress of titles from a charter of 3rd April 1611 granted by Queen Anne as 'Lady of Dunfermline' in favour of Alexander, Earl of Dunfermline, of the lands of Outh and others, together with the heritable office of constableness and keeper of the palace of Dunfermline. The earl's production of royal and other charters proving the descent of lands and office into his possession did not influence the Court, for the Lords, on 20th January 1748, found that there was no jurisdiction attached to this office, so no compensation was due. Archibald, Duke of Douglas, fared much better in his claim for £6000 sterling as compensation for the constableness of Dundee. The Court awarded him £1800 sterling in 1748, so that the office was recovered to the Crown, and the present Earl of Home is not hereditary constable of Dundee, as some folk have tried to make out. A constableness existed at Brechin since the days of Bruce, but no claim was made by the Maules of Panmure in 1748. In the case of Montrose, the Court of Session decided that Lord Dun was lawfully possessed of the constableness of Montrose, and was entitled to £500 sterling as value thereof.

Kinclaven Castle, about eight miles from Perth, was one of the most ancient of the royal residences in Scotland. It was a favourite resort of Alexander II. and his son. In 1264 there is mention of the carriage of wine to the castle. All that now remains is a square enclosure, with walls about twenty feet high, standing on a steep bank on the right of the Tay opposite the mouth of the river Isla. In the days of the fight for Scottish freedom it was a place of considerable strength, and time and again it was taken and retaken by both English and Scots. King Edward I. resided here in June 1296, but in the following year Wallace captured Kinclaven after inflicting a severe defeat on the English. He and his comrades spent a week in plundering the castle; and then, following the Scottish custom in those trying times, he burnt the place, leaving it, as Henry the Minstrel records, a mass of smoking ruins with broken walls. The English regarded it as of such importance that they promptly restored it, putting it into such habitable condition that later on Edward II. resided here,

and in 1335 it was once more held on behalf of the English. But in 1336 the Scots stormed and captured it. From this time forth it continued Crown property until James VI. disposed the lands to John Stewart, who on 10th August 1607 was created Lord Kinclaven and constable of the castle. He afterwards became Earl of Carrick. Upon his death the lands and constableness were granted to Robert Leslie for the space of two nineteen years. Leslie assigned his right to Sir William Stewart, from whom the lands and office came to William Bruce. During the troubles in 1648 Bruce and his tenants suffered such severe losses that this family gladly parted with the lands. They next came to the Earl of Tullibardine, the Marquis of Atholl in 1681 having parliamentary ratification of the lands, castle, and hereditary office of constable. James, Duke of Atholl, in 1748 claimed £700 for the constableness of Kinclaven. He also claimed £900 for the heritable constableness of Huntingtower, of which the Murrays of Tullibardine were appointed constables by King James VI. on the forfeiture of the Ruthven family for their share in the Gowrie conspiracy. The lands had been given to William Murray, a Gentleman of the Bedchamber; for a short time they were held by Robert Bruce of Gellat, who had ratification in 1645; but the lands were afterwards dissolved from the Crown, and on 7th September 1662 Parliament ratified a grant of the lands and constableness in favour of the Earl of Tullibardine. The Atholl family were also hereditary constables of Falkland, of which they had parliamentary ratification in 1662. James, Duke of Atholl, claimed £2166, 13s. 4d. for the constableness of Falkland and Stewartry of Fife.

III.

The historic office of constable of Aberdeen dated from very early days. Throughout the stormy times in the War of Independence John de Guidfride was constable. The office became hereditary in the family of the Kennedies of Carmeuk, from whom it descended to Sir John Forbes of Waterton, who on 4th August 1669 had a charter under the Great Seal of the lands of Ardgrave, with all privileges and profits thereof. His descendant, Thomas Forbes of Waterton, sold the lands and office to James Gordon, senior, merchant, Edinburgh, and to William Gordon, his son, on 18th September 1706. In 1748 James Gordon of Ellon claimed £1000 as value of the office; but although he had special retour as the heir of said William Gordon, his brother, the Lords on 24th February 1748 determined that James Gordon was not lawfully possessed of the jurisdiction of constable of Aberdeen.

Another very ancient constableness was that of Cullen, which James, Earl of Findlater and Seafield, valued at £2000. He maintained that his predecessors were constables of Cullen for

centuries, and that the charter of 25th June 1481 produced was not the original grant. The office had annexed to it the privilege of nominating one of the bailies of Cullen, and it also conveyed the right—usually held by constables—of presiding at meetings of the Town Council. He contended that he was entitled to the office by grants from the Crown ratified by Parliament, as well as by immemorial possession. On 28th January 1748 the Court of Session, in 'respect of the documents of possession produced, found that the earl was lawfully possessed of the constabulary of Cullen, and was entitled to reasonable compensation,' which they fixed, on 18th March 1748, at the sum of £600 sterling. Cullen was a favourite resort of the Brus family.

The ancient castles of Spynie, Darnaway, and Lochindorb have constabularies attached to them, which, however, do not concern us, as no claims were made in 1748. A constabulary of Nairn existed from ancient times. Robert Brus, who was hereditary forester of Moray, frequently resided at Nairn, and was in Moray for a considerable time. He also lived at the old castle of Auldearn, now a grass-grown mound. In the War of Scottish Independence the castle was one of the strongholds in the hands of the English. It was captured by Sir William Rose of Kilravock, whose family for many centuries supplied provosts to the burgh; but the hereditary office of constable was held by the Calders, thanes of Calder, from whom it came to the Campbells. Sir John Campbell in 1748 claimed £500 for the office, although the castle had vanished long before 1600. He founded his right upon an instrument of Sasine, 15th November 1426, in favour of Donald, thane of Calder, of the office of sheriff and constable of Nairn. This deed proceeded upon a precept by the Duke of Albany, 11th July 1405, following on Donald's special retour as heir to his father, Andrew of Calder. Sir Hugh Campbell had ratification of the office in 1672; but although Crown counsel admitted immemorial possession by the family, as well as confirming grants by the Earls of Ross and the Crown, the Lords of Session on 19th February 1748 decided that Sir John Campbell was not entitled to jurisdiction or compensation.

In the same way the Duke of Gordon failed to establish his claim to compensation for the constabulary of Inverness, which he valued at £300 sterling. This office existed from days beyond record, for a castle was perched on the high bank commanding the passage of the Ness before the dawn of history. The constabulary became hereditary in the family of Gordon by grants from the Crown. For many generations the Earls of Huntly and Dukes of Gordon, by right of this office, held extensive lands in the neighbourhood, continually exercising various privileges, besides appointing

deputy constables. The Duke of Gordon also had a parliamentary ratification in 1685; yet, in face of the evidence, the Lords in 1748 found that the constabulary of the castle of Inverness did not appear to have any jurisdiction annexed thereto, or that such jurisdiction was ever exercised, and therefore the claimant was not entitled to any satisfaction on account thereof. No claim was made in respect of the ancient constabularies of Torecastle and Inverlochry in Lochaber; nor was any claim made for the constabulary of Beaully Priory, held for generations by the Lords Fraser of Lovat.

A very ancient office of constabulary was attached to the castle of Cromarty, which was possessed by a long line of Urquharts of Cromarty. On several occasions they exercised rights of constabulary in very drastic fashion. The office passed from them to the Mackenzie Earls of Cromarty, who had ratification. In 1748 the office was claimed by William Urquhart of Meldrum, who valued it at £200 sterling.

IV.

Other two local cases not before the Court may be dealt with here. It has always been said that the Baynes of Tulloch were hereditary constables of the castle of Dingwall, and the Seaforths constables of Fortrose or Chanonry. It is true that the Baynes had been constables of Dingwall, and although no claim was made in 1748, the matter is important, because it is asserted that the Davidsons of Tulloch are constables of Dingwall. The truth is the hereditary constabulary of Dingwall was acquired by Richard, Earl of Desmond, who assigned twenty merks yearly out of the lands of Kinnairdie for repairing and maintaining the castle, which had withstood many historic sieges. On the death of the Earl of Desmond, his daughter Elizabeth, Viscountess Thurles, and her husband, Viscount Thurles, were regularly and legally entered in the lands and office; but on 29th July 1634 the lands and the barony of Dingwall, the castle, &c., with the said office of constabulary, were appraised from Viscount and Viscountess Thurles by David Preston of Whitehill, who was their creditor for 27,625 merks of principal, with the interest thereof. Preston was duly infeft in the lands and constabulary on 10th and 14th May 1636; but when he, in the same year, granted precept for infefting George, Earl of Seaforth, in the lands, he specially reserved to himself 'the castle and fortalice of Dingwall, with the constabulary and fees thereof.' So far as can be traced, David Preston never denuded himself of the castle or office, although in later deeds there is mention as if the Baynes acquired the office. On 3rd April 1749 there is a decret of the Court of Session appraising from Kenneth Bayne, last of Tulloch, 'the office of constable of the castle of Dingwall, with all fees, salaries, &c.'

The constabulary of Chanonry is doubtful; but every one has heard about the constableness of Eilandonan, which is a perfectly genuine historic office, although not affected by the Act of 1747. This office seemed to be hereditary in the family of MacMurchie of Conchra. On the revival of the office, it was objected that an owner could not be constable of his own castle, but records prove that a good many owners held the constabulary of their own castles. For instance, the Grays were hereditary constables of Skibo Castle, but they lost the office and castle when their estate was sold by decree of the Court of Session in 1744. Yet their constableness came down through successive owners—by legal title from the Court of Session—to the Dempsters. In 1748 the Earl of Sutherland claimed £200 sterling for *his* office of constabulary of the castles of Skibo and Dornoch. He produced a charter of the hereditary constabulary from Robert, Bishop of Caithness, in 1557. Another writ produced was a charter by Bishop Robert in 1564, in favour of the earl's ancestor, appointing him constable on the narrative that the castles being 'built in an Erse country amongst wild and unbridled, fierce and barbarous Scots,' the bishops could not enjoy peaceful possession. Skibo, in spite of the Bishop Robert's sweeping statement, was a spot suggestive of repose and culture. The old castle was beautifully situated amid sylvan glades and tree-girt enclosures, and from early times it seems to have nestled cosily amid the trees. As to Dornoch, only the north-west tower of the castle remains; it has been sadly shorn of its glory, but in the days of its ancient splendour it had a courtyard, close, and spacious gardens and lawns. In the claim,

Dornoch was on the same footing as Skibo. The Lord Advocate, for the Crown, objected that it did not appear by the charter on resignation in 1706, or by the practice which followed thereon, that any kind of jurisdiction belonged to these constabularies, and as the earl's salaries and allowances were to be continued, this was more than a sufficient recompense. The Lords of Council, on 9th January 1748, found the Earl of Sutherland's claims incompetent, and that no compensation was due.

The Lords also, on 10th February 1748, found that George Sinclair of Ulbster was not entitled to £1000 claimed by him as compensation for the constableness of the palace of Scrabster. He derived his 'right' from a charter under the Great Seal dated last of January 1673, in favour of John Campbell of Glenorchy, afterwards Earl of Breadalbane, which, among other offices, contains that of constable of Scrabster—proceeding on a resignation by George, Earl of Caithness. The title came from Breadalbane to John Sinclair of Ulbster on 28th March 1719, and the said George Sinclair was retoured son and heir of this John upon 23rd June 1739, and had charter under the Great Seal on 28th July thereafter. Yet these documents were of no avail.

In face of the documentary proofs produced by many of the claimants the decisions of the Lords of Session are difficult to understand. There was no doubt great laxity on the part of agents drawing up these claims, but even before the cases came into court there is ample evidence that the judges had decided that the total jurisdiction claims, which amounted to £582,990, 16s. 8d. sterling, should be reduced by one-fourth.

VASES OF THE ANCIENTS.

By ERIC WINGFIELD.

ONE of the most beautiful of ancient objects of adornment, exhibiting great artistic skill, and often costly in composition, is the vase. We get the term from the Latin *vas*.

Vases were frequently given as prizes in the public games, or contests, of the ancients. They adorned the houses of the wealthy. They accompanied them to their tombs; not, however, as receptacles for ashes, as might naturally be supposed, but rather as an indication of rank or office. This appears evident from the subjects chosen for painting and decoration—frequently sacrifices, processions, and matters connected with the mysteries of Bacchus or Ceres. These were probably sacred vases, presented to the initiated, who had held some office of employment at the festivals of these divinities. Some also have been found with representations of family feasts, games, or heroic characters. In

Athenian tombs, built of brick or rough stone, and just wide enough to contain the body and its accompaniment of vases, five or six of these vessels stood around, or were suspended on the walls. They varied in size, beauty, and number; which appears to indicate gradations of rank.

The earliest known vases were of clay; those of glass, and cameo-glass, came later. The first clay vases were crude in form; but a gradual improvement in design supervened, and the materials used were more costly. Grecian artists, with their instinctive sense of beauty of line, adopted those forms which would please an artistic eye. They frequently took as a design the parallelepipedon—that is, a regular solid bounded by six parallelograms, the opposite sides being equal and parallel. They favoured also a circular shape, or one slightly curved,

thus avoiding angles and corners. Later, when art began to decline, we find these simpler forms abandoned. The pyramidal or angular took their place.

The ancient terra-cotta vases have generally been styled 'Etruscan,' but quite wrongly. The fact is that the great majority were not found in Etruria, but were gathered from the tombs of Capua, Nola, Santa Agatha, from cities of Græca Magna, and, as already mentioned, from Athens. Many of these are of great beauty. Nowadays a considerable trade is carried on (especially in Lower Italy) in the imitation of these ancient vases. The modern tourist is very liable to be victimised by the imposition.

But the most beautiful of all vases are those of cameo-glass, the earliest examples of which are amphora-shaped. The amphora is a vase with a double 'ear' or spout, and has two handles. Two superb specimens in this design are the 'Naples,' so called because it is possessed by the Naples Museum, and the well-known 'Portland' Vase, in the British Museum. The latter was first known as the 'Babini' Vase, Babini having been the family name of Pope Urban VIII., in whose pontifical reign it was discovered. The vase was found in 1644 in the monumental tomb of Alexandra Severus and Julia Mammæus, which was erected about three miles from Rome, on the road to Tusculum. The date of the sepulchre would be about A.D. 235; but the vase itself, 'being in the finest style of Greek art,' is considered to belong to an earlier period—that is, about 150 B.C.

In the eighteenth century the Babini Vase was in the possession of Sir William Hamilton, the diplomat who married the beautiful Emma Hart, so frequently painted by Romney as Lady Hamilton. Sir William sold it to Margaret, Duchess of Portland, who possessed a most wonderful collection of china, glass, &c. This collection was sold in 1786, when there was some sharp bidding between Josiah Wedgwood and the Duke of Portland (the son of Duchess Margaret). It is recorded that when Mr Wedgwood had bid as high as a thousand guineas, the Duke crossed the room to ask why he wanted it so much. On learning that it was only that he might copy it, the Duke said he would lend it to him for the purpose, and for as long as he required it, if he would allow him to be the purchaser. Mr Wedgwood accepted the offer, and the vase was knocked down to the Duke. Eventually it was presented by his Grace to the British Museum, where it soon met with an extraordinary fate, for it was 'smashed into a thousand pieces by a demented fool.' You can see in the Gem Room (where the vase now stands) a picture of the fragments, as they were all spread out singly, preparatory to reconstruction; for, incredible, impossible, as it must have appeared,

the vase was reconstructed—with infinite patience and the most exquisite skill. Indeed, it now appears almost as beautiful as ever. A stalwart policeman stands on guard in the room all day long. The colour of the vase is a deep, sapphire-blue; the cameo decorations, which are in relief, of an opaque white. There is a piece from the bottom of the vase, which was not replaced in its original position (where no one could have seen it), but is exhibited alongside the amphora. It represents a beautiful head of a man wearing a Phrygian cap.

There is a copy of this famous vase in the Birmingham Fine Art Gallery, which was made of the same materials by Mr Northwood of Stourbridge. Mr Wedgwood, by the way, made fifty copies in his jasper ware, which he sold at £50 each; but the cost of the production far outweighed the purchase price. One of these copies is preserved in the Gem Room.

Two other vases, as beautiful as they are famous, may be mentioned, which are known as the Naples Amphora and the Auldjo Vase, the latter being in the British Museum. Both these treasures were discovered at Pompeii. Naples having been one of the chief glass-making centres of Italy, it was fitting and proper for the amphora to be placed in the great Neapolitan Museum. Its colours are the same as those of the Portland, sapphire-blue and white. The cameo decorations are particularly charming, representing vines, with children gathering and carrying grapes, browsing goats, and masks, the whole forming an object of the greatest beauty.

The Auldjo Vase is of the shape known as *œnochoë*. It is what we should call in simple language a jug; stout in the body, with a neck which curves inward and then outward, with a tall handle making a sort of crook above the neck, and terminating on the projecting lip of the neck. It is adorned with vine leaves, grapes, and sprays of ivy, all being most beautifully chiselled. It is thought that these cameo decorations were formed by pressing the glass when in a plastic condition into a mould, and that they were finished afterwards by the lapidary's wheel and the engraver's chisel.

Here it will be convenient to mention the work of the Chinese, as, when the art of cameo-glass-making died out in the West, they were still practising it. It is doubtful whether they originated it, or whether they had received it from other countries. The Chinese have been generally considered great copyists rather than originators, and it is not at all an improbable supposition that specimens of the art may have been carried to them from Byzantium. The methods of the modern Chinese would appear to support some such theory. They are said to shorten their labour by simply attaching bits of glass (punched or pressed into the required shape) to the surface

which they desired to decorate. This is done so skilfully that it is very difficult to discern the trickery.

Cameo-glass is made in this way: a tube is dipped in molten glass of the colour which is to form the body of the vase or other object. The lump of glass is then rolled into a convenient shape. Next it is dipped into a cup of plastic glass of the colour of which the decoration is to be formed. If more than one colour is required, this process is repeated. The lump is now heated again, and the different parts become welded together. Then the piece is blown to the form required. When heated and tempered, it is ready for the hand of the decorator. The great difficulty is to get the

different layers of colour of such a disposition that they will expand and contract readily.

The designs are drawn on the vase with a black varnish, of a quality which will not be affected by acids. Then the whole is immersed in acids, which eat away the surface except those parts which the varnish protects. Thus the design is gained in the rough, and is ready for the touch of the engraver, who works with a wheel or minute tools, just as he would carve a gem.

Stourbridge and its neighbourhood are famous for the revival of this ancient art. It has been said that these modern productions are 'entirely pleasing and satisfactory,' although they do not equal the antique in all respects.

GREETIN' HOWE.

PART II.

III.

AFTER a breakfast of sorts, cooked up by old Kellock, Roddy and I lit our pipes and determined, weather or no weather, to explore the celebrated Howe. During breakfast—where I couldn't help being reminded of Caleb Balderstone and Wolf's Crag—we had some more talk with Riggie, who was at least as depressing as on the previous evening. 'Dree yer ain weird, sir,' said he, 'but I tell ye plainly if it was me I wadna bide a day.' 'I'll see it through,' I said, and Roddy asked him why he did not go himself. 'I'll dae my duty,' said he; 'but if ye was ance safely awa', I wudna be lang ahent ye.'

I took a strong liking for Kellock, who had been through so much in these last dreadful days, and still stuck so gamely to his post. Beyond any doubt he believed we were dealing with some sort of devil, for he persisted that Forgan died in the Howe. Having seen Sleat, I can't altogether blame him; that place would beget bogles in the mind of a Chicago drummer. Out on that bleak wilderness of a place, with the sea-fogs rolling all round, one felt cut off from everybody. And the sickening gloom of the house beat all expression. God knows how my Uncle James lived in it—and God knows how he attracted to himself such a stout old boy as Kellock! He didn't deserve him.

Before we could get down to the Howe we had another tedious interview with the police inspector. The police, of course, had been doing their best all along, but the rapidity of these horrors had rattled them more than a bit; to be quite frank, they were making nothing of it. They were convinced that Forgan was being harboured in Knoggan by some of his relatives, and that he was very

much alive; but though they had been through Knoggan backwards and forwards with a small tooth-comb, they never lit on a trace of him. He couldn't be in either Raigie or Aberkeld, and he wasn't in any of the three farms on the peninsula. Then where *was* he? That was just the unpleasant question Roddy and I kept on asking. Knoggan was only a dozen cottages; if he had been there, he must have been found. Moreover, the police theory involved the disbelief of the whole story of the pursuit by Robb and Kellock on that first night, and Forgan's leap into the Howe. My trade is in lies and liars, and I know something about them. If that yarn was a lie, it was an unnecessarily stupid one; and, moreover, Kellock did not strike me as any kind of liar.

We got down to that cheerful place the Greetin' Howe at last, about eleven, in one of the dreariest forenoons I remember. The sea-mist had thickened so that we could hardly see more than a few hundred yards, and it was full of all manner of melancholy noises—the crying of sea-birds, the dismal siren of some befogged vessel, the mournful bleating of sheep. But worse than all there was the greetin' of the Howe itself. The tide was making and about half in, so I suppose we had chosen a particularly good moment from the point of view of effects—I wished we hadn't. Roddy and I had expected that the greetin' would prove like the singing sands and other prodigies—a vague sort of sound that needed all your imagination to convert it into what it was supposed to be. It was anything but that; on the contrary, you wanted to suppress your imagination all you could. I've never heard anything so utterly damnable; the place wailed and sobbed and wept at us like a living creature. My pipe went out from lack of attention, and after a minute or two Roddy

draw me away. 'We'll get the double creeps, old man, if we stay here,' said he, 'and that's just what we *don't* want.'

We wandered back to the house, which leered at us through the fog like some evil yellow beast; my good thrawn ancestor certainly had a unique gift for the ugly. The day dragged on; Roddy had a long cross-examination of Kellock, from which I don't think he gained very much. After lunch the inspector came back, and, partly to get away from him, we strolled over to Pitsadden and had a talk with young Robb. We didn't learn much, but it scotched the police theory so far as I was concerned. That man was neither a liar nor a coward.

As we came away Roddy astonished me by making an offer for three of Robb's oldest and most useless sheep. He got them.

'What on earth——' I asked.

'You know my methods, Watson,' said he, grinning. 'I've been working out an idea. We want data in this show; these sheep are going to give us some.'

Our tempers had worn a trifle thin by evening, and I went off to bed early, *plurima volens*. If the police were wrong and Robb and Kellock were telling the truth, then where *was* Forgan? Dead or alive, where was he? Human or demon, from where was he going to spring upon us? He *would* spring, beyond a doubt—some time, somewhere. I was the last male heir of the house of Sanquhar, and he was bound to have a try for me. I minded the certainty of that less than the altogether detestable vagueness of the rest of the case.

None of the upper-floor rooms in Sleat was habitable, and I had taken a ground-floor room at the back with a French window. It was about ten o'clock at night and quite dark outside, and I put my lamp on a round table in the middle of the room. The door and the French window were both open. It struck me that I could hardly have chosen a worse room, open as this was to attack from two sides. I wandered across to the window with an idea of examining the bolts, and on the way paused idly in front of the dressing-table mirror to look at myself in the vacant way one does. I saw a pretty dismal-looking young man—and then I saw something else. Round the corner of the open door behind me was coming a face.

May God defend me from another such face as that, for it struck me cold in an instant. Its huge eyes glared in madness; its teeth were bared like a beast's; the black hair fell in a swathe across its forehead. I learned in that short minute what murder looks like.

I acted by instinct—for I was horrified beyond the power of reason. I gave some sort of yell, threw myself out at the open window, and went sprawling in a flower-bed four feet below. Gods! it was as well that I did, for

even as I landed among the loose earth I heard a sort of cry like nothing on earth, and in the same moment the dressing-table went over with a smash of glass and splinter of wood. He must have launched himself at me like a lion from half the width of the room. Then the lamp went out, and I heard Roddy shouting and a couple of revolver shots. I slipped round to the front-door and met Roddy in the hall, white as a ghost. 'My God!' he said shakily, 'are you all right?'

'All right,' I said. 'Did you see him?'

'I did.' He shuddered. 'I missed the brute twice. He went out this way. He's gone.'

'Look here,' I said, 'we'll spend the rest of this night together. I'm shaken. I admit it.'

Roddy was recovering. 'I don't blame you,' said he. 'But he won't come back to-night. Unless I'm off the track, he can't.'

'I don't understand you,' I said. 'But I'm taking no risks. We'll double up now and henceforward—and we won't have Kellock far away either.'

We moved a bed into Roddy's room—I didn't care somehow for mine—and we made a pretence of dosing down. But I don't think either of us slept much. And so the morning and the evening were the first day.

IV.

Next morning Roddy began his experiments with the sheep. He chose the hour when the tide was backing and about a third ebb, and drove one of his sheep into the Greetin' Howe loch. The brute struggled for a moment or two, then was drawn into the whirl, and went down like a stone. In the clear water we could see it vanish through the hole in the bottom. An hour later he put down a second sheep, and the same thing happened. After lunch he led me along the cliffs, and there, in the eddy where the tunnel from the loch was supposed to end, were two dead sheep floating.

I asked him what he was up to.

'Data, my lad,' said he, 'data! Our information about this singular phenomenon is defective. It needn't be. That's where the police have slipped up. They've started making theories, instead of first collecting all possible data.'

'You might explain,' said I rather peevishly. 'I've enough on my hands without playing Watson to your Holmes.'

'Well, my dear Watson,' he said, 'it's like this. As old Sherlock Holmes remarks, when you have eliminated impossibles the residuum of possibles must contain the true solution. Now, I'm a medical man. As such, I don't say risings from the dead are impossible, but I do say that it's impossible to rise from the dead in a sufficiently corporeal form to leave foot-prints and smash over heavy dressing-tables. Agreed?'

'Of course,' I said.

'So are the police so far. Now they go wrong. They won't admit Kellock and Robb's story of Forgan's going into the loch. Why? Because if he did he would be dead, and he isn't dead. Q.E.D. Well, just there comes in the unjustifiable assumption. Suppose both these things possible. Suppose he did go into the Howe and still isn't dead. Why not?'

'Because no one,' I said, 'has ever gone "doon the Howe" and lived.'

'Only five people have ever gone down,' said he. 'I've worked that all up, and I know all about it. Two were old men, one was a child, one was certainly drunk, and the other probably. You couldn't expect them to do much else but die. Now, no one's ever gone down the place in daylight at low water and explored it.'

'There you're wrong,' I said. 'Geordie Gow did it ten years ago for a pound note and a bottle of whisky.'

He shook his head at me provokingly.

'Geordie Gow said he did, and the witnesses saw him go into the hole; but I'll bet he never went more than a yard beyond the entrance—just out of their sight and no more.'

'You'll have to prove that,' I said.

'I will,' he replied, 'in good time. We've heard a lot about Geordie Gow these last few hours, and it's all this trust in Geordie Gow that's spoilt the scent. Rule him out meantime.'

He sat down on a knoll, and set to work to fill his pipe. I was beginning to get interested.

'Get it into your head,' said he, 'that a man can go "doon the Howe" and still live. Get it into your head that Forgan *did* do it. What does that mean? It means simply that there's a crack, or cave, or side-track somewhere in the thing that's above high-water level. It's far from impossible—indeed, it's likely. Forgan, hard pressed that first night, went into the loch, thinking, no doubt, it was all over. Instead, he struck this side-crack or cave. Supposing this to have happened, what better place could he possibly have found for his purpose? Supposing he could raise a bite of food sometimes in Knoggan—I'll bet the police are right there, and that's what he's doing—he couldn't possibly have a better howf. In fact, I'm willing to bet that he's down there now.'

I said something sceptical; indeed, the whole thing seemed to me very far-fetched.

'Well, look at it this way,' said he. 'As Kellock says, "If he's no' doon the Howe, whaur is he?" This countryside's as bare as a board; there isn't cover for a sheep, apart from human buildings. There are no caves on the coast. The number of human buildings can be counted. The number in which he could possibly be can be counted on the fingers of one hand. They're all in Knoggan. He certainly isn't there. Then where is he? Down the Howe, and that's all about it.'

I said nothing; but I was interested, and told him to go on.

'You know how they prove the nebular theory,' said he. 'It isn't done by direct proof, but by a series of congruities that could hardly be mere coincidence. Orbital motions and angles, and so on. Well, I've got a couple of congruities here that are pretty good for my theory.'

'As, for example?' I said.

'As, for example, this. Dead men have dead bodies. Forgan hadn't. I've been at pains to look up the record of every soul who went down the Howe; every one of them came up smiling in a few hours in the sea outside. You saw what happened to these sheep just now. I'll put the third sheep down to-morrow, and you'll see the same thing again.' (In parenthesis, let me say here that this is what happened.) 'What's the inference? That if any living creature is drowned in the Howe its body reappears in the course of time in the sea outside. Forgan's body never reappeared. What's the inference? He wasn't drowned. He went in and he never came out, therefore he's there still.'

'You're getting a bit muddled,' I told him. 'You're only proving now that Forgan isn't dead, which is surely admitted.'

'Not by Kellock and Co.,' said he. 'But patience; that's only half. That single congruity has its value as showing he might be in the Howe. Anyway, here's another and a better one that shows he is there.'

'People who are out for murder generally choose the middle of the night for obvious reasons. Now, your Uncle Robert was done in about five in the morning—a precious silly time to choose. Your cousin was finished off in the early evening when they were expecting him at dinner—a sillier time still. The attempt on yourself was made at 9.50 p.m., a time when reasonable beings would be having a pipe and a drink in the billiard-room, and not thinking of going to bed for hours. Nobody would choose such times. What's the inference? Forgan didn't choose them; he had to take them, or do without. That's what I meant when I told you he couldn't come back last night for another cut at us, though time must be precious to him. And he didn't, did he?'

He laid a hand on my arm and fished a piece of paper from his waistcoat pocket.

'Read that,' said he, his eyes shining with triumph, 'and if that doesn't convince you, I go back to Auld Reekie.'

On the paper he had written in parallel columns the hours of the two murders and the attempt on myself, with the hours of low water. The series coincided to within forty minutes or three-quarters of an hour at most.

Chambers's Journal

SEVENTH SERIES

'FACILIS DESCENSUS.'

By JOHN EYTON.

PART I.

I.

'GOOD-BYE! Good-bye! And, thank God, for ever!'

Thus William Anstruther Parkes, C.I.E., I.C.S., as he chucked his solar topee out of the porthole into the sea. With a foot on the bunk he watched it spin round and round on the oily green water, watched the sea-gull dash at it, mistaking it for a loaf of bread, watched it disappear. But he did not wait to see Bombay sink also into the sea. India, in epitome, had sunk in his hat.

He had pictured this moment for precisely twenty-one years—ever since the first hot weather had boiled the original griffin's glamour out of him, and at the same time had shown him India, stripped and withered and sun-dried.

Being a methodical man, he had, at that dim period, started a diary of landmarks, and on the title-page had inscribed the tale of the years which he was doomed to spend in that meretricious land. On every subsequent 1st of May he had run a line of red ink through the past year with a slash of a quill pen, and celebrated the event with a bottle of champagne at dinner. Now there were twenty-one slashes, like knife-wounds, down the page, and no more years to slash. The exile was over, and he was going home.

He belonged to a type—the ordinary, humdrum Indian civilian who bears the burden and heat of the day, in fact, the district officer. Having neither brilliance nor facility, nor small-talk, nor push—the secretariat requisites—he had been branded from the first for his mission in life, which, broadly speaking, had been to govern, control, judge, punish, assess, educate, disinfect, and sometimes hang the hundred thousand human beings who chanced to exist within his jurisdiction. He had come to know the characteristics of those human beings rather well, since, in his twenty-one years of service, he had done every possible thing for them short of bringing them into the world and burying them when they left it. They had failed him often. Like children they had sometimes seemed to entertain an affection for him, refer-

ring to him repeatedly as 'their father and their mother,' but, like children, had seemed to forget him so soon as his back had been turned. Possibly he still cherished a sneaking regard for them, and possibly, too, the measure of this regard was the measure of the pleasure he had had out of India, but at this epoch-making moment of life he resolutely shut his eyes both to the regard and to the pleasure. He had done with India, and—thank God!

He was at heart, perhaps, a pessimist, for his vision of the brightness and colour of the East had always been impaired through a fatal faculty of seeing what was not there with greater distinctness than what was there. Thus, when pictures of the East could be had for the mere effort of looking, his mind had seethed with pictures of the West. Riding through the broad plains—rich, in their way, with their grain and rice and poppies and sugar-cane—he had found himself hankering for English hedges to shut off and determine the wealth. In the unequalled Himalayas he had sighed for gorse and heather, in the jungle for bracken, on the roads for wild roses and picturesque turnings, in the cities for electric light and good concerts.

But he would stoutly have denied the soft impeachment, for his attitude to England was one of bounding optimism. In England he was ready, as he put it, to put up with anything. He had never had time to drink deep of England, his infrequent furloughs having been the merest sips at that most tantalising draught. But now he meant to drain the cup. As he sat on the bunk in his cabin, heedless of the sinking of Bombay into the sea, he made himself promises. Every dream that he had dreamed in the hot and jaded hours he would now realise. First, he would buy a car, and look round for a house with a few fields and a bit of shooting, as distant as possible from the conventional Anglo-Indian paradises. Then, a month or two in town for theatres and concerts; a tour in the Lakes; a fishing trip to Ireland; and again—home. Never again that bazaar smell, compounded of mankind and refuse and dust and over-ripe fruit, all gently simmering

in that everlasting glare; but sunlight veiled in clouds, and the smell of wet leaves, and the purest air under heaven. Ten, twenty years of it, and then, at last, some shady corner where grass grew green and moss crept over the gray stones. England! England! . . .

He had always intended to throw his hat into the sea. He *had* thrown his hat into the sea. Now the exuberance of the moment seemed to demand that the diary of landmarks should share the watery burial. Unburied, it would recall too much.

He took it out of his suit-case, and turned over the leaves on which he had noted the principal facts of his life—transfers and stations; increments in pay; important cases tried; pats on the back and slaps on the face from Government; leaves; birthdays and deaths of friends; his C.I.E. awarded after a spell of famine duty. How indescribably petty it all was! What would the sum of it all convey to the man in the street at home—to the average person one met?

He recalled the remarks of a lady whom he had once taken in to dinner on an occasion during his last furlough: 'So you come from India—how very interesting. A deputy commissioner—how *very* interesting; how you must miss your curry and rice!'

Curry and rice! Twenty-one years' exile, and—curry and rice! To the man in the street he conveyed just that.

With a laugh he sent the diary to join the hat. On the way through the porthole one paper parted from it, and fluttered as if undecided whether to go or stay, alighting finally on the bunk. He picked it up and looked at it. It was a snapshot of one of his earliest shooting-parties. It was faded and difficult to straighten out, but his own face was still fairly clear. Impelled by a sudden whimsical desire to see what time had done with him, he looked in the cabin mirror.

Bald, thanks to the topee; grey, thanks to the sun; yellow tinge, malaria; wrinkles, hot weather and sleeplessness; poor teeth, the food. That was all—a big account, though.

But his eyes, his features, were the same now. He had not run to fat. He could still walk. He could still laugh. He could still live!

With an almost boyish bowling gesture he despatched the snapshot, rolled into a small ball, to join the other two relics below.

II.

So William Anstruther Parkes started a new diary. There were no figures on its title-page awaiting the red slash. He had no cause to wound the innocent years of retirement. Yet the habit of writing something on the title-page for guidance was strong in him, and he wrote three resolutions—or rather warnings—of a personal character.

'Nothing will persuade me to join the Bando-bast Club,' was the first.

'Nothing will persuade me to marry,' was the second.

'Nothing will persuade me to return to India,' was the third.

These were the three fates which he abhorred most, yet he had scented no temptation in them at all; their inscription in so prominent a place was practically otiose. It was almost as if he had to remind himself of his aversions—almost as if he were afraid. He was quite clear as to the logical basis of these three abstinences. The Bando-bast Club represented a weak impulse to coquet with the past. To join it, therefore, would be to play with fire. Marriage had, in addition to its own peculiar perils, this same element of danger; for he could only marry either a lady who had been to India, or a lady who had not been to India. The former would talk incessantly about India, while the latter would yearn incessantly to visit it. In marriage he could by no means escape India; and as for returning there, it would be sheer abysmal surrender to the powers of evil. His return would be India's victory. It would lead to his being buried there—the fate which, of all, he had determined should not be his. The mere fate always called up a dismal picture of a shadeless cemetery on the outskirts of a cantonment, with bleached grass and withered flowers, and the pall of the hot weather over all; of a few officials attending under orders, and a few clerks attending for the purpose of impressing the officials; of a servant snivelling in the background—the only sincere mourner; and of the hot sun beating down for ever and ever when the funeral was over. Of all things, not that! A damnable fate!

Thus, the negative items of this programme. The positive items he had no need to record in writing. They had been evolved in twenty-one years of dreaming. They were intentions. They were certainties. And he was singularly successful in putting them into practice; so successful that, after two years, he was in a position to say what very few men can say, that all his dreams had been realised. It almost seemed as if the moment of vision in the P. & O. cabin had been truly as epoch-making as it had seemed to be. For he had bought a car. He had not only looked round for a house, but he had obtained a ten years' lease of one, with option of renewal. He had a few fields and a farm to shoot over, and he was a day's journey from Cheltenham and Camberley. Furthermore, he had put in a month or two in town, had toured the Lakes, had fished in Ireland, and had, on his return from these jaunts, appreciated fully the welcome of home.

His dreams were exhausted. That perhaps was the mischief of it. True, he could always improve the garden; and for wet days he

promised himself a little amateur carpentering, varied by an occasional rubber with Firkins the parson, Plintock the doctor, and Ling his landlord. But, even as he formulated these intentions, he was aware that they lacked the essential *joie de vivre* that had characterised the old dreams. There was something lacking.

He thought he had hit on it—work. So he accepted an invitation to become parish councillor and churchwarden. He entered into the life of Pilchester, where he had made his home. He opened the 'Gables' for the annual rummage sale; he became a vice-president of the Pilchester cricket club; he judged at the flower-show. Where in the past a hundred thousand men had entitled him their father and their mother, perhaps fifty now conceded him a mildly

avuncular relationship. But he consecrated himself to Pilchester. He had every intention of living out his days in Pilchester, of dying in Pilchester, and of being buried in Pilchester. He had even earmarked a plot of ground for the purpose.

Work—work of a public nature—seemed to fill any gap that might exist in the programme of the future, the future which, like a great plain, stretched ahead, serene and undisturbed. Looking down on that plain, as it were, from the height of achieved desire, he saw no hint of India in it—no flash of colour or glint of a gilded dome to tempt him back. At that period above all he regarded himself as impervious.

(Continued on page 61.)

THE ROMANCE OF A MYSTERY METAL

By FREDERICK A. TALBOT, Author of *Treasures of the Earth, Inventions and Discoveries, &c.*

I.

THE halo of romance, in varying degree, invests every metal which has become established in the world of commerce and industry. The more difficult the effort to recover the metal, the more intense the atmosphere of wonder and fascination in which it is enveloped. At the present moment science is striving desperately to probe many mysteries in this realm. In many instances success has been achieved, but only in the laboratory, and the translation of such experimental methods into commercial processes is proving tantalisingly elusive.

The miners of the early days were confronted with exactly the self-same problems, but to a more acute degree, owing to lack of knowledge and the indifferent progress recorded by science. These diligent prospectors had a summary manner of classifying those ores which, upon submission to the usually honoured reduction methods, steadfastly refused to reveal their metallic secrets. They were termed 'kobold' (or 'goblin') ores, and from the early miners' point of view the description was apt. Yet, although the word was employed in its very broadest sense, and as applying to all such obstinate ores, it has come to be recognised as the generic name for one of the elements—namely, cobalt.

The reason for this application of a broad collective term to an individual treasure of the earth is obscure, although an obvious explanation is forthcoming. In the dim distant past some more than usually inquisitive worker discovered that the ore in question, upon submission to a specific treatment, rendered a beautiful rich blue pigment. When he displayed his achievement before his friends he

probably explained its origin, and, accordingly, for purposes of distinction, it became known as goblin blue, signifying the blue prepared from the goblin ore, which in course of time became standardised in the commercial sense, and to this day is known as cobalt-blue.

Further investigation by these early workers revealed the circumstance that this goblin blue was unrivalled for the colouring of glass and porcelain, and so this became its recognised field of application. The beautiful bluish tones of Bohemian and Venetian glass, so highly prized by collectors, are due to the utilisation of this material, and to this day it remains unequalled in this respect. Only the most minute quantity of cobalt is required to endow white crystal-glass with a bluish tinge. It has been found that a proportion of one part of cobalt to twenty-thousand parts of other materials will suffice to impart a slight delicate blue tone to the resultant product. Obviously, in view of this fact, enormous scope is extended to the craftsman to produce a riot of effects with a single colour.

The first employment of cobalt in this capacity is lost in the depths of time. The ancients practised it freely, but they guarded their secrets well, and, in course of time, it became numbered among the processes that were. About 1540, however, the secret was probed. A diligent and observant glass-maker of Nuremberg was tempted to ascertain whether kobold, as it was called, was invested with any colouring property such as is associated with other ores. He melted a small quantity, mixed it with his ingredients for the production of glass, and was astonished by the beautiful rich blue coloured glass which he obtained.

The Nuremberg glass-maker's success aroused widespread interest, and created for him a distinctive reputation. When his rivals, by dint

of persistent cautious investigation, discovered the secret of imparting the delicate blue tint to the glass, they, too, were induced to embark upon the preparation of the tinctorial agent from this ore, which became known as 'smalt.' From Germany the new industry spread to Holland, where the commodity was prepared for the Irish linen trade, which drew the whole of its supplies from the land of dykes and wind-mills, while the Dutch also used it for the preparation of litmus papers. The Venetian glass-makers apparently did not venture into the field of smalt production, but were content to purchase their requirements from the 'smalters' of Germany, the price being about eightpence per pound for smalt carrying approximately 6 per cent. of cobalt.

The industry may be described as being of a flourishing character for those days. There were about twenty-five firms specialising in the production of the material, but their aggregate output was small. It did not exceed three hundred tons a year. The supplies of the necessary ore were drawn from a German deposit discovered towards the end of the fifteenth century, and the demand was so pronounced, and the industry so prosperous, that the firms specialising in the manufacture of smalt could afford to work ores which carried only about 3 per cent. of the element.

II.

The preparation of the smalt is somewhat protracted, though the operation may be described as straightforward. Cobalt suffers from one serious disability—it is always found in company with other elements, such as sulphur, arsenic, iron, copper, nickel, and manganese. The European and Canadian ores are deficient in manganese; those drawn from the Antipodes carry manganese, but neither arsenic nor sulphur. These associated elements must be eliminated, inasmuch as they adversely affect the intensity and the purity of the blue pigment. Indeed, the maintenance of the uniformity of intensity always constituted the supreme obstacle confronting the smalt-makers.

The cobalt ore was crushed, sorted, and washed, the resultant 'schlich,' as it was called, then being roasted to drive off the arsenic, which, being a marketable commodity, was collected. By submission to the roasting treatment the element also became converted into the oxide of cobalt, which was what was required. The roasted product was ground to a fine powder and passed through the silk sieve, when it was called 'zaffer.'

The zaffer was then mixed with crushed quartz and potassium carbonate and the mixture placed in a kiln, which brought about the fusion of the ingredients. The molten materials were drawn off and cooled, and the solid mass again pulverised, slight impurities being removed by

washing. After the powder had been dried it was again heated, the result of this second heat-treatment being the passing of the cobalt into the slag. The nickel which was present combined with the remaining arsenic to form a sediment or matte at the bottom of the crucible, while the iron became oxidised. The sediment or matte was carefully withdrawn, while the remaining slag or blue glass carrying the cobalt was also removed. This slag was then poured into water to cool and solidify, when it was dried and ground to dust, to be subsequently mixed with water and set aside to stand for a short while. Rest brought about the precipitation of the coarser particles to the bottom of the vessel, while the water was turbid with the finest dust. This solution was poured into a second vessel, and set aside for many hours to allow the pigment proper to settle. A third decanting operation was then made, the vessel being permitted to stand for a day and a night, which allowed all the particles in suspension to precipitate, leaving a clear solution. The water was carefully drained away, and the sediment dried, to resolve itself into a fine pale glass powder. Further washing took place, the purpose being to secure as pure a smalt as possible.

From what has been related it will be seen that several days were occupied in the preparation of the finest grade of cobalt-blue, but the purer and finer the ultimate product the higher the price commanded. The smalt was marketed under a variety of classifications, the grading of the product being in accordance with the intensity of the colour and the proportion of cobalt present. The practice was to indicate each grade with a distinctive letter, to enable the glass-maker to obtain just the shade of colouring which he desired for his particular line of production, but each was also given a distinctive name, such as azure-blue, cobalt-blue, Saxon-blue, and enamel-blue, to mention only a few of the names under which commercial transactions were conducted.

As perhaps may be imagined, the employment of cobalt for the colouring of pottery has been known for centuries to the Chinese. It has been extensively employed for the tinting of the glassware coming from the famous works of Canton. The tinctorial material in question is known as *lam-o-li-shek*, or 'stone for blue glass.' The methods are peculiarly Chinese, and, in accordance with Chinese traditions, amazingly successful, if we bear in mind the primitive nature of the plant employed. The furnace is exceedingly crude, while the blowpipe is of a similar character; but, notwithstanding these apparent deficiencies, the workers are wonderfully skilled in working the poorest of ores, and obtaining a colouring matter of striking purity. The crucible is in keeping with the furnace, being fashioned from clay and dust.

By the aid of the furnace the impurities are

apparently precipitated, and it is the upper part of the melt which is retained. This is subsequently ground to a fine powder for the preparation of the pigment. When the painting of porcelain is proposed the material is fritted with other materials, the whole being reduced to a fine powder. The burnt biscuit is covered with a glaze upon which the design is painted, and in this manner both enamel and colour are burned in a single operation.

III.

The manufacture of smalt continued to be a more or less successful industry, even after the discovery of the extensive deposits of cobalt in the French Antipodean dependency of New Caledonia, which in due course became the world's staple source of supply, about 85 per cent. of the total consumption of this goblin ore being derived from this source. New South Wales, where the mineral is also to be found, became the second most important contributory country. The demand was fairly consistent, and the price for the oxide ruled fairly steady, ten shillings per pound being the average market figure.

In 1908 there came a sudden collapse of the market. In that year Canada appeared upon the scene as a cobalt oxide producer. This was not surprising. Five years before the wonderful cobalt-bearing country in the vicinity of Lake Temiskaming, on the border of Ontario, had been revealed to the world; but it was not the cobalt which attracted so much attention in the first instance as the silver. In this case the goblin ore was found in association with the argentiferous metal, and to such a degree as to render it more profitable to exploit the silver than the cobalt. Such a result was scarcely remarkable, seeing that silver was in far greater demand than its consort, the world's annual consumption of cobalt at that time being a very limited quantity. Furthermore, the silver was so abundant, the ore averaging two thousand ounces per ton, that the cobalt could be ignored. In due course, however, as the richer silver ores underwent exhaustion, the feasibility of recovering some of the other metals associated therewith began to attract attention, and, in order to develop the cobalt industry, the Canadian Government offered a bounty which invested the less familiar metal with enhanced importance.

But the recovery of the cobalt proved to be no easy matter, especially as, in the first instance, the ore had to be despatched to the United States to be smelted, owing to the absence of such facilities in the Dominion. The American interests were solely concerned with the silver content; the cobalt and other elements present were ignored and wasted. But the introduction of the bounty system favoured the domestic recovery of the cobalt in the form of the oxide, and, within a short time, the smelters found

themselves possessed of large stocks of cobalt oxide of which they were anxious to dispose.

A determined attack upon the European market, the main centre of consumption, was made. All anticipations of an easy conquest being effected were promptly dispelled. The manufacture of smalt was a close and jealously guarded industry in Europe. The manufacturers were known to their clients, and the grades of their colouring materials commanded unswerving confidence. The maker knew what the ceramic industry demanded, and spared no effort to meet the requests. The Canadian competitors could hope to meet with success only by excelling the European producers, both in quality of product and in cheapness. So far as the last-named factor was concerned, they were also pitted against the New Caledonian interests, which had likewise secured a firm grip upon the market.

To achieve their end, the Canadian producers of the oxide forced the price down to three shillings per pound. At this figure the New Caledonian interests could not aspire to hold their own, and, rather than continue working at a loss, they dropped out of the running. Since 1909 the New Caledonian product has practically been unknown, though it is believed that, with the hardening of the price for the oxide, this contributory source will again have to be reckoned with. But even cutting the prices failed to bring the victory anticipated. It was not until the European dealers resorted to the practice of packing the Ontario cobalt in the packages which had formerly been used for the European smalt, and marking them with their old labels, so as to induce their purchasers to believe that they were receiving the article to which they had been accustomed for so many decades, even centuries, that any headway could be made. The pottery manufacturers, in their ignorance, used the Ontario oxide, and were agreeably surprised to find that the European product, as they believed it to be, had been so strikingly improved. Of course, when they learned, in due course, that what they imagined to be European smalt was really Canadian oxide, they demanded the latter. The result was the gradual abandonment of the manufacture of smalt, which has not been practised now for over a dozen years. It has become numbered among the lost industries.

Canadian cobalt dominates the ceramic industry of the world to-day, a result due, in the main, to the persistence and diligence with which the Ontario Government has emphasised its virtues and value. The technology of the mineral, which was practically virgin ground, has been pursued energetically by the Department of Mines and the School of Mines of Kingston, Ontario, the fruitful results of which induced German chemists to embrace the self-same line of research. But it is Canadian

enterprise and initiative which has been responsible for the world-wide appreciation of the goblin ore to-day; and it may be remarked that the technological side of the issue is being attacked more energetically than ever by the interests concerned, to the advantage of the industry as a whole. While research has not been responsible for the evolution of any revolutionary methods for the recovery of the mineral, it has succeeded in bringing the centuries-old processes in line with contemporary thought, and has rendered them strikingly efficient.

IV.

As a colouring medium cobalt cannot be excelled, although its uses are no longer confined to the provision of the blues. Technological investigation has revealed the fact that, in combination with other chemical compounds, a variety of tinctorial effects can be produced. Strange though it may seem, it is employed in the preparation of the very finest of white enamels. In its raw form—that is, as the straight oxide—it is gray or black in colour, but when fused with borax or sand it assumes a brilliant blue character. When a small quantity of the latter is added to a white enamel, the natural blue tone completely neutralises the yellowish tinge attributable to iron oxide, due to the blue being complementary to the yellow. On the other hand, in a compound form, it will render the blackest of black enamels intensely rich in tone. By introducing other compounds, delicate and rich greens, bronze, yellow, and brown can be secured, while recently pink and red colours have been obtained in the laboratory. The tinctorial resolution of cobalt is only in its infancy; experiment in this field offers illimitable scope to the chemist.

Yet, while cobalt commands the ceramic and enamelling industries, it would appear as if these are destined to represent its minor applications. The early miner found it impossible to reduce the element to its mineral form from the ore. But Brandt, in 1733, proved that it is by no means the goblin ore of tradition. He succeeded in obtaining the element in its metallic form. This achievement, however, was regarded as being a mere laboratory conquest. The mineral is never found in its native state, and this circumstance is the only one which weighed with the miner. Nevertheless, the circumstance that one worker had succeeded in extracting the metal from its ore has stimulated a new line of investigation—the production of the element in the metallic form. For some time the perfection of a practical process appeared hopeless, owing to the affinity of cobalt for other metals, a tendency which was reciprocated by the elements concerned. The difficulty was to tear it away from its companions. This task has now been stabilised by resort to chemical treatment and the electric furnace.

Metallic cobalt extracted from the ore, when polished, assumes a bright, silvery lustre. On the other hand, when reduced from the oxide it is a grayish powder. Both forms are commercially useful, as experiment has conclusively proved. The attempt to secure the metal was stimulated by the desire to ascertain its effect upon other metals. Nickel has entered into the composition of alloys for some time past, and as cobalt is so closely allied to nickel from the chemical point of view, it was concluded that it would exercise a broadly similar effect. But when, after securing the metal, experiments in this direction were undertaken, some decidedly startling results were observed.

The addition of cobalt to steel was one of the first developments, and the British metallurgical chemist who made the initial experiments in this direction found that such addition imparted greater elasticity and tensile strength to the steel. From constructional to tool steel was a logical step, especially in view of the demand for improvements in this field, although owing to cobalt being so closely allied to nickel, which had proved unsuitable, but little success was anticipated. But, although cobalt and nickel may be very similar in many respects, they were found to behave very differently when brought into intimate relationship with steel. Nickel enhances the toughness of the steel but not its hardness. On the other hand, cobalt increases the factor of hardness. Consequently, whereas the addition of nickel to tool steel gives a soft cutting edge, the introduction of the cobalt gives a harder and more durable cutting edge, enabling far higher cutting speeds to be attained and maintained.

This discovery undoubtedly would have resulted in cobalt being in heavy demand for the production of tool steel but for another far-reaching development. A patient investigator was labouring in another direction. This was the perfection of a new alloy, to which he applied the distinctive name of 'stellite.' Despite the suggestion extended by the name, steel does not enter into the composition of this alloy, which is a combination of cobalt, chromium, and tungsten, while its properties are altogether different from those of steel. The name was suggested by the circumstance that the alloy assumes a bright polish which is not only resistant to oxidation when exposed to the atmosphere, but which is not readily affected by the ordinary acids. The colour of the polish is also somewhat distinctive, lying between that of steel and of silver.

The salient characteristic of stellite is that it cannot be hardened or tempered. Furthermore, the cutting edge does not deteriorate even when raised to a red heat. Finally, a cutting tool fashioned from the combination in specific proportions of these three metals allows a far higher cutting speed to be attained than is

possible with high-speed steel or even high-speed cobalt steel. Even when the alloy is restricted to an admixture of cobalt and chromium an exceptionally hard metal is secured. But this virtue is improved very materially by the addition of the tungsten or of molybdenum, though the latter has to be added in lesser quantities. The degree of hardness is varied by the proportion of tungsten added, although it is not practicable to advance too far in this direction, because as the hardness is increased, so is the brittleness of the metal.

In view of the fact that cobalt-tungsten-chromium alloys cannot be forged, tools fashioned thereof have to be made along special lines. Casting has to be favoured, the bars being of the designed shape and size, and the cutting edge bestowed by grinding on a carborundum wheel. The circumstance that the degree of hardness can be varied by ringing the changes on the proportions of the ingredients has rendered it possible to fashion special stellite tools for different classes of work. Thus the stellite intended for woodworking tools carries a relatively low proportion of tungsten. Another grade of greater hardness, but less strength, is employed for turning cast-iron, while a third grade is used for working steel. The tool contrived for turning steel cannot be used for a similar purpose in connection with cast-iron, because the edge suffers rapid destruction.

The peculiar virtues of stellite have suggested its use for the manufacture of cutlery. Resistance to oxidation and corrosion by acids renders it an excellent stainless metal for this purpose, while the fact that the edge once imparted can be retained for a long time is an additional recommendation for such duty. No developments in this direction have yet been recorded, despite the attractions extended, for the simple reason that the demand for stellite for tool purposes is far in advance of supply.

V.

In so far as cobalt alloys are concerned enormous scope is offered for further experiment and research. Much has been accomplished in this field, but definite conclusions have not yet been recorded in connection with the familiar metals of commerce. The Germans have been particularly aggressive in this field of research, and have accomplished much valuable work of a basic character, which should lead to further developments of far-reaching significance, especially in view of the many surprises which appear to be sprung as the result of the introduction of cobalt, either alone or in company with other metallic elements.

It would appear also as if cobalt will seriously dispute with nickel recognition in the electroplating industry. Cobalt-plating is already carried out upon a limited scale, and is proving attractive from every point of view. Less time

is occupied in the process, while there is a reduction in the quantity of material required to achieve a specific protective purpose. The resultant plating is also said to be harder than that of nickel, and of a pleasing rich bluish tinge.

Our knowledge of cobalt and its commercial possibilities is conceded to be decidedly imperfect. Cobalt is indeed a mystery metal; but bearing in mind that the element in its metallic form has occupied the serious attention of the chemist for only a dozen years or so, the progress recorded is certainly of a decided and momentous character. It must also be remembered that research is essentially pioneering, and it is this characteristic which invests the chemical quests with such fascination.

The circumstance that cobalt is destined to play a much more prominent rôle as the handmaid of metallurgy than as the servant of the ceramic industry is obvious from the increased output of the element in the metallic form, and the steady price ruling therefor. Its absorption as a tinctorial agent is severely limited and approximately established, but in so far as the metallurgical trades are concerned the persistently widening demand is leading to an increased output of the metal, while the price is tending upwards. During a recent year the shipment of oxide from Canada was about 400,000 pounds, but that of the metal 300,000 pounds, while more than 80,000 pounds was absorbed in the manufacture of stellite. The average price in recent years for the oxide may be set down at about six shillings per pound, that for the metal from ten shillings upwards per pound. Canada will remain the foremost centre of supply for many decades to come. The silver cannot be won without the release of a certain quantity of cobalt, and, consequently, so long as silver continues to be mined cobalt must be produced. Furthermore, there are immense supplies of tailings, carrying from four to six ounces of silver, from which no cobalt has been recovered. These stocks are estimated to be in excess of 2,500,000 tons, and as cobalt metal has now established a firm market, it is becoming profitable to treat these tailings, the silver being regarded somewhat in the light of a by-product.

CUPBOARDS.

CUPBOARDS are mysterious places,

With lock'd silent doors;
Biscuit tins and wooden cases
Hold all sorts of stores.

China cups and plates are standing
Neatly in a row;

In a cupboard on the landing

Pegs where greatcoats go.

Into one I dare not peep,

Down the kitchen stairs,

'Cos once cook said some people keep

A skeleton in theirs.

That is such a gloomy spot,

It may be there as likely's not.

ANNE MACDONALD.

A GIPSY OF THE NORTH.

CHAPTER III.—BETWEEN TWO FIRES.

AS he walked down the soft bed of the stream, Carwyke's greatest fear was that the man Bull, keeping watch on the tundra, might have observed his flight and have crept towards the beach to intercept him. Accordingly, having set some distance between himself and the camp, he made a halt, and, leaving the water, crouched on the bank to reconnoitre.

It was now verging on midnight; the disc of the sun was below the horizon, yet the sky glowed rosily, and everything on the tundra stood clear in view. Looking backward, he saw the ridge of the white tent that he had left, but the two men on the farther side of it were not visible. Across the wide stretch of moss he saw the tops of the Eskimo tepees, but between them and himself he could see nothing that moved. His eyes searched the waste of moss carefully without discerning anything suspicious; then a low-flying bird appeared (as it seemed) from nowhere, and as it reached the crest of the undulation, less than five hundred yards from where he crouched, it swerved sharply. Instantly his eyes fixed themselves upon that rise in the ground, and picked out the recumbent form of a man. He smiled to himself. Bull was not likely to trouble him; in all probability he was dozing. In any case it was clear that as yet he had not observed anything suspicious.

He resumed his way, and presently arrived at the mouth of the stream. The tide was out, and rather than expose himself on the promontory he walked round it, wasting time, but playing for safety. Unmolested he had almost reached the spit from which he had first seen the white girl, when a sudden hail broke the stillness.

'Car-r-wyke!'

He glanced hastily round. Standing on the low finger of land behind him were two men, whom he instantly recognised as Standifer and Mardock. They had discovered his flight, and no doubt suspected his intention. Without replying to their hail he hurried on, and was mounting the spit where he had crouched under the Eskimo fire, when a second bawling hail reached him.

'Car-r-wyke! Come back, you fool!'

This time he did not even look round, but as he reached the boulder where he had previously lain he crouched instinctively, and in the same second heard a couple of bullets sing over him. The crang of the rifles disturbed a flock of seabirds, sending them wheeling and screaming in the air; and as he scrambled down the low-lying spit the rifles spoke again. That the sound of them reached the Eskimo camp he had ample evidence, for a moment later a solitary rifle replied. Whether the fire was directed against

himself or his pursuers he could not determine. The bullet had seemed to be travelling high, but he was not sure, and now, as he had anticipated, he was between two fires; and being in all probability the only visible target, he was in a situation of considerable peril. Concealment naturally suggested itself to him, and he turned impulsively towards a boulder. Then a second thought altered his course again. If he sought shelter the action was likely to be misunderstood by the Eskimo marksman, and he would inevitably become the target.

He thrust his hand up above his head, and marched on, trusting the natives in the encampment would understand that he sought peace and not war. For a full minute nothing happened, but not for a moment did he dream that Standifer and his companion had ceased their hostile activities. As he knew, the spit of land behind him momentarily hid him from view; in a very little while he would be in the range of their vision again. The small beach along which he trudged afforded singularly little cover, and as once again the rifles behind him cracked, a cold *aura* passed through his blood, and he felt his hair creep. One of the bullets plugged the sand in front of him, sending a little spurt of it in the air, whilst the other sang well over his head.

Instantly from the camp ahead three rifles answered, and from the sound of the missiles he knew that they were not aimed at himself but at the men who were pursuing him. His heart leaped at the thought that the natives understood that his intentions were friendly, and he tried to make a spurt, whilst other shots broke the quiet of the rosy midnight.

The camp was very near now. He could see the yellow flame of the fires as they cracked, and could discern the forms of men lying on the moss. Sweating and gasping with his exertions he suddenly slipped, and as he stumbled forward the weight of his pack sent him sprawling in the muddy sand. He heard a distant shout as of triumph, a howl from the Eskimos in front, and before he could pick himself up two of the fur-clad natives bounded towards him. The fall had knocked out of him what little breath he had, and as the men picked him up he was gasping painfully.

'Him shot?' asked one of the Eskimos stolidly.

Carwyke shook his head, having no breath for speech, and the natives hurried him forward. Soon he was standing in the shelter of the tepees, with a score of the flat-faced, dark-eyed, and lank-haired aborigines about him. One of them swiftly unslung the rifle from his shoulders;

ed to show his friendly intentions Carwyke hastily handed another his knife. He looked round for any sign of the white girl for whom he had faced death.

He found none. At the tent doors he caught sight of dark-eyed children peering at him with the curiosity of childhood the wide world over, their stout and comely mothers behind them. One or two old men were lying on the moss, as depressed, to avoid the flying bullets whilst they witnessed the fight; and on the outskirts of the camp, prone upon the tundra, there were younger men with harpoons and fish-spears in their hands, as if in anticipation of a rush. But nowhere could he see anything of the one person whose death he had hoped to find.

As his breath came back he was conscious of a disappointment; and as he looked at the Eskimos babbling excitedly, and eyeing him with no great favour, for one moment he wondered if he had made a mistake in venturing into their camp. Then a voice behind him made him jump.

'Well, stranger, what's ther gyme?'

He swung round so quickly that two of the Eskimos, evidently anticipating some hostile action on his part, flung themselves upon him, ripping his arms, and holding him so that he could not move. For the moment he had little time to do so, and without the slightest attempt to struggle, stared amazedly at the man who held him. He was much taller than the average Eskimo, and though he was habited like the other men in the camp in *anorak* and breeches and *mukluks*, his eyes were blue, his hair and beard of a flaming red; and he was unmistakably a white man. As he looked at him, Carwyke thought of the golden-haired girl, and found in this man the explanation of her presence among the dark-haired natives; then he answered quietly, 'I should like to know yourself.'

The blue-eyed one looked at him keenly, then took the pack upon his shoulders with the tools, and after a moment spoke again. 'You ain't one o' that crowd back there?' He jerked his head in the direction of the tundra as he spoke, and Carwyke made haste to reply.

'No! I should have thought that was pretty plain. You must have seen them shooting at me.'

'Yep,' snapped the red-haired one in answer, 'I didn't see 'em hit you. An' that eagle-eyed one is a dandy shot with a rifle.'

'Think you, then, that the shooting was a bid to secure my safe admission into this camp?' asked the prospector sharply. 'Well, I can assure you it wasn't. Those two men were really trying to get me, and would have done so if they could.'

'But you've been to their camp? You went back with that feller when he came for you, a few hours back?'

'Well,' laughed Carwyke, 'you didn't give me much encouragement to come this way, did you? You simply pinned me behind that boulder until Standifer came to my help.'

'Maybe we did make a mistake, stranger,' replied the other, with a broad grin. 'But Miss Norma took you for one o' them blushin' pirates back there, an' when you followed 'er she was sure.'

'Miss Norma! That's the golden-haired girl I saw?'

'Yep! Golden-haired an' golden-eared, one o' ther best they makes in——' He broke off, and then chuckled. 'I near got you this afternoon. Once I thought I had.'

'You hit my pack. The bullet-hole is quite plain.'

The man laughed, then chuckled, and a second later suspicion shone in his blue eyes again. 'What made you leave that crowd?'

'Because I didn't like them much, and because I had an idea that they meant harm to the white girl whom I saw—Miss Norma, as you call her.'

'You was dead right there!' replied the other sharply. 'But how did you come by ther idea?'

'Well, that man Standifer explained your hostility to me this afternoon by saying that you had a white girl captive here, and that you were determined not to let her go—'

'An' you believed ther liar?'

'No. I had seen the girl, remember—at a sufficient distance from this camp to have made her escape to Standifer's if she had so wished. I was a white man, and if the situation had been as Standifer said, she would have run to me instead of fleeing from me. Her flight plainly gave the lie to the fellow's statement, though I didn't tell him so; indeed, I didn't let him know that I had seen the girl at all, or he might have been a little more careful in his explanations. Add to that the fact that an hour back I heard him talking to one of the bunch, and learned that behind his anxiety to get the girl there was some reason that I was not to know, and you can understand that I was not particularly anxious to help him in a scheme that I suspected meant no good for the girl.'

'So you kem along here?'

'Yes.'

'You took fine chances, Mista What's-ya-r-name?'

'Carwyke is my name.'

'An' mine's Billy—Eskimo Billy from here to Point Barrow or wherever the whalers go,' answered the man with a short laugh. 'But as I was a-saying, Mista Carwyke, you took some hair-raisin' chances.'

'I anticipated them when I crept out from Standifer's camp. But I hoped when you saw me with my hands up you would understand that my intentions were friendly.'

'I durn near pot-shotted you, an' if them

skunks back there hadn't started ter get you, I guess I should ha' done. Even as 'twas I kem near doin' et, for I don't trust them pirates, not one blessed inch!

'Why is Standifer so anxious to get Miss Norma?' asked Carwyke, striking to the heart of the mystery.

'Search me! I'd give my front teeth ter know. 'Tain't ther ordinary human motive, as you might say, in abduction cases; thet I'll swear. If 'twas, 'twould be plane sailin' an' easy sizing-up; but I'll wager my chances of heaven thet when he kem here 'twas ther girl he was lookin' for, though why he wants her has me beat. I don't reckon ter understand, an' I'll stand a flagon o' ther forbidden juice ter ther man who'll put me wise. Et's a regular dime-novel for mystery, an' I jest can't get ther hang of et.'

The man's weather-beaten forehead was creased in a frown as he spoke, and there was a worried look in his blue eyes. For a full minute he stood silent, considering the problem; then, staring out over the tundra, which had its normal aspect of silent desolation, he said suddenly, 'Better come an' see Miss Norma. These rascals across there won't trouble us for a bit. Tak' off yo'r pack; you'll be easier without et.'

He spoke a word or two in Eskimo, and the two natives who had held Carwyke fell back. The prospector unbuckled the straps, lowered the pack to the ground, and, as one of the men took charge of it, began to walk with the white man between the lines of tepees, many of the natives following behind them, jabbering and full of curiosity. In the course of a couple of minutes they arrived at a large tepee standing a little apart from the rest, with the flaps closed. The man Billy drummed with his fingers on the caribou-hide, a girl's voice answered from the interior, and then the flaps of the tepee were thrown open, and the girl herself stood revealed.

Carwyke stared at her in wonder. She was almost as tall as himself, and was dressed in every respect like an Eskimo woman. Her beautiful hair no longer hung free, but was plaited in two long tails, tied at the ends with strips of deer-thong, and hanging well below her waist. Her face was of classic mould, and the eyes beneath the arched brows of gold were blue as tropic seas, with a sparkle as of gems in their depths. Her skin was bronzed with the sun and the sea-winds, and, unlike many faces in the Arctic, quite unscarred by frost; her neck, exposed by the loose *anorak*, was firm and round, and even the native garment of fur could not hide the bosoms just swelling to the roundness of womanhood.

For a moment he stood dumb before the vision. Through his mind shot a tag of half-forgotten verse: 'A daughter of the gods, divinely tall, and most divinely fair.' Then,

with the blue eyes staring at him gravely, he took off his cap, and at the same moment found his tongue. 'How do you do, Miss Norma?'

A flush of wonder came in the girl's eyes.

'You know my name?' she asked in a voice that had a slight American intonation.

'Billy here told it to me,' he explained; and then turned to his conductor. 'Introduce me, Billy.'

The white Eskimo grinned. 'I dunno as how I knows ther form, but this is Mista Roy Carwyke, an' he's run away from those devils down by ther little river, Miss Norma. They tried to get him, which explains ther shootin' thet's been goin' on.'

The girl looked at Carwyke with measuring eyes, then a half-smile played about the perfectly moulded lips. 'You are the man I saw this afternoon?'

'Yes,' answered Carwyke simply. 'I shouted to you to reassure you—'

'And instead lent wings to my heels!' she interrupted, with a laugh that reminded Carwyke of the mellow sound of English bells. 'But I mistook you for one of those bad men across there, and it was natural that I should not wait to listen to explanations.' Her laughter died suddenly from her eyes, and she looked at him challengingly. 'You went to the camp of that man Standifer, afterwards.'

'Yes! When your people were pot-shotting me, as I have explained to Billy here, Standifer came along to my help; and when he invited me, naturally I went to his camp.'

'He was a stranger to you?'

'Yes.'

'Did he tell you anything about me?'

'Yes.'

At some length he recounted all that had happened from the moment when, after the first shot, he had dropped behind the boulder on the spit, and as he finished the girl thrust out her hand.

'Now I am sure you are my friend. Won't you come inside the tepee?'

'Gladly!' answered Carwyke, as he took the offered hand.

Two seconds later he had fresh cause for wonder. Just what he had expected to find in the skin-tent he could not have told; but the reality surprised him. At the far side of it was a camp bedstead of wood, covered with a rabbit-skin robe. A dressing-chest with a small mirror stood near by the bed; and on another side was a tiny bookcase full of books, against which leaned a rifle exactly like Carwyke's own. There were a couple of camp-chairs with seats of hide instead of canvas; a straight-backed chair stood by the small table; and on the wooden floor were two white bear-skins. As he stood, cap in hand, wonder in his eyes, the girl waved him to a chair.

'Please be seated, Mr Carwyke, and we will sit. You may smoke if you like. My father used to smoke when he talked.'

Carwyke had long ago dismissed his thought that Eskimo Billy explained this white girl of such beauty. The deference which the man paid to her proved she was not his daughter, and her last words set the seal to that proof.

'Your father?' he asked. 'He is dead?'

A look of utmost sadness came on the beautiful face. 'I do not know,' she said. 'Three years ago he was lost in an ice-floe, in circumstances that were rather strange, and we have heard no word of him since.'

A light of sympathy shone in Carwyke's brown eyes. To his mind a man lost on a moving ice-floe three years ago, with no word of him since, must be reckoned among the dead. He did not utter his thought, however, and the girl spoke again. 'You are a wanderer, or you would not have found your way here; tell me, have you heard anything of a white man being found adrift anywhere on the coast?'

Carwyke shook his head. 'No! I was at Esbome two springs ago, and saw the body of an Eskimo taken from a floe drifting southward; but I have heard nothing of any white man being found in such circumstances.'

For one moment the blue eyes were blurred with tears; then the girl whispered, more to herself than to the two men, 'I fear that he was lost.'

'That's not ter be taken for granted, Miss Norma,' broke in Billy in a stubborn tone. 'Things move mortal slow up here. He may have been picked up by a whaler, or carried a long way south; an' there ain't no express trains running ter Unapik thet I knows of.'

'No, but three years——'

The girl broke off without finishing, and looked at Carwyke as if hoping that he would contradict the thought in her mind. But the wanderer had not the heart to do so. It was no use trying to sustain the girl with false hopes, and he did not attempt to do so. Instead, he asked a question. 'You said the circumstances of your father's disappearance were rather strange; just what did you mean?'

'He was out with his kayak, after seal, and was observed to land upon the floe and fasten the kayak with an ice-anchor. Later the skinboat was found down the coast with the hide thing severed half-way!'

'A sharp edge of the ice, perhaps——' began Carwyke, offering the explanation that instantly leaped to his mind.

'No!' broke in Eskimo Billy emphatically. 'It had been cut through with a sharp knife. No ice-edge thet ever was could ha' cut et so clean.'

'But who could have done such a thing?' cried Carwyke.

'That's what fair beat us—till three weeks back,' said Billy quietly.

'You see, Mr Carwyke, my father had no enemies——'

'Thet we knew of then,' interrupted the white Eskimo; 'but I've done a bit o' thinkin' lately, an' I reckon thet Mista Mannering had an enemy thet we didn't know of then, nor him either.'

'Billy entertains the idea that the leader of the men across the tundra there was the man who cut the painter of my father's kayak, and I can't shake his conviction.'

'Nor ever will, Miss Norma! Et's sense thet I think. Yo'r old man hadn't an enemy on all ther coast, nor any thet didn't wish him well, except maybe a whalin' captain or two thet wanted ter get ther tribes' whale-bone an' hides for a song. But they're out of ther picture, for ther fleet didn't pass Unapik till a good three weeks after Mista Mannering was lost. But thet vulture-faced devil across ther tundra had gone down ther coast with dogs a week before. I knew him as soon as ever he landed from his schooner nigh on a month back. An' who knows how far he went? Ther camp was busy getting ther spring trade ready, an' nobody went far afield. Ther scoundrel may hev camped down on ther next big bay, or in a hollow of ther tundra, an' taken his chance when et come.'

'But why should he do such a villainous thing?' asked Carwyke wonderingly.

Billy threw up his hands. 'Thet's where you start me guessin'! Ther man was a stranger to Mista Mannering, who had lived up here nigh on twenty years, workin' as a missionary at his own expense, an' why ther feller should want ter murder ther whitest man thet ever breathed on this coast leaves me beat; but murder him he did, or as good as, I'll stake my eternal hope on that.'

'But——'

Billy interrupted him heatedly. 'An' why did he come back here three years afterwards an' try ter carry off Miss Norma on his blasted schooner? Tell me thet, ef you can!'

'He tried to do that!'

'Yep! An' he come near doin' et too. There's a whole lot o' this dime yarn thet you haven't heard yet. An' if you've patience to hear et, Miss Norma an' me'll make a shift ter tell et you.'

'For heaven's sake get on, man!' cried Carwyke. 'I'm burning with curiosity.'

'Then I'll light a pipe, with Miss Norma's permission, an' you shall hear a few things that'll open yo'r eyes jest as wide as they'll go.'

With quite exasperating slowness the man proceeded to pack a much-burned pipe, whilst Carwyke watched him with impatient eyes.

'Got a fire-stick?' inquired the man when the pipe was ready.

Carwyke handed him a tin box of matches. Eskimo Billy struck one, nursed the flame with the carefulness of a man who knows that a match may make the difference of life and

death; then, when the pipe was going, he looked at the wanderer once more, and began his story.

(Continued on page 56.)

THE BIGGEST TREASURE HUNT OF THE AGE.

CHAPTER IV.—ATTEMPTS AT RESCUE.

IT is recorded to the credit of the Dutch that when the governor learned of the wreck of the *Grosvenor* and the story of the survivors, he equipped and sent out a large rescue-party, in spite of the fact that there existed a state of war between Holland and Britain.

This is known as Müller's party, and is mentioned in many old records about the *Grosvenor*. It consisted of one hundred white men, three hundred Hottentots, and a large number of wagons and oxen. Captain Müller was in charge of the expedition, and had orders to proceed, if possible, to the scene of the wreck, trying to find any survivors *en route*; also to bring back what he could from the wreck on the wagons. Evans went with the party as guide, but Hynes was too ill to travel. The rescuers were well provided with what is known as 'Kaffir truck,' consisting of beads, blankets, copper wire, tinder-boxes, &c., to enable them to trade with the natives and prove that they were on a friendly mission.

The first of the shipwrecked wanderers who were found were Thomas Lewis, William Hatterley (or Hubberly), and another man whose name is not recorded. Farther on they found eleven lascars, members of the crew, who had with them two black women who had been the servants of Mrs Logie and Mrs Hosea. These told the rescuers that about five days after the party to which Hynes had attached himself parted from the captain and the ladies, they also had hived off, but what became of those they quitted they did not know. Later they saw the captain's coat on a native, which led them to believe that he must be dead.

Unfortunately the expedition was not successful. Captain Müller had a lot of trouble with the natives, who strongly objected to the party travelling through their country, and put all sorts of difficulties in its way. At last they flatly refused to let the wagons proceed. The wagons were perforce sent back, and Captain Müller and some of his white men went on for a farther fifteen days on horseback. But, the natives becoming more and more hostile, they were forced to abandon the undertaking, and returned after being absent about three months.

Captain Müller returned to Swellendam with his party, having with him also the three white men, seven lascars, and the two black women whom he had found, also the boy Price and his two guides, Evans and De Larso. The blacks

were kept at Swellendam, and the Englishmen were sent to the Cape, where, having undergone a long examination by the governor, they were permitted to take their passages to Europe on board a Danish ship then lying in the harbour, which was in want of some extra hands. The captain of the vessel promised to land them in England as they passed through the Channel, but, being short-handed, he did not keep his word, and took them on to Copenhagen, excepting the lad Price, who was landed at Weymouth.

After the unsuccessful Müller expedition, another effort was made to find any survivors there might have been from the hapless *Grosvenor*, this time a private effort by Captain Vaillant, but he was no more successful. All he learned was what he gathered from very indefinite stories told by the natives, from which it seemed that the men of the captain's party had all been killed, but that the unhappy women were kept for a worse fate.

These stories are somewhat confirmed by a legend which exists in Pondoland even to-day concerning white women at the kraal of the chief, supported by the evidence of traders of the early part of last century, about almost white people with whom they came into contact when trading in Pondoland.

Hynes's account does not contain a full list of the persons who lost their lives by the wreck of the *Grosvenor*, but the following full particulars appeared in the *Gentleman's Magazine* for September 1783, the year after the disaster took place.

'Arrived in London.—Robert Price, Barney Larey, J. Warmington, and Thomas Lewis.

'Taken to Copenhagen (and afterwards returned to London).—William Hubberly, John Hynes, Francis Feancon, and De Larso.

'Left at the Cape.—Jeremiah Evans and some of the lascars.

'The following persons were in Captain Coxon's party, of whom no accounts are on record, so their fate will remain a mystery for all time: Mr Logie, chief mate; Mr Beale, third mate; Mr Harris, fifth mate; Mr Haye, purser; Mr Nixon, surgeon; Robert Rea, boatswain; John Hunter, gunner; William Nixon, quartermaster; John M'Daniel, carpenter's first mate; James Mauleverer, second ditto; John Edkins, caulker; William Stevens, butcher; Frank Masoon, Dom. Kircanio, Joseph Andree, Mathew

Bel. Roque Pandolpho, John Stevens, John Pope, seamen; Joseph Thomson, chief mate's servant; James van de Steen, boatswain's ditto; John Bell, gunman's ditto; Ant. da Cruza, captain's cook; Patrick Fitzgerald and John Hudson, discharged soldiers from Madras; and Col. Espinnette.

'Passengers left with the captain.—Col. and Mrs. James, Mr and Mrs. Hosea and Miss Hosea, and two children called Saunders and Chalmers; Mr. Logie, Mr. Newman, Capt. Walterhouse Blair, Miss Dennis, Miss Wilmot, and eight black servants, men and women.

'The following died on the way to the Cape: William Thomson, Thomas Page, Henry

Lillburne, Law (a young lad), Thomas Simmonds, Robert Auld, William Couch, Ian. Jonesque, All. Schultz, Thomas Parker, Patrick Burne, R. Fitzgerald, John Blain, all seamen; Messrs. Williams, Taylor, and John Sussman, passengers.

'Left in different places, exclusive of those left with the captain.—James Thompson, George Read, Mr. Shaw, second mate; Mr. Trotter, fourth mate; George Creighton, Lawrence MacEwen, Edward Monck, John Squires, Isaac Blain, William Frueel, Chas. Berry, James Simpson, Jacob Angel, John Howes, and John Brown, seamen; William Ellis, Edward Croaker, and James Stockdale, discharged soldiers.'

(Continued on page 51.)

GREETIN' HOWE.

PART III.

FOR a moment I didn't see the connection; then it jumped at me. Of course the only time when a man lurking in the subterranean passages of the Howe could get out and in again was within an hour or so on either side of low-water; then only was the aperture in the bottom of the rock clear. His lurking-place itself must always be above water-level, but low-tide was the only time he could get out or in.

My face showed Roddy he had won me over at last.

'Conclusive?' he cried, jumping to his feet. 'There's not a doubt of it. Black Hugh Forgan's down there under our feet at this moment. And to-morrow at low-water down we go and catch siccar.'

The following morning, however, there was something of a set-back. That hot-headed Roddy must needs have a row with the police inspector, which ended in their parting in high dudgeon. The inspector was not a conspicuous genius, but he was a well-meaning soul, and his men were, it appeared to me, essential to our present project. For the meantime Roddy seemed to have knocked that project on the head.

I got down too late for the actual quarrel, having had a second miserable night—for which I was not much to be blamed. Roddy and I had sat late talking, and just after eleven had struck he drew me out into the avenue for a breather. It was a dead still night, with that miserable fog still hanging round, and not a sound to be heard but the drip of it condensing on the trees. Suddenly from the Greetin' Howe side of the house, and quite close to us, there came an odd whirring noise. I had heard the same sound often enough before, but for the moment I could only think of a flock of birds. Roddy, however, had me by the arm in an instant, and

fairly ran me into the square of light beside the hall-door, which he crashed behind us.

'No risks, old son,' said he. 'Did you hear those sheep bolting?'

'Sheep, was it?' I said.

'Sheep it was. Well, sheep don't bolt in the night without reason. What were they bolting from, eh?'

'What do you suppose?' I asked him. He pulled a stump of pencil from his pocket and scribbled some figures on an old envelope.

'I don't know,' he said, 'but it'll amuse you to hear that it'll be dead low-water in five minutes' time.'

Well, nothing more happened; but, as I say, the net result was that I never closed an eye till five in the morning, and then dropped into a dog-sleep which lasted till nine. When I got downstairs still half-awake, the inspector was marching away up the avenue, showing a very unpromising back to Sleat. Roddy, I gathered, had explained his theories, and the inspector had not been convinced, had indeed hinted at a better clue in Knoggan, in the house of Forgan's old witch of an aunt. Then Roddy astounded me by proposing that we should do without the police and tackle the venture by ourselves.

'My dear man!' I expostulated.

'All right!' he snapped; 'I'll go without you.'

It was only the knowledge that, in one of his tempers, he was quite capable of putting this into execution, that made me consent to his crack-brained scheme—also, perhaps, the feeling that when he was ready to risk so much on my account it ill became me to hold back myself. Besides, I knew quite well I could not stick out many more of these dreadful nights with the idea of this fearsome creature prowling round the house after us. I made one stipulation, however.

'We'll go down to the Howe when you're

ready to start down the tunnel,' I said, 'and not before. If I have to sit listening to that damnable place for an hour or so first, I'll run for it.'

'Right you are,' he said. 'We needn't start till after eleven. I'll go down now and shove in that last sheep.'

He went away, whistling cheerfully, and my spirits rose a little with his. I lay claim to no special degree of courage, but anything was better than this waiting about, with the knowledge that somewhere in this God-forsaken triangle of land there lurked and crept a fiendish creature, whose one idea was to kill me out of hand. I shouldn't have called myself superstitious either till I went to Sleat; but that naked, yellow house and that dreadful Greetin' Howe daunted me. If some persuasive soul like Roddy had sat down to argue that Forgan was a disembodied creature of evil launched on us by some vindictive chastising power, I well believe I should have listened solemnly to it all, and ended by half crediting it at least.

I had never heard the Greetin' Howe silent till we crept into it that morning. The water had all run out, the bottom of the loch was bare, and I swear you could have heard a pin drop. We had put on rubber-soled shoes—the kind we used to call 'gym' shoes—and, so far as human beings can be, we were noiseless. No bird called; every sheep seemed to have wandered miles away. I never had so chilling a sensation of walking into an ambush. It was just as if the whole place were lurking for us. I laid a hand on Roddy's arm.

'We're mad,' I said. He turned to me, and I saw from his face that he was actually and undoubtedly enjoying himself.

'He's at home, I'll bet,' he said. 'He wouldn't come out at a time like this. Too risky. Give us a few more minutes, and we'll know some more about him.'

Getting down into the basin of the loch was more a question of sliding on the wet rock than actual climbing, and we finished it up with a glissade that brought us to the mouth of that black hole in the corner, which I am perfectly convinced no other two men in all this county would have entered. It was smaller than one had thought from above; in fact, it was nothing but a crack. A sill of harder rock projected slightly, and under this the water had worn its way. To get under that sill was a question not merely of doubling, but of hands and knees; it was as black as a wolf's mouth, and as silent as the eternal tombs. If ever there was a death-trap, that was one.

I think our resolution pretty nearly failed us; but in the end we made the plunge, and went into the abominable place, an inch at a time, and listening all we knew. After a yard or two we were enveloped in a darkness like black velvet,

and, of course, we daren't show any sort of light. Somewhere in front was a gurgling, trickling sound, like some vile old man laughing at us; it was most particularly horrible. Then the smooth rock on which we were crawling took us round a corner, and far away down the cleft we saw a greenish radiance, and heard the lap of the sea. Beyond that there was not a sound, and the darkness behind us was solid.

Roddy laid a hand upon my arm, and I felt him leaning towards me. I don't know what he was going to say, and I never shall, for just at that moment the silence was broken by a most horrible sound. It was a sort of wavering groan or growl, followed by a sharp-cut cough. It might have been a beast, or it might have been human; or, if one conceived the Greetin' Howe as endowed with some miserable thing that was neither one nor the other, then it might have been just that. I know I felt that sensation which is commonly described as hair-raising, and Roddy's grip on my arm tightened to an unbearable degree. It was impossible to tell from where the noise came; it seemed to come from everywhere and nowhere, but certainly from no great distance. It was not repeated, and the silence fell again behind it like a shroud.

I became aware of Roddy tugging at my sleeve, and found my legs turned to ice. Literally, I couldn't move.

'Come back, you fool!' he whispered. 'Come back! That's him!'

If we went in by inches, we came back by halves and quarters. I never thought to see the Greetin' Howe with anything approaching joy, but I was joyful enough to see it again then.

We climbed out of the loch—by no means so easy as getting down into it—and Roddy led the way out of the Howe and over to the cliff-tops where we had sat the day before. The first thing we saw there was his third and last sheep floating serenely in the sea.

'More data,' said Roddy, grinning. 'Poor brute! I might have spared it, for I don't think we want any data now. That was Black Hughie all right.'

'I suppose it was,' I said.

'Either him or the devil, and we'd better presume the former till we can prove the latter. No, Drew, it was Black Hughie, and your troubles are nearly over.'

'He sounded pretty queer,' I said.

'You haven't been much in asylums,' said Roddy; 'I have. They make noises like that. It sounds bad enough in a mad-house, but, by Heaven, it sounded worse down there.' He lit a cigarette with a hand that shook a little. 'You don't think me a funk for backing out?'

'My dear fellow—'

'I'm glad of that. I thought you might want to go on; but it would have been sheer

lunacy. He must know the ground down there, and his eyes must have got used to the darkness, and in that cursed whispering-gallery it was perfectly impossible to tell where he was. He wasn't many yards from us, but he might have been above or below, left or right. If we'd gone on we'd have been scuppered.'

'For sure,' I said. 'If it came to a fight, I should want it on our ground, not his.'

Roddy threw away his cigarette half-smoked. 'Well,' he said calmly, 'that'll be the next step. It isn't going to end here.'

'Our next step,' I said, rather crossly, 'will be to inform the police of what we've just found, and let them apprehend their man any way they think fit.'

His face changed in a moment from triumph to rage. He jumped to his feet. 'All right!' he said. 'Then I may as well take the train back to Edinburgh. I'm sorry I butted in at all. I'll have nothing to do with these damned police, and you can choose between us.'

He led off to the house at five miles an hour, with myself, a somewhat undignified figure, trotting and expostulating at his side.

VI.

In the end, as before, Roddy had his way. I admit it was an insane agreement, but from this point onwards our actions were sheer lunacy, neither more nor less. Looking back from decent, decorous Edinburgh chambers, I am beat to recapture the odd self-reliant enthusiasm that came upon me in those last days, or to comprehend how I could ever have committed myself to such idiotically desperate enterprises. I suppose that somehow at Sleat, with air, earth, and water conspiring, as it were, to cut one off from humanity, one became reduced to elementals. In any case I know that before we had got back to the house that morning Roddy had infected me with his own daft recklessness, and I had agreed to dispense with the police and fall in with his scheme.

This was simple enough—crazily so. Black Hugh was in the tunnel, and at low-water he must come out. All we had to do was to 'sit up' for him, in shikar parlance, and down him as he emerged.

I made a last feeble objection, however. 'Not you and I alone, Roddy. We must have somebody else. And if it's not to be the police, who is it? You wouldn't drag in poor old Kellock?'

'Kellock would be game,' said Roddy. 'But I agree it wouldn't be fair. But what about Robb? He'll join like a shot.'

I laughed at him. But he was right, after all. With that uncanny knack of his for nosing out relevant information, he had discovered that Robb had a mortal antipathy to the local police. Some officious constable had once run him in for riding without a light, or some such trifle, and

since then there had been a sworn feud between them. Robb was an adventurous soul, and the bait of a score against the police was just the inducement to bring him in with us.

We bolted some lunch, and walked across to Pitsadden by the path Janet Rae had taken when she saw her horrible vision. Robb senior was out and the young man in, which was as we desired. He welcomed us into an extraordinary best parlour, reeking of camphor and varnish, and there Roddy unfolded his tale.

Roddy's plan was delightfully simple; we were to arm ourselves with guns or rifles, sit up over the loch, and shoot down Forgan as soon as he appeared. Neither he nor Robb seemed to see anything impossible in this idea, till I pointed out that even in Sleat we were in nineteenth-century Great Britain, where such conduct was not encouraged. Instead of scoring off the police we should be ignominiously run in for homicide. That gave them pause, but not for long. In fact, I believe the hare-brained pair actually preferred the notion of coming to grips with this monster.

'If there's light,' said Robb thoughtfully, 'I can throw a lasso. We had a cattleman once who'd been in the Argentine, and he taught me the trick. I'm a fair hand at it, given light to see by.'

'And if it's dark,' said Roddy, 'he must just be scragged. Cheer up, Drew; we'll have him all right. Suppose it done, as Euclid says.'

I shudder yet to think what the results of this insane venture might have been. But the odd luck that seemed to have favoured my dealings with Sleat again stood between us and what might have happened. Conceivably, Robb might have hurled his ridiculous rope with effect, or conceivably we might by a joint effort have overpowered Forgan, but I fear it would have been at the cost of death or disablement of at least one of us. I am no Hercules, worse luck; and three strong men would have hardly been a match for that frightful face that came round my bedroom-door, backed up by the traditional strength of Hugh Forgan.

What actually did happen may be told either at great length or in a very few words. We had a breathless vigil at low-water that night; an exciting one the next forenoon; a wrought-up and confident session in the night following, succeeded by one tedious and one interminably dreary sederunt. The unbearable seeping and sobbing of that accursed place came and went, rose and fell; if I live to be a hundred I shall never forget the sound of it. But beyond that absolutely nothing happened; there was no sign of Black Hugh Forgan or anybody else. At the end of the third fruitless night even Roddy's robust optimism broke down, and he fell to bitter self-reproach.

'Drew, old man,' he said, 'I've let you down. He heard us that morning after all in the

tunnel—though why he didn't come at us when he had the chance beats me altogether.'

Robb eyed his lasso in disappointed gloom, and said it looked like it. But it was my turn to be obstinate. 'It's inconceivable,' I said, 'that he heard us that day. If he did he *must* have gone for us, or at least called out or come to see who it was. He *didn't* hear us. What's the inference, as Roddy says? Probably, I should say, that the police have got between him and his food-supply, and he's had to seek another shelter. Perhaps he spotted us here and swam out. That's more reasonable, surely!'

'Well, anyway,' said Roddy, 'there's only one thing for it.' He looked at Robb, who was still playing with his rope.

'Ay,' said the farmer, 'I was thinkin' that. There's no sense in uncertainty ye can put an end to. We maun just go down and find out.'

Well, it was a task none of us relished—I speak at any rate for myself—but it did seem as if there was nothing else for it. We had a council of war that night, and, as a result, low-water next day found all three of us glissading down into that accursed loch. It was a bright morning for once, with a land breeze and scudding clouds, but that black cavity under the sill of rock looked no more inviting. Roddy was confident we should find the place empty, and I was nominally so; but we went none the less warily, and as we crawled into that abominable hole, I, for one, wondered if we should ever come out.

There was not a sound in the suffocating darkness except the drip and that satyr laughter we had heard before. But we had not gone three yards when Robb, who was as clumsy as a bullock, and, moreover, was wearing ordinary boots, slipped on the rock with a noise loud enough to wake the dead. We stopped in our tracks.

'By Jove!' said Roddy, 'that's roused him. Now for it.'

We waited for what seemed a century; the drip went on and the mocking laughter of the water, but beyond that there was absolute silence. The sweat ran on my forehead; was the bird flown, or was he lying in wait for us, or what?

We began to move forward again slowly. Robb had somehow got to the front, and it was he who made the expected discovery.

'There's a passage here,' he whispered, 'going off to the side.'

'Strike a light,' I said, 'for God's sake!'

'For God's sake don't!' said Roddy. 'Ca' canny, man; anything may happen yet.'

In dead silence we crawled up a steep slope; the slimy rock gave place to wet stones, then to stones that no water had touched for years. We were all strung-up to breaking-point, when Robb, who was still leading, dislodged a big loose block with a rumble like a cannon. Simul-

taneously there came a crashing run of boulders sliding towards us, and in that instant Robb let out a yell of mortal terror. 'God help!' he screamed. 'Here he comes!'

And come he did—fourteen stone of dead-weight that pitched down among us and sent us sprawling, and rolled stiffly and horribly in our midst. Before I could pick myself up Roddy had a match struck and the candle lit, and there was that terrible face again before us. But the great eyes stared unblinking at the light—the bared teeth would never bite again.

'Dead as a stone!' said Roddy, and his voice ran up like a nervous actor's. 'What on earth's come to him?'

It was the taciturn Robb who leaned forward and drew the rough coat away from the thing's left side; and there was a great wad of rags, rust-coloured with stale blood.

'Thank me for this, sirs,' said Robb smugly. 'I missed him on the stairs, but I'd ha' sworn before judge and jury I got him at the loch. An' so I did. See for yourselves.'

We saw. How the man could have kept going with such a wound and shown strength enough to add two victims—and nearly a third—to his list, I do not yet profess to know. Love, backed by courage, has been proved capable of great feats of endurance; hate, backed by madness, must be the same.

Roddy struck himself on the head. 'That groan, Drew, and that cough! And I a medical man. Of all the fools! I said it was a mad-man talking, and it was the poor devil in mortal agony. God forgive me for a useless ass!'

What followed constitutes a memory I do not care to recall, for we set to work, the three of us, to get what remained of Forgan out. But he was a huge man, as I have said, and in that cramped space we could move him only a yard at a stage. Time had passed more quickly than we knew, and when we got down the side tunnel and into the main cave, the water was lapping ankle-deep, and the whole horrid place was groaning and gasping in the prelude to its everlasting sorrows. No rescuers intent to save the living ever strove harder than we to salvage the dead; but the tide came at us like an army, and in the end we had to give it up and save ourselves if we could. Even at that it was touch-and-go, for the water was almost up to the rock sill at the loch. I was pretty nearly done, and I doubt if I should have got out but for the help of Roddy and the sterling Robb. I felt the loving tug of the undertow round my knees, and it is a thing I have no wish to feel again.

The ebb accomplished in its own time the work wherein we had failed. After all, Black Hugh Forgan joined the silent company of those who went 'doon the Howe,' and floated in calm indifference in the sea eddies without.

THE END.

Chambers's Journal

SEVENTH SERIES

KERAK.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

FROM the gray old castle walls the green turf sloped in gentle undulation to the lake, which is ever of a milk and coffee hue, owing to the wallowing of the ancient carp within it, and beyond the lake to the wilderness, in the elms of which the rooks have dwelt since living memory goes. A mighty rookery it is, one of the largest in the land, and there the birds assemble each spring in their thousands. Some remain the season through, but during the winter months few of the rooks roost there, preferring the shelter of the dense larch woods on the opposite slopes of the valley.

For a long time the people at the castle had commented on the peculiar call of one of the birds, which was there the year round. All through that winter they heard it, most often at dusk and daybreak, but on and off the whole day through—a shrill 'Ker-ak, Ker-ak,' as distinct from the comparatively mellow 'Caw' to which we are all habituated. One day some one commented upon the strangeness of the note, which had become so familiar that it might for ever have escaped comment, whereupon a friendly discussion arose as to whether one bird only was responsible, or whether various birds uttered the call as a natural part of the rook vocabulary. To settle the point the keeper was sent for and his opinion asked. 'That,' said the man, 'is the call of a very old rook—one of the leaders of the clan. His word goes, and as he has a special call of his own, the others do not mistake his voice.'

'Then it is one bird all the time?' asked one of the ladies.

'Maybe, ma'am. Maybe two or three of the old leaders have the same call.'

That cleared the discussion up to a certain point; but there was one point more. Was it because the bird was old and his voice was broken that he called thus, unable to utter any other note, or had he purposely assumed a tone and accent that the rest might know him?

This question all but floored the keeper, but he rose manfully to the occasion. He thought that the call was quite a natural one, and its peculiarity owing to the age of the

No. 682.—VOL. XIV.

bird. Being very old, and therefore very wise, the rook had automatically become a leader. The old birds invariably were the leaders. Almost invariably they had cracked and broken voices. Thus, indeed, does Nature attain her ends.

II.

Now, all this seemed a good random shot on the keeper's part, but he happened to be somewhat wide of the mark. That the bird with the strange voice was a very old bird was possibly true, but he certainly was not a leader. Nor if he lived to be a hundred would he ever rise to that position; for, far from leading, it was not even for him to follow.

Whether it was through sickness or as the result of a wound that Kerak became earth-bound, deprived of the infinite powers which were rightly his heritage, I cannot say. He may have been crippled from the egg; he may, indeed, already have lived a number of years in the rookery ere the breaking of his voice singled him out for human attention. But of this I am sure—that that voice of his was assumed, and for a very excellent reason. He could caw like any other rook when he chose, but that 'Ker-ak, Ker-ak,' was more commanding, more far-reaching, and was known by all his clansmen for what it was.

Though unable to fly at all, Kerak, with his wings half extended, could make astoundingly good progress from branch to branch. He could, for example, pass in a few seconds from the topmost branch of the topmost elm to his drinking-place at the lake edge, whence another light but ungainly hop would take him into a green syringa bush, thence into the branches of a stunted larch, across to the fork of a dead ash, and a second or two later it was all straight sailing to any part of the sunlit tree-tops which he loved. He came and went always by his own favourite ladders and bridges; he had his runways in the branches as have the squirrels, just as the rabbits have their chosen creeps through the greenery below.

In the centre of the wood there was a dense clump of blackthorn, and it was owing chiefly to this friendly thicket that Kerak, though so often heard, was seldom seen. In summer the

[All Rights Reserved.]

DECEMBER 22, 1923.

leaves offered shelter enough, but in winter Kerak would have fared badly but for that thicket; for it served to hide him not only from his foes, but also from the fury of rain and gale. There, when the wind blew hard, Kerak would sit, warm and content, his feathers puffed out. There, when the frost was keen, he would hide himself from its keenest edge, for of all rooks he, at such times, had no need for anxiety. His next meal would come all right. If there was food in the land, he, the impotent, would not want. And for the depths of that thorn-bush Kerak would head at the sound of human feet, or at the first glimpse of a winged foe overhead, seeming scarcely to tap the branches as he fell, for he was wise in the knowledge of his weakness, and he took no chances. So well able to hide himself was he, so alert and quick on the few occasions when indeed he did come before human observation, that circumstances were all in favour of his escaping notice as a disabled bird.

III.

Having regard for all the facts, I believe that Kerak might have fed himself quite ably. Many green glades there were in that sheltered wood to which he had free access, and since the other rooks never fed there, there surely was food for one. But not one morsel of food did Kerak obtain for himself. He lived entirely by the labours of the other rooks, and he was the spoilt and pampered darling of the colony. They knew that call of his, as well they might, and he had never to utter it in vain. At the day's breaking, when the rest flew back and forth, he would call and call repeatedly. At the sight of another rook overhead his shrill 'Ker-ak, Ker-ak,' would ring above the clamour of the rest, and any one carrying food would hasten to his side. Others, moreover, would hurry out, presently to return with food, for Kerak always kept on calling till he could stuff not another morsel, his voice becoming stifled and dim as one after another they rammed the choicest fare into his gaping bill, while he flapped his wings and created absurd squealing noises, like a squab from one of the nests.

Why they loved him as they did I do not know. Perhaps he had been a great rook in his day; perhaps he had done something to advance the community; perhaps he had lost the power of flight performing some heroic deed. But the darling of the clan he certainly was, for every community must have its poor man, its outlet for charity, and when there is charity to spare there are always those ready to exploit it to its dregs, not necessarily impostors, but those who are prepared to make the most of their need.

IV.

One day there was a great stir in the rookery. It was while the people at the castle were at

breakfast, and suddenly they were startled by wild cries of 'Ker-ak, Ker-ak.' This was an unaccustomed hour for the call, for usually it came with the day's breaking, to be heard dimly through one's waking dreams, or as one awoke to the new-born day. Moreover, the call was uttered in frenzied, eager tones, which seemed to denote a state of dire distress, and rising from the breakfast-table, the family witnessed a strange spectacle.

Kerak had evidently been ambushed at his drinking-place, for now, having by misadventure been driven from familiar territory, he was hopping up the greensward towards the house in gigantic bounds, while at his heels bounded a huge brindled wild-cat, bristling and immense. Not a genuine wild-cat this, but a renegade from man's hearth, which, becoming wild in character, had acquired also the semblance of the Wild. The rook was making noble efforts to escape, but that he was doomed unless a miracle occurred was clear to any one.

But a miracle *did* occur, for in response to those frenzied calls the air, it seemed, became instantly full of rooks. In strings and clouds they came, and Kerak was enveloped in a lashing haze of wings. Next moment the cat was seen bounding back for cover with a whirling army at his heels, and when the air cleared a minute or two later evidently Kerak also had made good the trees, for he was nowhere to be seen. But all morning there was much excitement in the rookery, and the sharp, shrill cry of 'Ker-ak, Ker-ak,' signified that our hero had no minor opinion to express.

V.

Things were changing at the castle, as at a thousand other noble houses. The laird was becoming prematurely gray; so was his old factor. Often they talked long and earnestly about ways and means, and soon the old factor went his way, and the laird shouldered his sorry task alone.

Next spring the grass grew lush on the gentle slope between the castle walls and the pond, save for a single belt about the house. Unkempt and wild the borders grew, and the still small voice of poverty spoke from a thousand mossy nooks and alleyways. Yet another year, and the place had changed hands.

'Walter,' said the new tenant—hitherto the keeper had been known by the name of Briggs—'can't you shoot that bird with the infernal croak?'

'Yes, sir, I can shoot him,' replied the man. 'He's been here a long time, but I can shoot him if you want him shot.'

'Shoot him, then,' was the brief response.

So Kerak was shot, and as he fell a thousand of his fellow-colonists rose cawing, wheeling, and darting, and filling the ancient wilderness with such a tumult of sound that the keeper felt some dire punishment must follow his deed. More

rooks came and ever more, till the whole sky was black with them. They seemed to shut out the light, so many were their drifting shadows, and never before had the keeper seen such wild excitement among the people of the elms. He picked the dead rook up. Very old it clearly was, but from the lustre of its plumage its life had lacked for nothing, and feeling that he had done but a useless thing from which no good could come to man or bird, he tossed the

dead rook into a blackthorn thicket near, and sadly went his way.

And so my story of Kerak ends. It is but half a story, a dim sidelight, a sordid finish, and one feels that there must have been something for which Kerak was so beloved by his fellows. So surely it is with all dramas of the Wild. We can record but little—an incident, a discovery, and the curtains close. The first scene or the last is ever missing.

THE BIGGEST TREASURE HUNT OF THE AGE.

CHAPTER V.—SALVAGE EFFORTS.

AS was to be expected, soon after the wreck of the *Grosvener* efforts were made to salvage the ship and recover her treasure. What she carried soon became a world-known fact; and, to judge from the stories of her position, right on the shore, as described by the survivors, it seemed that there would be no insurmountable difficulties for a properly equipped and organised salvage party to reach her and recover the treasure.

The first attempt was made within a year of the disaster by the British Admiralty, which sent out a well-equipped expedition, with expert Malay divers—in fact, everything calculated to make the venture a successful one. But even these experts in all matters appertaining to the sea did not realise the almost impossible proposition they were up against. Fully to realise the difficulties the coast must be seen—rugged and forbidding, with the mighty combers of the Indian Ocean everlastingly thundering inwards, and dashing themselves to pieces on the cruel and relentless rocks; no boat could live in such a turmoil. Even in calm weather the coast is a dangerous one, and calm days are not frequent in that locality. Had the ship lain farther out, away from the rocks and the breakers, salvaging operations by diving would perhaps have been possible; but lying as she is, only about ninety feet from land, it has proved to be an impossible job. Her position is curious and unique, because she is fixed between rocks, practically immovable, and was soon weighted and kept firmly in her cradle by the sand which settled over her and made it impossible for her to break up.

The Admiralty's party, after many abortive efforts and losing some of its men, abandoned the work, and returned to England with the story of the difficulties and dangers that beset any endeavour to reach the *Grosvener*.

Since then many attempts have been made to reach the ship by diving, but always the ocean proved the victor, and to-day she still lies intact, with her treasure doubtless still safe in the strong-room.

The last effort (excepting the one now in operation) to save the ship was made in 1905-7,

when the dredger *Duiker* was chartered to remove the sand from the deck of the *Grosvener*. During these operations fifteen guns and numerous coins were recovered, the latter being probably the property of the passengers; but the most important success that was achieved was that of boring through the sand and finding the timber in a good state of preservation, proving that the hull of the ship was intact.

Two of the guns recovered were presented to the Cape Town Museum, where they excited great interest.

This effort of the *Duiker* also proved a failure, because during spells of bad weather she had, for her own safety, to abandon the work and get out to sea, and by the time it was safe for her to return and resume operations it was found that Mother Ocean had again put a heavy blanket of sand over the deck and treasure. This happened over and over again, entailing heavy expenses, and leaving the victory as far off as ever; so the syndicate, having spent all its money, gave it up as a bad job, and the sea kept what it had taken.

About the time of the operations of the *Duiker* Mr William Bazley, of Port Shepstone, wrote as follows to the syndicate interested: 'I, as a practical diver of many years' experience in surf diving, for my own satisfaction, have dived down from the surface many times. I saw several guns, and I have not the slightest doubt but that the bottom of the ship lies inside the ledge of rock buried under a patch of sand. In this position it has lain, and is sheltered from the ground-swell. If there was any treasure on board, it will be found there safe enough, with leaden bullets, cannon balls, and many cases of crockery, &c., because the sea could not get at it to scatter the contents of the lower hold.'

In connection with this same attempt in 1905-7, Mr R. Wight, the engineer in charge of the *Duiker* attempt, wrote as follows from Outjo, South-West Africa, to the syndicate at present carrying on operations, in the hope of being of some assistance to the new venture:

'Being engineer in charge of attempted recovery operations, 1905-7, I feel sure the

following information will be of interest to you and your readers.

'The *Grosvenor* Recovery Syndicate, floated in Johannesburg in 1905, began operations with a very modest capital, and was staffed by men who showed such confidence in the undertaking that they accepted shares only in the syndicate in lieu of salary.

'The first and immediate aim of the syndicate was to locate the hull of the *Grosvenor*. The search, which was carried out systematically, extended for fully three-quarters of a mile on the eastern side of the gully, and for approximately the same distance seawards. No trace of the hull could be found, and we were about to abandon further efforts, when I instructed the diver to overhaul the moorings of the buoy; this act led us to the discovery of the hull. The diver had no sooner reached bottom than he came up again, got into the boat, and signalled for me to come out. He reported the mooring wire perfectly taut, and the discovery immediately made me jump to the same conclusion as the diver—the lower reaches of the gully were a fac-simile of the upper reaches. This discovery put new life into us, and without delay we started to probe the sand-bed around the mooring. We welded a long shank on to an auger stem, and at a depth varying from 10 feet to 11 feet 6 inches the diver got the auger to bite into timber at different places, and over an area which satisfied us we had at last got what we had been looking for for eleven months.

'On discussing the question as to how we were going to prove our discovery, we were of one opinion as to the necessity of getting a sample of the timber, but an auger was of no use for bringing even a chip through 10 feet of sand. Mr Dorkin, of N'Subani, who was present, had a "brain-wave," and said he could give us a wad-cutter for a 16-bore gun, which, if fixed up on to a long rod and hammered into the timber, should draw a core. Armed with our wad-cutter we went out, and you can imagine the intense excitement of all hands as we leaned over the side of the boat with our eyes glued to the water, watching the diver—the water was beautifully calm and clear—in his efforts to bring a core of the timber to the surface. Time and again the cutter came up empty; whether the core hadn't come away, or had been forced out with the pressure of sand on the top, we couldn't say, but after roughing up the face of the cutter by striking it with a saw file, our efforts were rewarded.

'During the earlier stages of operations in 1905 we did a lot of shore work, and recovered quite a lot of coins (about 250), and a lot of odds and ends, in the way of a silver brooch, shoe-buckle, a silver wine decanter label or tally with "Madeira" engraved on it, bundles of ordinary pins, but made of brass, with the heads riveted on, all stuck together in a conglomerate mass of iron rust, apparently formed

with decomposed seaweed amongst cast-iron ballast blocks; also, on breaking up this "rust conglomerate," we found many silver coins, which, when taken out, were as bright as if newly minted.

'From the upper gully we removed some 5000 tons of rock, and from the silt underneath we recovered a fair number of coins similar to the specimens shown in your photo, and cart-loads of broken china and glass. In the crevices underlying the rock ledges on the western side of the gully we found a few gold coins, including the "Mogul."

'Amongst other recoveries we accounted for thirteen of the *Grosvenor's* guns, and while Captain Turner was searching for coins, &c., Cecil Rhodes, who was very keen on salvaging the *Grosvenor* from an archaeological interest, took two of the guns which were lying 'twixt high and low water mark up to Umtata, to the headquarters of the C.M.R., so that accounts for a total of fifteen. I believe the old ship carried twenty-six altogether, and I fancy the other eleven either stuck to the ship or were shed off and settled deep in the sand when she slipped off the ledge into deeper water.

'After locating the hull, the syndicate reconstructed and raised further capital, and chartered the side-suction dredger *Duiker* from the Table Bay Harbour Board, with the object of clearing away the sand from the hulk, breaking into it, and clearing out the treasure with the divers. However, fate was sadly against us. There was a heavy influx of sand all around the coast, and the draught of water was so reduced in consequence that the *Duiker* wasn't able to get sufficiently inshore to pump from over the wreck. The coast is rough and treacherous; and, as a rule, one can only rely on two months' fine weather out of the twelve. Had the sand been washed off the coast, as sometimes happens, instead of being banked up, the attempt would have met with the fullest success.

'The plan of tunnelling, which the *Grosvenor* Bullion Syndicate is adopting in its efforts of salvaging, may be somewhat slow, but from an engineering point of view is a very sure one, and it will only be a question of a few months now when the interested world will learn what the *Grosvenor* actually carried in treasure. My opinion, formed from the two years' experience on the site, and constructed on hard fact and evidence from the guns and ballast, and the spoor of both leading straight down to the old ship's resting-place, leaves no doubt in my mind as to the hulk being there; and also from the authentic fact that the ship slipped from the ledge into deeper water, makes it a certainty to me that she was trapped and cradled in the sand-filled gully, where she now lies. She is intact, being completely protected from all the elements by the rock walls of her "graving dock."

With the failure of the attempt in 1905-7 to recover the treasure interest seemed to wane, and the *Grosvenor* was left in peace till 1921.

CHAPTER VI.—THE PRESENT VENTURE.

BUT the lure of hidden treasure is as constant as human life and enterprise, for it was unthinkable that such vast wealth should be left unrecovered for all time. As will be observed from what has already been said, up to this time all attempts had been made *from the surface*, and all proved equally futile, owing to the roughness of the water and the danger from the rocks.

Then in 1921 some one had a brilliant 'brain-wave,' and suggested that the *Grosvenor* could be salvaged by tunnelling to her from the shore, as modern engineering skill warranted such a venture.

For this purpose the *Grosvenor* Bullion Syndicate, Johannesburg, was floated; all the rights, government permits, &c., and all the information and documents relating to the position of the sunken ship *Grosvenor* and details of the treasure buried with her, as well as the original idea of tunnelling to her, have been acquired by the syndicate.

The vast strides of progress in submarine salvaging during recent years, the numerous inventions, improved methods—such as compressed air, cementation process, &c.—have encouraged the new syndicate to proceed enthusiastically, in the firm belief that it can surmount any difficulty which may arise.

In the syndicate's offices are to be seen many curios that have been found in the vicinity of the wreck, such as various coins, shoe-buckles, bits of a fork, &c., which are being constantly viewed by the public. There are also to be seen many fine photographs of the scene of operations, and telegrams with the latest information for any to see who so desires. The venture is creating widespread interest throughout the Union of South Africa and Rhodesia, and from almost all parts of the world letters are received asking for information about this wonderful treasure hunt.

At the scene of the operations *rondavels* (grass huts) have been erected to accommodate the workers, both black and white, as well as for the staff. There are also some spare *rondavels* for visitors who may wish to see what is going on.

One of the greatest difficulties that the syndicate has had to contend with is that of transport, which may be realised when it is stated that all engineering material, provisions, &c., have to be brought by road, either from St John's or from Izingolweni station, on the narrow-gauge railway from Port Shepstone.

By the former route material has to be carted about fifty miles over rough roads, and from Izingolweni the distance by road is over a hundred miles. In some cases goods ordered for the camp have been on the road for three months. Furthermore, wood for the boilers is not easily obtainable, as the forests are protected in Pondoland. An oil-engine has been erected, and the syndicate is now able to push on with the work more expeditiously. Mr C. D. Chapman, who was successful in completing the Steenbras tunnel for the Cape Town water scheme, is the works manager, and under him are a number of white men and natives. The work is being carried on like that on an inland mine, and is under the periodical inspection of the Government Inspector of Mines. It has been the custom to drill and blast about 4 feet 6 inches at a time, after which the rock is removed on rails laid in the tunnel, and is hauled to the surface by a donkey-engine at the mouth of the shaft, the rock being dumped directly above the tunnel. A vertical boiler provides the power for the compressed air used in the drill and steam for the pumping plant. At the foot of the incline a sump has been blasted into the side, to catch the water running down from the surface and for the water used in drilling.

The works manager believes that the wreck rests on the rock, and, if his theory is correct, the tunnel will be kept to the rock until the wreck is reached; otherwise it will have to be pushed through the sand which has silted over the hull. Air-tight compartments will be built in the tunnel when it approaches the wreck. If necessary, compressed air will be employed to overcome any pressure of water, and the liquid cementation process will be used to strengthen the drive and prevent the seepage of sand and water. The engineers are driving a tunnel for 450 feet through solid rock to the narrow gully in which, lying as in a cradle, the *Grosvenor* has been located. Photographs show that, though underneath the sea, there is not a single drop of seepage into the tunnel. The Table Mountain sandstone through which it has been driven is hard, uncracked, and impervious. The tunnel is, in its smallest dimensions, some 6 feet by 5 feet.

The *Grosvenor* lies in her ocean bed under many feet of sand, and it is considered possible that this sand may have already advanced far in the process of solidification, which, when the vessel is reached, will enable the salvage operations to be carried out under comparatively dry and safe conditions. In other words, it is probable that the *Grosvenor* may be found to be embedded in a natural concrete casing. Experience has proved that timbers embedded in compact sand may be preserved indefinitely, and the stout English oak, of which the *Grosvenor* was no doubt built, may be found

to be all the stouter for a century and a half of seasoning in the sands at the bottom of the Indian Ocean.

The gully in which the old ship lies is a narrow one, so narrow that when the tunnellers are through the rock they may find themselves at once against the hull. In any case it is not expected there will be more than a few feet of cemented sand to penetrate. When that stage is reached what an anticipatory thrill will be experienced, not only by the daring adventurers beneath the sea, but by all far and near who have followed the course of the quest.

When the salving operations were first started not much interest was taken in them excepting by those immediately concerned, but the time is now rapidly drawing near when the climax will be reached of one of the most enterprising, ingenious, and promising undertakings for snatching from the sea some of its long-hidden spoils. This climax will, the promoters of the enterprise are convinced, be so dramatic as to arrest the attention and captivate the imagination of the civilised world.

Whether the treasure lies intact in the strong-room of the wreck remains to be seen, but the managing director and the men on the spot are confident enough, contending that they have sufficient reliable evidence in the records available to show that the wreck and the treasure are there.

For many years past all kinds of 'treasure trove,' supposed to be from the *Grosvener*, have been picked up on the seashore between Port Shepstone and the mouth of the Kei River; and the writer remembers, when quite a little girl, finding water-worn Cornelian beads on the lovely sandy beach extending for miles near the latter place, where camping-out for a couple of months was an annual occurrence. It took careful and daily hunting during several such holidays to collect enough of these sea treasures to form a small necklace, which was greatly cherished. Since that far-away time the *Grosvener*

has meant a romance of treasure and adventure to the writer.

Among the latest finds reported by the syndicate is a valuable diamond ring, discovered near the scene of the present operations. On the diamond is engraved a small but distinct cross, and one wonders if this is a religious emblem, or if there is a further romance attached to it. Was it a mystic spiritual sign, or perhaps a love-token? Who shall say? Much of mystery will surround the loss of the *Grosvener* for all time.

It has been learned quite recently that amongst the treasures shipped on board the *Grosvener* was a considerable quantity of diamonds. A 'true copy' of 'the register of diamonds licensed by the President and Council of Fort St George to be shipped for England on the *Grosvener*, March 25th, 1782,' has been received from Madras. This shows that the value of the diamonds was estimated at 24,444 star pagodas, the standard gold currency in the Madras Presidency in those days. The star pagoda at that time being worth, say, 8s. 6d., that works out at about £10,400. What the diamonds would be worth to-day is another matter. It would be much more than that amount.

The fortunes of the *Grosvener* Bullion Syndicate are rapidly reaching an absorbingly interesting stage, and the South African press is in close touch with developments, and is keeping the public informed of all that happens. Never, even in the early days of the Rand, when one and all were rushing to make fortunes, has so much interest been shown in any venture as is being evinced in this last bold attack on the *Grosvener* to solve once for all the mystery of what she has in her hold.

By the time this article appears in print the mystery may have been solved, for the syndicate hopes soon to reach the ship. Then only will it be possible to add the final chapter to the thrilling story of the *Grosvener*.

THE END.

NOVAJA SEMLJA REVISITED.

IT was during the search for the North-East Passage in the sixteenth century that Novaja Semlja was first discovered by western Europeans. The route to the White Sea and the mouth of the Dwina was found by Chancellor on Sir Hugh Willoughby's great expedition in 1553; and in 1556 the newly-formed 'Muscovy Company' despatched another expedition to these regions, under the command of Stephen Burrough, who had taken part in Chancellor's voyage, with the object of reaching the mouths of and exploiting the great Siberian rivers.

Burrough did not get so far, but he reached the entrance to the Kara Sea and the southern

part of Novaja Semlja. He can hardly, however, be said to have been the original discoverer of that island, as it had long been known (since the eleventh century, it is said) to the Samoyede and Russian hunters, who had christened it 'Novaja Semlja'—'the New Land.'

Towards the end of the century (the sixteenth) the Dutch began their voyages to the north-east. In 1596 Willem Barents made the famous voyage, on which he first rediscovered Spitsbergen, and then circumnavigated the northern point of Novaja Semlja. On the east coast of that island his vessel became frozen in (in about 76° 15'), and the crew passed the winter on the

land. Early in the following summer (1597) the sorely tried men attempted to escape southwards in their ship's boats, and most of them reached Kola (on the north coast of the peninsula of that name, sometimes called Russian Lapland), and afterwards Holland. Not so, however, Barents himself, who died soon after starting on the hazardous journey. In the seventeenth century Novaja Semlja was visited by several Dutch and English expeditions, and in the eighteenth the Russian ones began. Of these, Loschkin's and Rosmysloff's are the best known. The latter passed through the Matochkin Shar, the narrow winding sound which divides Novaja Semlja into two.

Not until 1820 did the Russian authorities seriously undertake the exploitation of the islands. Lieutenant (afterwards Admiral) Lütke traversed and charted the main features of a considerable part of the west coast in 1821-24, and important geographical investigations were carried out on the east coast by Pachtusoff and Trivolka in 1832-35.

After that a great many expeditions of different nationalities visited Novaja Semlja, and much valuable information concerning it was collected by the professional hunters from North Norway. In their small sailing vessels these brave men—in pursuit of the walrus and the seal—roamed the surrounding waters, waters which had been considered until then impossible to navigate by reason of the masses of drift ice with which they were filled; and they penetrated far eastward into the Kara Sea. One of the best known of these veterans, Elling Carlsen, found the dwelling in which, nearly three hundred years before, Barents had passed the winter, and brought it and its contents away with him.

In spite of the many expeditions of which it has been the objective, and the very considerable amount of scientific work which has been carried out there, Novaja Semlja is still but little known. This, however, is intelligible enough. In the form of an elongated crescent it extends from 70° 30' to 77° N. lat., a distance of 600 miles; it has an average breadth of 60 miles, and it covers an area of no less than 49,000 square miles. It seems to be a continuation northwards of Vaigach Island, from which it is separated by the Kara Strait, 30 miles wide. Even in summer large tracts of this extensive coast-line are frequently blocked with ice. On the east side even the mere outlines of the coast cannot be traced; and only in a very few places has the interior been penetrated. Apart from the travels to and fro of the Samoyedes, the journey of the Norwegian expedition across the North Island in the summer of 1921 is only the fourth which has ever been carried out in Novaja Semlja.

The Matochkin Shar does not constitute a

division between two tracts of country of different character; it is merely a cleft in the formation of the land—a deep channel resembling a Scandinavian fjord. In its vicinity the mountains rise to heights of from 3000 to 4500 feet. Already in the northern part of the thus-formed South Island glaciers begin to make their appearance, but they do not extend quite down to the sea. Not until the 74th degree of latitude is nearly reached is that the case, and then they increase in extent and dimensions to such a degree that they form an ice-cap over quite one-third of the North Island.

No original population exists on Novaja Semlja. The few Samoyedes who live there all the year round form four colonies, of which three are on the South Island. These people came from the district of Mezen at the entrance to the White Sea. The first of them were brought over at the expense of the Russian Government in 1870, and since then they have been joined by others from the mainland. The Karmakuli colony, on the west coast of the South Island, was the first that was organised. When in the summer of 1921 the Norwegian expedition visited the Matochkin Shar there were some twenty-five or thirty Samoyedes living at the western end of that strait; and the colony on the Krestovaja Fjord, on the North Island, consisted of only ten persons. These people have good houses, constructed of materials brought from Russia, and they live by hunting and fishing. Once a year a ship from Archangel brings them stores, for which they pay in furs.

The interior of Novaja Semlja is desolate in the extreme, and beyond an occasional bear, Arctic fox, or reindeer, there are few traces of animal life. There are not many insects, and even the mosquito of the tundras is absent. No reindeer were seen by the Norwegians on their recent visit, but plenty of their shed horns were found. This animal is not indigenous to Novaja Semlja, and it probably came there originally over the ice from Northern Russia. On the island of Vaigach the Samoyedes keep them.

Myriads of sea-fowl occupy the coast, and in summer vast flocks of swans, geese, and ducks visit the lakes, of which there are so many on the low-lying parts of the west coast, for breeding purposes. On their journey across the glacier-clad wastes of northern Novaja Semlja in 1921, the only bird which the Norwegians saw was the ivory gull (*Pogophila eburnea*).

There are not many varieties of fish in these regions: the most common, perhaps, is the char, which frequently attains a very considerable weight, and is captured in enormous quantities by the Samoyedes. It spends the greater part of the year in the sea, and ascends the water-systems for spawning purposes, as is the case in Northern Norway.

A GIPSY OF THE NORTH.

CHAPTER IV.—A PLAN OF ESCAPE.

'I GUESS yo' saw that little schooner down ther bay, when I was tryin' to mark you a while back, Mista Carwyke?'

'Yes,' answered Carwyke impatiently.

'Well, it's a little more nor three weeks since she sailed inter ther bay, which ain't a good one for ships, Mista Mannering havin' chose it for that very reason, as he didn't want ther whaling-crews about demoralising his people. Whalers ain't much class, as yo' may hev heard, an' as I know, havin' been one of 'em in my time. But to continue—when we saw thet schooner comin' in there was some excitement in this camp, as yo' can guess; an' I won't say what hopes ther sight of it awakened in Miss Norma's heart—'

'I thought that it might be my father returnin,' said the girl quietly.

'I guess we all had something o' ther sort in our noddles,' continued the narrator. 'I know I had, an' I fair prayed that we was right, for Miss Norma's sake. Before they'd dropped anchor an' lowered their boat, ther kayaks were out an' driving towards ther schooner; an' I guess thet I plied ther double-paddle as I hadn't done i' my life before. I won ther race to ther schooner, an' ther first face I saw was thet of thet villain Standifer. I spotted him at once for ther feller who'd passed through Unapik three years back; but I didn't connect him with ther black thing that had been done just then.

"Hev yo' got Mista Mannering aboard?" I yelled, though I guessed well enough thet he hadn't; for ther missionary ud ha' been on deck plain to be seen if he'd been there.

'Standifer looked at me like a feller who'd had a surprise. He could see I was white; an' I guess he wasn't expectin' thet, me not havin' spoken to him last time he was at Unapik, an' havin' missed his notice, or been mistook for a native. Then when he'd finished his stare he asks quite politely, "Who ther deuce are you?"

'I gave him ther information he wanted, an' then asked him my question again. He shook his head.

"Has Mannering gone, then?" he asks.

"Yes," says I; "lost on an ice-floe three springs back."

"Thet's damned bad news," he says, lookin' down at me as if I'd been a grub of a sort thet hadn't took his notice before. Then he lights a cigarette, jest to show how deep his grief was at ther news, I suppose, an' after a minute he asks, "An' Mannering's little girl—was she lost too?"

"No," I answers. "She's over there by ther tepees, prayin' thet yo've brought her

father back; but she ain't a li'l girl no longer, but jest a fine strappin' young lady."

'At thet he lets loose a laugh. "I was forgettin' how time goes," he says, then looks towards ther shore. "I'll come an' hev a talk with her, an' maybe I'll take her back to civilisation with me."

'All ther time he was parleyvooving with me, ther crew was gettin' out ther boat; an' when I saw him beginning to get inter it, I paddles back here to pass Miss Norma ther word thet her father wasn't on ther ship, an' to warn her thet Standifer was coming. I watched him land, saw him speak to Miss Norma here, an' then go into ther tepee; an' I reckon Miss Norma can tell yo' better than I can what he had to say.'

As he thus finished he looked at Miss Mannering, who, after standing thoughtful for a moment, took up the story.

'I did not like the man from the first; and when he spoke of my father's disappearance, like Billy, I felt he was insincere, and I had a conviction that he wasn't really surprised to find my father absent from the camp. He asked for particulars of my father's going, and I caught an odd look on his face when I told him that Billy suspected foul play; but I didn't think much of it at the time. The only comment he made upon the matter was one that I couldn't agree with at all.'

'What was it?' asked Carwyke quickly.

'He said the Eskimos were a treacherous lot, and he was surprised that something hadn't happened to my father before. I told him that I differed with him, and that the tribe loved my father—'

'An' thet was ther gospel truth!' interrupted Billy.

'He took no notice of what I said, but went on to point out that I myself was in a perilous position, among a wild tribe on a desolate coast which even the whalers passed by; and said that he thought I ought to leave the place and go back to my father's friends, and that he would break off his cruise and take me south to my own people out of harm's way.'

'Harm's way!' grunted Billy in scornful contempt.

'I answered that I didn't know who my father's friends were, and that the men and women of the tribe and Billy were the only friends that I had ever known; and at that he smiled.

"You must extend the list, Miss Norma," he said. "I claim the privilege of being counted among your friends. And it is because I am most truly your friend that I insist on your

living here. I will look after you until we find your relatives. You do not understand the danger you are in. One of those buck-Eskimos may fancy you for his wife and take you to his ship; or a drunken whaling crew may happen along and then——"

"He broke off there, and after a little pause resumed, "That would be too terrible! How terrible you can't know, and I dare not tell you. But you must not stay here; you must go south to the white people—and leave those blubber-eaters. It is nonsense to think that you can live your life up here—in grave danger, and among such a people. You simply must leave this miserable place, and if you can't find your friends, why, I myself will care for and cherish you!"

"When he said that he looked at me in a way that made me dislike him utterly, but I cut him off by saying that I would consider the matter, and with that he appeared to be content; and later in the day he invited me to go on and his ship.

"I had never been on a white man's ship, and I thought I should like to see one, though Billy had tried to dissuade me——"

"I suspected the beggar from the first," exclaimed Billy, "and I'd been on whalers which had put to sea with Eskimo women aboard in my time; an' havin' heard how he'd tried to persuade Missy to leave Unapik, I'd a notion of what he was after."

"I would not be dissuaded; and I went, with Billy and half-a-dozen of the men."

"We'd hardly boarded her, Mista Carwyke, when there was drink goin', an' before Miss Norma had made their tour of the schooner, most of the tribesmen was dancin' silly in the fore-cabin, with the sailors laughin' at 'em. I was sober, but by the mercy of God I kept off the whisky, though I'll own I was sore tempted; and all of a sudden I noticed that most of the tribes had left the fore-cabin, and that there were only two of them by the stairs, an' thet one of 'em had a sealing-rifle in his hands. Then I saw that there was trouble brewin'; an' when I heard the creak of a capstan an' the regular clump of feet, I guessed that the anchor was being hoisted. I made a move towards the fore-cabin, but the fellow with the rifle pointed it at me."

"Keep back, yo' damn Eskimo," he says, "or yo'll be an angel before yo' want to be."

"I knew now that we was fairly caught, an' I looked at the tribesmen singin'-drunk, an' wondered what would happen when they tumbled down that they were being carried out to sea to be dumped overboard, as like as not, as soon as we was out o' the bay. I could do nothing. The feller with the gun knew it, an' he grinned at me; an' when the ship began to move I reckoned it was all up with us. . . . But to cut the yarn, it wasn't!"

"A goodish bit later, Standifer himself comes to the top of the ladder, shoutin', "Where's thet damned squaw-man!"

"Here!" says the fellow with the rifle, who was sitting on the steps, smoking.

"Is he drunk?"

"No; sober as a water-wagoner!"

"Then pass him along, quick."

"I was passed up the stairs, an' when I reached the deck I sized up the trouble at once. A Bering fog had blown up, an' yo' couldn't see one end of the schooner from the other."

"Look here, fellow," says Standifer, "I guess yo' know these seas an' coasts, an' yo're a sailor-man though yo' have chosen to live with these dirty blubber-eaters. We've lost our bearings, an' we're too close to the mud for my liking. You've got to pilot us out. Can yo' do it?"

"Well," says I, "I ain't a navigator, but I knows this coast——"

"Then get her out," he shouted, "quick! This fog is thet deuce."

"The fog was thick—a regular Bering blanket; an' the wind was drivin' it jest like rain. It wet a man thro' jest as if it was rain; an' the ship was drippin' an' drivin' to thet Lord-knows-where in a freshening wind. North he was goin' now, though I'll take me oath she'd started south; but Standifer had got scared between the fog and the shallowness of the sea, which up here ain't much deeper than a duck pond; an' in his anxiety to get open water, I reckon he'd changed his course more than once."

"I'll try," says I, "but I don't guarantee——"

"You'd best try hard," snaps Standifer, "or yo'll be fish-meat in no time at all, an'—— What thet livin' blazes is thet!"

"The sound of a shot had broke right on his words, an' thet next moment there was a bellowing sound from thet fore-cabin companion, an' I knew thet thet tribesmen was making trouble. Standifer knew it too, an' with a curse he rushed ter take a hand in the racket. At thet same moment I saw Miss Norma here, standing a little away. I went to her, an' she whispers ter me, "Billy, we're in Unapik Bay. The fog broke a minute ago, an' I saw the camp."

"Thet so!" says I, knowing then thet Providence was fightin' for us; "then get ready, an' go over thet side if we bump."

"I went towards thet wheelman. The wind was fair behind us, an' we was making a good pace through the fog. The leadman was calling the depth; an' I grinned to myself as I listened to the racket down in the fore-cabin."

"Then jest as if yo'd ripped a blanket in two thet fog parted, an' lyin' clear in thet

sunshine was ther long spit where ther schooner lies. We was close to it, with ther wind an' tide behind us, an' nothin' in this world could save us from striking. Ther helmsman let out a yell, as did ther watch in ther bows, but I guess Standifer was too busy in ther fo'c'sle to hear it; an' as ther fog began to close up again, I ran back to Miss Norma. I hadn't time to speak to her, when the ship struck, knocking both of us off our feet; but I was up in a trice, an' gripping her.

"Quick," I says. "Overboard. We'll win clear of these ruffians yet."

'I heard Standifer yelling an' cursin' as we hit ther water, an' began to swim quietly away in ther fog. We hadn't so very far to go, thank God, an' when we landed ther tribesmen who'd seen ther schooner comin' in were already runnin' down ther beach.

'It didn't take long to tell what had happened, an' when they knew they went fightin' mad, an' there was no stopping 'em. That's one o' ther queer things about Eskimos. They're a quiet, peaceable lot in ordinary, an' don't go lookin' for trouble anyways; but when ther blood is hot, then look out! . . . I guess before that night was over Standifer learned somethin' as he hadn't known about blubber-eaters,' he added meditatively.

'They attacked the crew?' asked Carwyke quickly.

'At close quarters, an' seal-harpoons is pretty nasty weapons to run against. Ther little lot over ther tundra there is all that won clear, except two that I've picked up since; but we've lost six hunters an' one woman, an' things ain't what you'd call rosy, for it's plain they mean to have Miss Norma here, if they hang on all summer. Ther Standifer is a stickler, an' why he wants Miss Norma I can't make out; but he does want her badly. A week back he caught one of ther kids what had strayed out on ther tundra, an' he sent a written message to me, offerin' to go away in a boat they've got down ther coast somewhere if I'd give up ther girl; an' because things are gettin' pretty hot, Miss Norma here was inclined to agree to save ther tribesmen, but I wouldn't let her.'

'I should think not!' said Carwyke with conviction.

'But the position is very bad,' broke in the girl. 'No one can move out of the camp but at the risk of being shot, and the children are in danger. We've only three rifles, and Billy is the only marksman.'

'But you can move the camp,' said Carwyke.

'Not very well! On sea or land we are exposed to ther fire unless fog comes, and for a week it has been as clear as it is now. And I can't bear the thought of these innocent people suffering for me, when I can save them by marrying that man Stand—'

'Marrying?' ejaculated Carwyke.

'Yes!' answered the girl simply; 'that is what he wants. He told me so when we were on the ship and sailing out of the bay.'

'Phew!' Carwyke whistled, and then looked at the girl before him. That she was eminently desirable his own eyes told him. Many men meeting her would wish to mate with her, for she was virginal and glorious; but that Standifer was so moved he did not believe. The scrap of conversation that he had overheard in the tent assured him that there was some other reason for Standifer's purpose of marrying her; but what that reason was he could not guess even remotely. He was still thinking, when the girl spoke again.

'I would save these poor people for whom my father worked by—'

'You must not think of it!' broke in Carwyke earnestly. 'There is something behind all this that we none of us know—I am sure of that!'

'But if we continue as we are——' began the girl, and broke off without finishing the sentence.

'There is no need for you to do so,' answered Carwyke after a minute. 'If you were to leave the camp, those men would follow, and your friends would be saved from further molestation, Miss Norma.'

'You think so?' asked the girl quickly.

'I am convinced of it,' was the answer emphatically given. 'Suppose Billy and I talk it over; we may hit on some plan.'

'If you only could!' said the girl a little wistfully. 'The present position is intolerable. Always one of these men is on the watch. If our hunters go out on the sea after seal they are shot at. If they go out on the tundra it is the same; and soon the camp will be starving—in the season of plenty! And there is not much ammunition for the rifles left.'

'Then Billy and I will discuss a way. Rest your mind, Miss Norma, we will find a way.'

Carwyke turned and, accompanied by the other man, left the tent. As they emerged and stood for a moment the whizz of a bullet sounded, and from far away came the faint crack of a rifle. Eskimo Billy swore, and dived for the tepee nearest the one they had just quitted, and Carwyke followed him.

'That's ther sort of thing when these devils are on ther rampage. They've got glasses, an' they watch ther camp like a fox watches a sitting ptarmigan before it springs. This camp ain't what yo'd call a sanatorium jest now——' He broke off, spat meditatively, and then looked shrewdly at his companion. 'What's yo'r plan, Mista Carwyke? Yo've got one, I know, for I saw it in yo'r eyes back there in Miss Norma's tepee.'

Carwyke's answer was a question. 'Billy, are you tied to this camp, yourself?'

'Well, not what yo'd call tied—not now! When I hit Unapik, Mista Carwyke, I was moving on, but I stayed—for a girl. Mista Mannerling was against her having me; but when he saw I meant it, he tied me to Teriksin jest as fast as law an' church knew how; an' we sorta lived happy ever after till that blasted Russian came along when I was out with ther hunters, an' stole her away. By Heaven!'—he broke off, and his placid face was convulsed with sudden almost maniacal fury—'if ever I come up with him!' For a moment he did not speak again, but the working of his face showed the stress of his emotion, and when he broke the silence his voice was hoarse and shaking. 'Four years I've waited and watched, with never a sign of him or Teriksin. I should have moved on afore this, but for ther one hope o' meetin' him. An' I'll move on now to save Miss Norma from that eagle-faced scoundrel across ther tundra there. Maybe a move will bring me on ther Russian's trail, an' if it does, then ther devil help him, for I know God won't!' Again after this outburst he was silent, and when a minute had passed and it was evident

that the man's emotion had spent itself, without referring to the cause of it, Carwyke resumed.

'You and I might get her away! It might be possible for us to work across the tundra towards the hills, and so to other white men. If we could get a start, and leave those scoundrels behind, we might save both Norma and the tribesmen; for, once they found out that the girl had gone, they wouldn't waste time here, but would quit, either on our trail, or for the south. Standifer is not such a fool as to wait for winter to overtake him on the open tundra.'

Billy thought a moment, then nodded his head. 'It might be done if we could jest persuade Miss Norma. Yo' see, farther up ther coast there's a river empties which is bigger than most streams what yo' find in ther tundra, having a better drainage. I don't know where it comes from, Mista Carwyke, but I know it runs a long way, and if we was to follow it, we'd maybe get at the back of them beggars over there. Then we'd have clear running.'

'Is it navigable?' asked Carwyke eagerly.

'Well, it ud take a kayak a goodish way, I reckon.'

OCEAN VOYAGES IN SMALL CRAFT.

By FRANCIS B. COOKE.

THE challenge issued by the Duke of Leinster to Mr Nutting to race across the Atlantic single-handed in small yachts not unnaturally attracted a good deal of attention, for it is no small undertaking to traverse some three thousand miles of open ocean in a little boat. The Atlantic crossing has, of course, often been made before in small craft, but there is no record of anything in the nature of a race having been attempted in vessels sailed single-handed. And cruising and racing are very different propositions, for whilst in the former the voyager can proceed in leisurely fashion, taking precautions for the security of his vessel when signs of approaching bad weather are noticed, in the latter he must carry on until the safety of his craft is actually menaced.

Although the Atlantic has been crossed by little boats on quite a number of occasions, the objective has usually been purely commercial, and the voyages made by amateur yachtsmen could almost be counted on the fingers of one hand. The redoubtable Captain Andrews made several crossings years ago, the first, I think, being in the fifteen-feet *Red, White, and Blue*, which was subsequently on view at one of the great London exhibitions about forty years ago. This same Captain Andrews lost his life in 1901 whilst on a honeymoon trip from the States to England

in the twenty-feet *Dark Secret*. What happened to the little ship will never be known, as after her departure she was not seen again. A more fortunate honeymoon was that of a Mr Bradley, who, in 1902, brought his bride from Nova Scotia to Dover in a boat measuring only sixteen feet in length. Another woman who braved the perils of the Atlantic was the wife of Thomas Crapo, who accompanied her husband in a little boat named *New Bedford*. More surprising, perhaps, than the successful accomplishment of the voyages was the sublime faith of the wives in the skill of their husbands, for they seemed to reckon little of the danger and discomfort. Probably the longest voyage of this nature ever undertaken by a woman was that of the wife of the late Captain Joshua Slocum, of *Spray* fame, who accompanied her husband and two sons in a small open boat from the coast of Brazil to Philadelphia, a distance of seven thousand miles.

Some of the most notable small boat voyages, however, were made in waters other than the Atlantic. The fishing smack *Forget-Me-Not*, for instance, made a remarkable passage to Cape Town in 1908. She was manned by four young men, of whom only one had had any previous experience of the sea, and proceeding by way of Madeira, Las Palmas, Cape

Verde Islands, Trinidad, Tristan da Cunha, Nightingale and Gough Islands, arrived safely at Cape Town, having covered some ten thousand miles of open sea. An even longer journey was made by the *Storm King*, a patent lifeboat, in 1889. Carrying a crew of four, the vessel sailed from London and, proceeding *vid* the Cape, eventually reached Adelaide after a passage of 326 days.

The two greatest exploits in the way of long single-handed voyages were those of Captain Slocum in the *Spray*, and Captain Voss in *Tilikum*. Both sailed round the world, the former covering forty-six thousand miles, and the latter about forty thousand miles. *Spray* was a vessel of about thirty tons, and her owner was able to live on board with some degree of comfort. She possessed an extraordinary facility for sailing herself with the helm lashed, and at one period of the voyage, when in the Indian Ocean, Captain Slocum did not touch the wheel for weeks on end. Although very heavily built, *Spray* was capable of attaining a speed of eight or nine miles per hour, and, being a particularly fine sea-boat, was able to take care of herself in heavy weather.

Captain Voss's craft was of very different type, being an old dug-out canoe, originally built by Alaskan Indians for war purposes. She was about thirty feet long with a beam of five feet, and, even after Captain Voss had added a false keel, drew barely two feet of water. In preparation for her long voyage the boat was decked all over and fitted with a tiny cabin, in which Captain Voss subsequently lived for four years. Rigged as a three-masted fore-and-aft schooner, *Tilikum* was surely the strangest-looking craft that ever sailed the Seven Seas. Nevertheless she lived through sixteen great storms, and although she at times encountered seas forty feet high, she never shipped so much as a bucketful of water. In referring to Captain Voss's venture as a single-handed voyage, I am not perhaps strictly accurate, as at the outset he was accompanied by a man named Begent. Whilst in the Southern Pacific, however, the latter unfortunately fell overboard and was drowned. For the remainder of the long voyage Captain Voss sailed quite alone.

The voyages to which I have referred were for the most part undertaken for the sake of gain, either by exhibiting the boat on arrival at her destination or for some other commercial purpose. Captain Voss's objective, for example, was the advertisement of a new form of drogue, or sea-anchor, which he had invented, and it was with a special view to calling attention to its efficiency that he selected such an unpromising type of craft as *Tilikum*. Several Atlantic voyages, however, have been undertaken with no other inducement than a thirst for adventure. Mr Nutting, whom the Duke

of Leinster challenged, had already made two successful trips in small craft; and quite recently Mr S. C. Houghton, of the Royal Corinthian Yacht Club, sailed the small racing yacht *Neith* from America to England with an amateur crew. Another notable amateur voyage was that of Mr Thomas Fleming Day, the well-known American yachting journalist, who some twenty years ago sailed the five-ton barge yacht *Sea Bird* from the States to Rome.

Although Captain Andrews, Captain Blackburn, and possibly one or two others have lost their lives in attempting the Atlantic crossing in little boats, so many have successfully accomplished the feat that one is forced to the conclusion that it is not so perilous as is generally supposed. It is not the size of the waves so much as their character that renders them dangerous, for, provided that they do not break, they are comparatively harmless. Indeed, a little boat will often make far better weather of it than a large vessel, as her short length enables her to lie comfortably upon the side of a sea through which a big ship would have to plunge. The seas in mid-ocean seldom, if ever, break, and as a rule it is only when the influence of an abnormal tidal current is felt, or there is a sudden change in the depth of the water, that the waves assume a dangerous aspect.

Every boat has a maximum speed beyond which it is impossible to force her with safety. If pressed after that speed has been attained, she commences to make waves on her own account. These artificial waves, in conflict with the natural seas, result in broken water, and the prudent mariner, when running before a following sea, shortens canvas in order to reduce the speed of his vessel. But in a gale of wind a boat under the merest rag of sail will travel too fast for safety, and in such circumstances she has no alternative but to lie-to. She can either be hove-to under a close-reefed mainsail or try-sail, with her fore-sail a-back, or ride to a sea-anchor. Now, in a very small craft it is not advisable to heave-to, as the reefed sails would be becalmed in the trough of the seas, and the vessel might pay off broadside on and be overwhelmed. It is the usual practice, therefore, for a small boat to ride to a sea-anchor when caught out in a gale of wind.

The sea-anchor, or drogue, is the small boat's salvation when making an ocean voyage, and no prudent sailor would embark upon such an undertaking without one. Briefly described, a drogue is a canvas bag, conical in shape, and sewn to an iron hoop, to which is attached, by means of a bridle, a stout warp. The drogue is prevented from sinking too far below the surface by a small cork buoy secured to the iron hoop with a few feet of line. When overtaken by heavy weather, the boat is brought to the wind and the drogue lowered over the bow, some fifteen fathoms of riding warp being paid out.

The effect is to keep her riding head on to wind and sea, in which position she will not ship anything but spray, and requires no attention, the crew being able to seek the comparative comfort of the cabin. Equipped with an efficient drogue, a small boat should be able to live through practically any weather, and it is undoubtedly due to this ingenious contrivance that little boats are able to cross wide tracks of the ocean in safety.

The most dangerous stage of an ocean voyage in a small boat is when she reaches soundings, for in shoal water the seas are apt to become steep and breaking. If a boat is overtaken by bad weather when approaching the land, there may not be sufficient sea-room to permit of the use of the drogue, as a craft riding to a sea-anchor makes considerable drift. But even in these circumstances the drogue can be of great assistance, if used in another way. In running

for a harbour before a dangerous sea, the drogue is towed apex first by the tripping line, in which position it retards the vessel's progress but little. When a threatening sea is observed, the tripping line is slackened sufficiently to allow the drogue to turn over and come into action. The vessel's speed is at once checked, whilst the strain on the warp, which is of course made fast to the stern of the boat, prevents her from broaching to, and the wave passes harmlessly beneath her. As soon as the dangerous sea has passed, the drogue is tripped again. Skilfully handled in this manner, even open boats have lived through the wildest seas. Whilst in New Zealand Captain Voss crossed the famous Sumner Bar six consecutive times in an open boat, using his patent drogue, without shipping any water, to the astonishment of some seven thousand people who had assembled to witness the demonstration.

'FACILIS DESCENSUS.'

PART II.

III.

IN the October of the third winter there occurred an event so insignificant as to be hardly worthy of record. It was, in fact, nothing more than a passing sensation—a smell.

It had rained for a fortnight. In that fortnight Firkins had thrice revoked, the roof over the servants' bedrooms had leaked, and Mrs. French, the cook, had contracted a sore throat. William Anstruther Parkes was returning from the scene of the third and most criminal revoke. He was walking up the hill in the dark, when, through the open door of a cottage, he caught a glimpse of a laden dresser, a red-tiled floor, a picture of a white cow, and a woman with untidy hair pursuing a cat with a duster. There was a glow within, making every raindrop momentarily golden.

It was a comfortable experience—precisely the sort of experience he had so often thought of in India as approaching the ideal. A rainy night, and the warm benison of a cottage fire on the way home—the very picture he had so often conjured up. Yet the effect of the experience, when it came, was unexpected and disturbing. For he did not look. He sniffed; and each sniff seemed to bring a whole world of images. First the bazaar at dusk, with a hundred little things leaping out; then, camp at night; then, the servants cooking their dinners; then, the faces of the servants in the flickering light—old Madar Bax, the bearers, and that admirable jemadar; then, the tents and the dim, swaying forms of the elephants under the trees. Thence his imagination took wings and rioted, for he saw the morrow's tiger-beat, the sun on the

jungle, the long files of beaters, the great, striped body stretched on the grass. The tension and the ecstasy came back to him—good days! Something like a pang shot through him, and he had to pull himself up mentally as well as physically. He looked resolutely at the cottage, as if determined to appreciate the present at all costs. Then, feeling the rain creep into his boots and down his neck, he stumped on up the road.

He had only caught a whiff of a damp peat-fire. Only a damp peat-fire—but after dinner that night, when he had got his pipe going, he laid down his 'Poor Law Administration, with schedules and appendices,' and took from an obscure bottom shelf another volume, whose corners were peeping from the frayed linen like heels from torn stockings. It was labelled 'Shooting Register, India.' As he opened it he looked round almost furtively. But he did not close it till midnight.

In the morning he regarded the whole affair of the peat-fire as a regrettable lapse, somewhat excused by its utter unexpectedness. He made up his mind that it should not happen again, and, as if to pin down the temptation, wrote 'No regrets' with a flourish in his diary after breakfast. Then he departed to London to see his dentist. On the way up in the train he carefully and systematically took his mind back again, as it were, over the course of reminiscence, furnishing that course with its appropriate obstacles—the smell of the bazaar by day for instance, camp-cooking, flies, and a go of malaria. Old Madar Bax, he recalled conscientiously, had been an unmitigated thief, and the admirable jemadar laziness personified. The tiger-skin

had been stolen subsequently—and was not that fact in itself a sidelight on the whole character of India?

'The land of unfulfilled promise' he would call it—the land which held tigers and hill-stations and C.L.E.'s as baits for the unwary, and then, by some secret alchemy, substituted hot weathers and famine, duty and obscure graves. Whereas in England—you knew where you were.

He looked out of the carriage-window, and marked the orderly fields and hedges and houses—the gates—the notice-boards. Yes, you knew where you were. You could believe what you saw. Firm ground!

Three-quarters of an hour later, as if to give him the lie direct, the maid informed him that the dentist was out of town. Vain to show the appointment card. Vain to recall the succession of past visits, and to expatiate on the sacredness of a dentist's ties with his patients. He was out of town. She blushed. She was sorry. There had been some mistake, but—he was out of town. Muttering '*Be-bandobast!*' (feckless), William Anstruther Parkes descended the steps. As he made his way to the Tube there came into his mind another scene—the picture of an excellent dentist walking up the steps of his own bungalow at Fatehgarh a quarter of an hour before the time of the appointment. Ah, then he had been some one! With a gesture of petulance he switched his mind off the forbidden topic.

But he seemed to be fated to be reminded of India at every turn, for at Brompton Road an Indian boarded the train and took the place next to him—a handsome young man in a gray suit and a becoming purple pugaree. With a certain thrill of satisfaction at his own unimpaired powers of observation, he recognised the type—a Punjabi officer; very likely one of the four on special duty at Buckingham Palace. The mere proximity of the man fluttered him strangely. He could not help stealing glances at him, for the Indian recalled pleasant things—polo meetings, a visit to a rajah for duck-shooting, sundry bright ceremonials—and at the same time made the other passengers look dull and sombre. It passed through his mind that colour was what England lacked.

Then came an astounding thing. Quite naturally, and without a shadow of hesitation, the Punjabi turned to him, made a gesture of respect, and asked for the nearest station to Grosvenor Gardens. But he asked in Hindustani! In Hindustani—and without a shadow of hesitation, as if he were certain of his man.

William Anstruther Parkes answered in Hindustani, and the words came back to him pleasurably, as if he had been long in a foreign land and had been debarred from using his own tongue.

'*Mirhbani*, sahib'—another courteous gesture. Courtesy! That was what England lacked. He could not help comparing the easy grace, the subtly conveyed respect of that salute, with the clumsy plucking of the cap which stood for homage in England. He brightened. He forgot the dentist. He drew himself up and asked questions. Soon he was carrying on an animated conversation.

'How did you know that I should understand Hindustani?' he asked.

A deprecating wave of the hand. 'How should I not know, sahib! There was something—'

Yes. Exactly. There *was*—something. An air—a stamp. He had been some one. And this man knew.

He glanced round and noticed that other passengers were regarding him with a sort of furtive curiosity not unmingled with respect. They, too, were fluttering and whispering, and one woman was holding up her little boy to look at him. Almost in spite of himself he raised his voice and began talking about Lahore—the races—the Patiala polo team—the Durbar.

How it all came back! Even when, after a cordial handshake and exchange of salutations, his new acquaintance alighted, the sense of satisfaction did not desert him. It resembled the feeling that succeeds a good dinner—a warm glow of kindness. When he, too, alighted at Piccadilly Circus, eyes followed him. The conductor touched his cap. It was only when he had given up his ticket and quitted the station that he recollected his umbrella. He had been so overcome with emotion that he had left it behind in the train—and the rain was coming down in sheets. Piccadilly glistened with umbrellas.

He stood for a moment in the station entrance, undecided. Once more his thoughts were stealing to the land of rainless winter, and this time he did not switch them off, but let them light on a picture—duck strung out in a wedge pattern against a cloudless sky. In December, too! And he and Carslake had bagged forty couple.

'You'll miss this sort of weather in England, my boy,' Carslake had said. Well, Carslake was in the same boat!

Suddenly an idea struck him—why not look Carslake up? He had a couple of hours to spare, and he would be out of the rain. Without a thought of the implications of his present mental condition, without a backward glance at the dangerous currents that led to it, innocent of any presage of doom, but desiring only an old friend, and a fire, and a 'buck' about India, he hurried down Jermyn Street, bore to the left, and saw the puddles reflecting the street lamps in St James's Square. He fumbled in his pocket for his card-case.

IV.

Sir Rawdon Carslake was in, the porter thought, basing his estimate on innumerable particular instances of Sir Rawdon being 'in' at that hour. A page departed to verify the statement, and William Anstruther Parkes sat down.

There was a comfortable, glowing look about the interior. Members—many of them known to him—passed to and fro, looking animated and happy. Serried ranks of antlers and horns on the walls reminded him of other antlers and other horns that should have been in the hall—but were in the attics—at the 'Gables.' A momentary discontent with the 'Gables' passed over him. The house was on the small side. Now, in an Indian bungalow, with all its disadvantages—

'Sir Rawdon is in, sir, and will you kindly step this way!' He went inside.

When, four hours later, having dined and borrowed an umbrella, he saw once more the street lamps reflected in the puddles of St James's Square, his feelings were curiously and rather alarmingly mixed.

He had thoroughly enjoyed himself. But the devil of it was that he had not spent such an enjoyable evening for—well, two years. But, even more forcibly, the devil of it was that that enjoyment had taken place at the Bandobast Club. It was illicit enjoyment!

Yet, that dinner! How it had shown up Mrs Wrench! That sauce with the sole—a smack of India there. Byculla soufflé—they knew a thing or two. And the wine—admirable; the exact temperature of the room. Mrs Wrench would have boiled it.

Then, again, those rubbers—all old friends; and he had not lost the art. Rather the contrary. That was the devil of Pilchester—no possibility of bridge without Firkins. Firkins! Funny thing—he had played in that very four at Fyzabad all through the hot weather of '99. Come to think of it, there were points even about the hot weather. You knew where you were, at any rate. Heat never did a man any harm so long as he didn't play the giddy goat.

They had been really glad to see him. He had had quite a little ovation. 'Good old Struther!' Very gratifying; unexpectedly gratifying. Whereas in Pilchester, who cared? Who really cared? And, after all, why should any care? What had he in common with Firkins, a parson who had never been out of England; and Ling, a retired stockbroker, who thought that Bombay was the capital of India? Excellent fellows in their way, but a man who had served abroad and seen something of the Empire naturally looked at things a little differently—a little more broadly—

What was the word that Carslake had used? Ah—'parochial.' 'Narrow and parochial'—'wasting yourself.' Well, he certainly ought to be chairman of the guardians. Ling was no good—too hide-bound altogether. But Carslake was on the Indian Council—and who, after all, was old Carslake? He could still tell Carslake a thing or two about running a district.

Yes, he had thoroughly enjoyed himself. It would be absurd to deny the advantages of the club. He had been unreasonable about it—unfair, almost. Very good of Carslake to offer to put him up for it. He could hardly have done otherwise than accept.

'No difficulty at all, my dear fellow.' Exactly. No difficulty at all. And yet, for that second-rate, gimcrack, county affair—

It was, in fact, only the following morning that a belated twinge of conscience made itself felt. There, in black and white, at the beginning of his diary—'Nothing will persuade me to join the Bandobast Club!' A principle, if ever there was one. And he had sacrificed it.

He started at the words. Should he, after all, drop Carslake a line and call it off? Quite easy—but, after all, he had a right to change his mind. To change one's mind could be, under certain circumstances, an act of courage. It was precisely the inability to change his mind that made Ling such an impossible fellow to work with. Besides, he would only go there once in a blue moon—a country member.

A country member! There was an element of compromise there. It enabled him, without a backward glance, to cut out a neat strip of paper and paste it over the abandoned principle. With a little sigh, which might have been relief or regret, he removed the embargo from the Bandobast Club.

His election, since Carslake was a member of the committee, went through remarkably quickly. Within a week he was ordering a fresh die for his visiting-cards.

The rain continued. The situation as regards the roof of the servants' bedrooms became critical, and Ling became, and remained, singularly obtuse over responsibility for repairs. In fact, Ling obstinately refused to change his mind under any circumstances whatever; and Firkins, in taking his part, proved himself the narrow-minded prig he had always seemed to be. Meanwhile Mrs Wrench's sore throat became steadily worse, necessitating a period in hospital; and her substitute imported an aroma of beer into the kitchen, and of onions into the puddings.

There was no pleasure in going out of doors, so he turned in desperation to a task which he had long delayed—the sorting of his Indian cases in the lumber-room. It gave a surprising amount of pleasure, since nearly everything he fingered had a little history. A brass kettle here, picked up for nothing in Benares bazaar before the days of machine-made counterfeits

and sharp-nosed American tourists; here a Tibetan necklace, bought from a Bhutia—solid chunks of amber and turquoise; here a flask, a good old friend. Then the skins and the heads; no room for them on the walls, but it was good to run an eye over them again. Books, too, and photographs, bringing back flavours of the past. Good times! Led on insensibly, he made a job of it. He sorted his camp kit, and cleaned up his rifles.

Whenever he looked out of the window he saw rain; and whenever he saw rain, he thought of the unclouded winter sky in the Terai. He yearned to run up to the club and discuss that unclouded sky and all that happened under it. But that he resisted. It involved an even more fundamental principle than the other. Hanker for India? He might as well get married and be done with it!

Then, after a vestry meeting, he happened to overhear an ill-judged remark. Plintock, the doctor, in a would-be whisper, referred to him as 'Our somewhat pompous neighbour from Bengal.' And over again he repeated the words to himself as he walked home. They hurt him. Every syllable of them hurt him—but especially the two syllables of 'Bengal.' For he had not served in Bengal. He had always rather looked down on Bengal methods. Very good fellows, no doubt, but the cream of the Service—no.

'Pompous,' too. So he appeared pompous, did he, to Plintock. And who *was* Plintock? And if Plintock was anybody, would he be the local sawbones at a one-horse, parochial little place like Pilchester? Why, even Mrs Wrench's throat had baffled him completely. Plintock!

He hated Plintock. Worse—he hated Pilchester. Pilchester and Plintock seemed suddenly indissoluble. He could no longer remain in the same place as Plintock—and Ling, for that matter—and Firkins.

He packed a portmanteau, wired for a room at the club, and took the early train to London. He was made welcome. Before the first evening was over Plintock and Pilchester seemed very distant, very petty. He could afford to smile at them. But neither he nor his friends could afford to smile at the rain, which had fallen monotonously for three weeks, and was still falling. It turned their eyes in a dangerous direction. It made them thirsty for reminiscence.

So he no longer toyed with India, fingering it, so to speak, as he had fingered the mementoes in the lumber-room. He steeped himself in it, and they all joined him in the pleasant waters. Before dinner he was not perhaps wholly abandoned—that is to say, he still had some defence to make for the amenities of England. But after dinner he was lost. There was no escape. For, if the others were seasoned bibbers, well used to the fumes of the heady vintage of reminiscence, to him it was a new experience.

It went to his head. He became extravagant in his eulogies of the Indian climate; so extravagant that, when Carslake suggested a three months' trip to Nepal as the solution of all his problems, he could not consistently draw back. He made an attempt at temporising, it is true, but it only called forth the reminder that he had no ties.

'Lucky man, you have no ties!' The words crept over him like a slow, insidious poison. Carslake was a married man, and yet he was going. But he—he had no ties. Lucky!

He accepted. Thus it came about that once more, in a P. & O. cabin, William Anstruther Parkes watched another diary disappear through a porthole—not only another diary, but another principle!

V.

On a warm hillside in Kumaon, surrounded by neat apple-orchards and overlooking a green dell, where runs a river, stands a roomy bungalow, its halls thronged with the antlers and the heads which had been too much for the hall at the 'Gables.' The senile Madar Bax and the admirable jemadar adorn its verandas. The owner is William Anstruther Parkes, late of His Majesty's Indian Civil Service, now an honorary magistrate and a lieutenant-colonel in the Kumaon Volunteers. On an estate where every tree is numbered and every apple earmarked for its ultimate destination he has plenty to do. But sometimes, on an evening, he takes an hour off, and casts a yellow spider over the pool below the bungalow. Sometimes then he hears a cuckoo call in the glen. At that sound Pilchester instantly comes back to him, and, instead of the imperious Himalayan stream hurrying to the plains, he sees the sluggish Pil meandering through water-meadows to a spinney where also a cuckoo called. His fatal habit of seeing what is not there by preference to what is has engaged him stoutly, for he lays down his rod and sits down on a rock. Soon he sighs.

He is reflecting that India is not what it was. Even garden coolies are expensive to keep and difficult to control—thanks to Gandhi and Company. Government has botched the reforms. The cost of living has gone up. There is no one to play bridge. Whereas in Pilchester—

'Gad, we must be off!' he says to himself, as he climbs the hill towards the house. He has said it for over four years. But it is hardly likely that Mrs Anstruther Parkes, whom he first met on the way out, and whose enthusiasm for India caused him to settle down there, will ever pay the smallest attention to what she describes as 'one of William's whims.'

So the chances are that he will even be buried there.

THE END.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

LESS sentiment is exercised at the beginning of a new year in the times in which we live and strive than was ten years ago, for now it happens for good reason that while so many are relieved at the ending of one period of twelve months, which in a wide-world sense was associated with much that was unhappy and bad, they regard with apprehension its successor, not being satisfied that the auguries point to any improvement. Certainly there are people in plenty who achieve contentment and even happiness, delighting in material possessions and a capacity for indifference to large issues. They combine some of their materialism with a little fatalism, and the result is a curious tranquillity of a narrow kind. But in general, while the world is seething and the problems of life become increasingly difficult, there are repercussions upon the units, the old sense of security and of the value of effort has departed, and men and women no longer face a new year with their former eagerness, because there is a half-developed feeling that the best efforts may be turned to failure through the obtuseness of governments. Besides, after sad experiences, the people begin to regard these old festivals, celebrations, and markings of time in a new and more careless way. Is not a year a period of less consequence than once it seemed to be, now that we devote so much thought and study to the succession of whole civilisations, to primitive origins and ultimate destinies? Desperate experiences, harsh circumstances, a certain morbidity, and a keen tendency to speculation upon future destinies made a change in the attitude towards these fleeting registrations. The thoughts of our grandfathers did not often carry them farther back than two or three thousand years. Ancient Egypt once seemed away on the far horizon of distant time. In schools children began their serious education in English history with the grand exploit of William the Conqueror, and though it was understood that something had happened earlier, supported by glimpses of Roman history, in which the adventures of Cæsar were noted, tales of the Phœnicians, and the like, the general faith in fact did not appear to go back beyond a time having tangible hooks with our own age. The

truth of that tremendous line, 'A thousand ages in Thy sight . . .,' which should turn every church and chapel worshipper who thinks of it into a better philosopher than before, is more appreciated than it used to be.

* * *

It is not made easier for certain sensitive minds to play lightly with conjectures upon this opening year through the fact that recently some graves reckoned to be fifteen thousand years old, containing well-preserved skeletons of three prehistoric human beings, were discovered at Solutr , a village in the department of the C te-d'Or, near Macon, that has become somewhat famous for its prehistoric remains. For sixty years or more finds have been made on a rocky slope jutting out above the village, among them chiefly the bones of multitudinous horses upon which the prehistoric tribes of those parts fed themselves. The Lyons Faculty of Science determined to undertake a methodical search of the district in the hope that something even more interesting and important than the skeletons of these long-departed horses might be found, and in three weeks the investigators came upon three skeletons, two of men and one of a woman, buried at depths of three feet seven inches, five feet, and six feet from the surface. They were plainly the bones of human beings, in excellent preservation, and showing every sign of careful burial. One skull was intact; the trunk and limbs of another were in perfect state. These creatures in their time seem to have been very strong, for the smallest measured six feet two, and the tallest seven inches more. The skulls are of somewhat remarkable shape, oval with low foreheads, large, square eye-sockets, and big jaws holding teeth that are still good. The bodies were laid in their graves on their backs, resting on beds of ashes, the faces turned eastwards to the sun, and two roughly shaped stones were set vertically over the head of each skeleton. The anthropologists have conducted their investigations and made their deductions, concluding that our long-departed brethren belonged to the widespread Cro-Magnon race, which is said to have been ethnically connected with the great horse hunters of the valley of the Sa ne, and the troglodytes of the V z re and of the Mediterranean coast at Mentone. There seems,

from the details of the finding, to have been some order in the lives of those persons of the palæolithic period of fifteen thousand years ago to which they belonged. They had superiority over all other men and species about them, and doubtless, having no conception, even by the utmost straining of their intellects and imaginations, of the further possibilities of man as we, our noble selves, have achieved them—our wireless and our submarines, our telephones and our poison-gas—they must have considered themselves civilised, perhaps even the highest possible products of mankind. A certain equanimity, leading on to self-satisfaction and then to doubts, must have possessed them. They may, in prideful regard for their own perfection, have wondered what must follow next, and feared it might be catastrophe. In those days necessary information was conveyed from one individual or community to another by signs on wood and stone, and these were the limits of non-oral circulation of intelligence, and the Cro-Magnons rejoiced—or would have done if by so doing they had not been party to our anachronism—in not possessing newspapers to scare them every morning, and perchance on some occasion reduce the sense of their own importance by reporting the discovery of bones that carried the tale of human life back for other fifteen thousand years. These last fifteen thousand years seem not so far from us as once they did. When a poor man becomes a millionaire he may exclaim contemptuously, 'What is ten thousand pounds!' and so when people have been looking into eternity, fifteen or twenty thousand years is but a trifle after all, and a single year, alas! the tiny dot whose inception is celebrated now is to long, unending time little more than a pin-point to space unlimited. Consider how closely the Cro-Magnons belong to us. A flint spear-head was found stuck fast in the skull of one of the skeletons, telling plainly that he and his kind, poor fellows, were afflicted with the same sad practice as ourselves. He had been a warrior killed in battle. He had, perhaps, been brought to think that war was a splendid thing in itself, and indeed, deprived of machinery and chemicals, untouched by science, being an affair more of plain human strength and nature, it did then possess elements of nobility that are wanting in the latest forms of strife, and with the width of the world and the greater necessity for self-preservation, it may have had better excuse. Yet even then there must have been Cro-Magnons who had their doubts about it, and needed some persuasion. This fellow, found in France with the spear-head in his skull, may have been told that the battle in which he was urged to fight was that which would put an end to all battles, that his world would be more beautiful than ever before, and would be safe for all his kind.

It might even be possible for him to disarm and go about his herding, or whatever occupied him, peaceful and rejoicing. Yet he may have found out that the more he fought the worse it was, and the greater the demands upon his resources.

* * *

That spear-head is a bitterly ironical sign. All along through time from then till now it has been as a master-sign, and it will continue. Though, feeling sorry for the world, we set out to rid it of war nearly ten years ago, Europe is now more armed than it was then. Hatreds between nations are fiercer, and within the nations themselves there is loss of liberty, while dictators rule. Ideas of democracy and parliamentary government are fading; indeed, if on looking back on the old year there is one general thought and conviction in regard to governmental affairs that seems to have settled itself most firmly in the general mind it is that, after all that has been said and proved regarding it, and all that was hoped for it in human happiness and progress, parliamentary government shows signs of failing because of the ambitions, the insincerities, the excesses, and the corruption of democracy. At the first thought it seemed absurd, grotesque, to suggest that there was anything wrong with the principle and practice of democracy; it appeared that it was a thing almost divine, that would assert itself and win through; and when less than a year ago Mussolini was the first leader bold enough to proclaim that a false idol was being worshipped, that democracy, and liberalism with it, were failures, and that men were even 'tired of liberty,' he was considered stupid, and condemned. But thousands, perhaps millions, are turning to that way of thinking now. If democracy fails, it is because men cannot be fair with each other. The world cannot be sincere, and in sincerity there is a panacea for all the ills, if only it could be applied. The lie is being exploited more and more. The lie in business and politics, once thought a fearful thing, is now an almost accepted means of effort, and circumstances make it more and more so. Exploited universally in the war, it is worked in the so-called peace, and forced by circumstance to more and more indispensability. Below the pleasant humour, what disconcerting truths were subtly hidden in the rectorial address that Mr Rudyard Kipling recently made at St Andrews when he suggested that the first use man made of his newly-discovered power of speech was to tell a lie, having previously been obliged to act his lies! 'Imagine,' said Mr Kipling, 'the wonder and delight of the first liar in the world when he found that the first lie overwhelmingly outdid every effort of his old mud-and-grass camouflages with no expenditure of energy! Conceive his pride, his awe-stricken admiration of himself, when he saw that, by

mere word of mouth, he could send his simpler companions shinning up trees in search of fruit that he knew was not there, and when they descended, empty, and angry, he could persuade them that they, and not he, were in fault, and could despatch them hopefully up another tree. Can you blame the creature for thinking himself a god? Unfortunately—most unfortunately—we have no record of the meeting of the World's First Liar with the World's Second Liar, but from what we know of their descendants to-day they were probably of opposite sexes, married at once, and begat a numerous progeny. And a pretty mess this custom of lying—or, said more delicately, the human practice of insincerity—has led the world into! However, if, as Mussolini says, men are tiring of liberty, they may tire of everything, and they may at last be wearied out with lying, when truth, pure and bright, may become a delight to them, the refreshment of a beautiful novelty. They may look back with horror, well justified, on the tangled web they wove 'when first they practised to deceive.' Then in their new enthusiasm, and finding that the most intricate political and all other problems are capable of instant and satisfactory solution by the application of the simple formula of truth, plainly and straightforwardly spoken, they will have done with diplomacy, of the secret and all other kinds; no more conferences or exchanges of notes of that ambiguity that is the first cousin to the lie will be necessary; disputes can no longer be, war must die for lack of its germinating and sustaining means, and we shall be well on the way to the millennium. Life may be better then, in spite of the fact that we shall have done with politics, which are mainly built on insincerity.

* * *

However, we are looking forward now. There is a firm determination, useful and good of its kind, to make the best of things, and an immediate corollary to this intention is to live the utmost for the moment, the future being so uncertain. People who move about in all kinds of social circles in these days, listening to what they hear, and considering some of the attitudes of life presented to them, have noticed particularly one definite peculiarity of what might be called the average thought of intelligent and reasonable men and women in the matter of the philosophical planning of their own lives, and that is a way of looking forward almost exclusively, but only a little way forward, since the foreground of time is almost immediately lost in thick mists that shut out the middle and farther distance. So they live the moment at its utmost and best, and leap forward to the next one with eager hope and anticipation and the intention to work it out at its hardest. Thus, in this new philosophy, it is with tomorrow, with next week, the month that follows,

and the year that comes; and the essence of the spirit of this intention is that there shall be no glances cast behind, not one of them, and no moaning on the past. Can it be doubted that there will be greater changes in the next twenty years, making bigger differences to life and the living of it, than took place in the five hundred years previous to the beginning of this century? Who can predict what enormous changes are coming upon the world, and who can even faintly imagine what may be the condition of things in the year after next? Along with all other questions, that of population becomes increasingly insistent; part of the world is much too full of people, who in the crush can only make trouble for themselves, and so we see all the old family beliefs giving way. In these distracted times it is the habit to look towards the west, to the United States, as being the land of future hope towards which life and civilisation are steadily moving, and it has been an idea that there might be room for everybody there in that spacious territory where thousands of miles were lately wild prairie and little besides; but Professor Raymond Pearl recently calculated that about the year 2100 the United States will have a population of 197,000,000, which number would be the maximum that its continental territory could sustain.

* * *

It may not matter; the condition of things indicated by the learned professor will, through wars and other circumstances involving vast international political changes, probably not arise, and, anyhow, who can think of the year 2100? Actuaries have reckoned that about seven of each thousand babies at present starting life may live to the year 2000. Such as do will pass through greater changes, endure more startling shocks, behold more amazing developments and discoveries than all mankind had done before their time; but whether they will enjoy life a thousandth part as heartily as did our grandparents is another matter. It may even be that the actuarial seven, having been deprived of liberty, will be shorn of their very lives by some new laws and necessities. I have no envy for the seven. Such as live through it will have something to think and talk upon on the New Year's Day of A.D. 2000, and we surmise that it will be a sad, sad tale. None but Mr George Bernard Shaw can exercise imagination upon a period so distant, and even farther on, much farther; and he, with his intrepidity, has written a most wonderful play, *Back to Methuselah*, which deals with life from the beginning to the future end, or at least to A.D. 31,920, which is as far as even Mr Shaw can think. His play requires five days for its representation, and it seemed when he had written it that the only chance of its being performed was to get it done in China, where they like this highly continuous sort of thing; but, most marvellously,

it was done in Birmingham only a few weeks ago, and was one of the most remarkable achievements of our own or any other stage. In the year 31,920, or 'as far as thought can reach,' Mr Shaw suggests that the evolution of mankind will have attained such a stage that human beings will then be produced from eggs after two years' incubation, and at hatching will have an apparent age of seventeen. During the period of their incubation they will have acquired and developed all sorts of knowledge such as in this age of ours can be obtained only by long years of study. In their next four years, in the open, they will live what is equal to a full life of ours, devoting it to love, to sports, and the arts, and when this period ends their hair will fall off, their beauty fade away, their sexual distinctions will disappear, and they will fare forth emancipated upon a purely intellectual life which may endure for thousands of years. Chloe, the maiden in the play, observes at the age of four—her lover, Strephon, being aged two—'I want to get away from our eternal dance and music, and just sit down by myself and think about numbers.' Elsewhere in the play 'The She-Ancient' remarks, 'The day will come when there will be no people, only thought'; and 'The He-Ancient' responds, 'And that will be life eternal.' The ghost of Lilith says that 'life is to become "a whirlpool in pure intelligence" instead of "a whirlpool in pure force."' She adds, 'Of life only is there no end; and though of its million starry mansions many are empty and many still unbuilt, and though its vast domain is as yet unbearably desert, my seed shall one day fill it and master its matter to its uttermost confines. And for what may be beyond, the eyesight of Lilith is too short. It is enough that there is a beyond.'

* * *

So, with it all, it does not appear that we are interested in the newness of a year as once we were. Kind greetings are not exchanged so freely as in yesteryear, because, it may be, of a sympathetic consciousness of the mutual and increasing ills we bear, and the knowledge that in all good wishes there are certain reservations, and that a shade of irony may sometimes be suspected. Men and women are still addicted to diaries—September even had not fully run its course when they were offered in some of the London shops—but one suspects that they are for marking future engagements only, and have no concern with the old-fashioned records of life that has been lived and stored away in memories, or with gentle soliloquies upon the world and some people it contains. Only a few months ago there was a great assembly of an international character to consider schemes for the reformation of the calendar, but the present attitude of most of us is that we care not what is done with the calendar, save that

it seems good that for each individual who has accepted the philosophy of the present and the future a new one should begin each morning, while the brooding rest, conscious that history will have its fling in its reactions upon present and coming time, reflect that it would be well, when 'reparations' are really fixed, when this uneasy world settles to new tranquillity, with lambs and lions resting by each other, that then we should start a new calendar for us all, and really begin the world afresh. For the present such things as might be said on calendaring and calendars appear too trifling for those in mood for exploiting the first of January to its utmost while keeping half an eye upon the second. It would, for example, be of no avail to tell them that as a matter of scientific convention and solar reckoning they are late with the new year, and that, considering a moment of time as the same elsewhere, whatever Professor Einstein may say upon it, independent of questions of light and dark, the year opens, first of all, by the working specially of what is known as the 'Admiralty Date-line,' to the small community who abide on Chatham Island, about five hundred and forty miles east of New Zealand. This occurs about noon on what remains for us the last day of the old year. Afterwards New Zealand, Australia, Asia, and Africa greet the new adventurer coming on to us. How many people know that the use of January 1 for the New Year was not begun in England until as recently as 1751, which was within the period of our great-grandfathers; while in Venice the change from the previously existing convention was not made until 1797? One doubts if the reformers of the calendar will ever achieve their object, because days and weeks and months would be so much standardised as to be very dull. Our old calendar at least affords variety, and who shall say, in spite of common declaration, that after all it is not better for the holiday-makers, who are most concerned, that Easter and Whitsuntide should wobble about somewhat, giving us one season, perhaps, more than the tail of departing winter, and another the full face of smiling spring? Interesting, surely, are our calendars, with notes upon the important things that have happened on each day, showing how great event is never idle, while the universal analysers may discover in this curious co-ordination of names of days and figures of months some strange cases upon which significance, according to their fancy, may perpend. You may not know that the ordinary year, as distinguished from the Leap Year, always ends on the same day of the week as that on which it began. Or that no century can begin on a Wednesday, a Friday, or a Saturday; that October starts always on the same day as January; that there is a calendrical *entente* between February, March, and November, which always begin on

the same day of the week; while May, June, and August, in their sunny appearance so placid and gentle, are to each other like Balkan entities, and never will start on the same day. However, if little or nothing of all this matters, there is one thing that does so still, and it is an affair of the goodness of the human heart and the belief in fair destiny. It is still a pleasant thing to wish a friend a happy and a prosperous New Year. Last night, when all was still, and all the bad news of the day had been published, I was glancing again through a book of sorrows—the memoirs of Heinrich Heine—when I came to a letter with which one may, in good spirit,

end these notes. Heine was writing from Paris on the last day of the year 1842, and he said: 'I am writing these lines in the last hours of the unpleasant departing year. The New Year is at the door. May it be less horrible than the old. I am sending my sorrowful good wishes across the Rhine. I wish for the stupid a little understanding, and for the understanding a little poetry. I wish the most beautiful clothes for the women and much money for the men. I wish a heart for the rich and a little bread for the poor. But, above all, I wish that we may blackguard each other as little as possible during the New Year. . . .'

A GIPSY OF THE NORTH.

CHAPTER IV.—continued.

ROY CARWYKE did not speak for a little time. His mind was busy with the possibilities of the situation. If they could win clear of the camp and get a day's start, it would be almost impossible for Standifer and his companions to overtake them. Then, once they were assured that the pursuit had failed, they could move in any direction they chose: northward to the whaling-stations, or southward to the mining-camps; and in either case the girl would be saved from Standifer's machinations.

'That river would be worth trying,' he said at last.

'It's ther one way; if Miss Norma can be persuaded, as I reckon she can, for she's about given up all hope of her father ever comin' back, an' I guess she'll quit if only to save ther tribesmen. Yo' stop here, Mista Carwyke, an' I'll go an' talk to her.'

He withdrew from the tent, and Carwyke waited for the crack of the sniper's rifle. It did not come, however. Apparently the Standifer crew had ceased hostilities for the moment, and after a little time his mind grew absorbed in the possibilities of the situation. To plunge into the waste was, as he owned to himself, a hazardous expedient, but it seemed the only way, since to attempt to follow the coast to the whaling-stations in the north was impossible. Standifer had a boat, and would follow at all costs; and, unscrupulous as he was, would not hesitate to pick off Billy and himself once they appeared in the open. But if they could make the river which the white Eskimo had mentioned, leaving their enemies uncertain of the direction of their flight, then safety might be reached. In any case, to remain in the camp was to invite ultimate defeat, and to let Norma Mannering fall into the hands of the man who was determined to gain possession of her. The chance of a couple of flying bullets finding Billy and himself would bring that end about, and at all risks it must be avoided. He began to devise plans for

the proposed flight, and was so engaged when Eskimo Billy re-entered the tepee. 'Well?' he asked eagerly.

'Miss Norma 'll go!' answered the other man, with a laugh; 'so all we got to do now is to make ther get-away.'

'And we'll do that!' cried Carwyke joyfully. 'By hook or by crook, we'll do it!'

CHAPTER V.—FOG AND FLIGHT.

IT was high noon. The tundra slept in the sunshine, all except its multitudinous insect life, which never for a moment ceased its activities. In the direction of Standifer's camp there was no sign of movement, and the morning had passed without any act of hostility; but Carwyke had no doubt that watchful eyes were staring across the waste, keeping watch on the Eskimo village.

He himself lay on the damp moss between the skin-tents, his eyes fixed on a bank of fog which hid the face of the sea a mile away. The wind was blowing inshore, and if only it would bring that great bank of fog with it, the chance for which he waited would be given.

Slowly the gray bank drifted towards the coast, then hung as in iron. Again it moved, obliterating the wet face of the sea as it came. The wind freshened a little and the fog trailed out, sending its skirmishers to the very edge of the tide. Carwyke watched it hopefully. 'It's coming, Billy,' he whispered excitedly. 'It's surely coming.'

'I ain't so sure,' answered Billy. 'A fog'll do odd tricks up here. I've seen it stand for half a day like a wall wi' ther sun playin' all about it.'

Carwyke looked landwards. The tundra was bright with sunlight, its green mosses and starring flowers flashing gloriously, and, as he knew, every line of the camp must be visible to

the vigilant watchers southward. Then he turned his face to the sea again, and as he did so saw the gray vapour blown like smoke across the beach and surge over the rising ground. A wisp of it, damp and cold, chilled his face. The line of the beach was almost hidden, but the tepees still stood in unclouded sunshine. He waited breathlessly, almost prayerfully. Then the fog rolled forward—a dense mass of clinging vapour. He looked around. The sun was obliterated, the rolling tundra was no longer visible, and the tepee three steps away was not to be seen. The transition from broad daylight to gray gloom was startling beyond belief, but he did not stay to comment on it. Leaping to his feet exultantly he cried, 'Now we make the get-away, Billy. Sharp! Get the men to work!'

All the morning, since the fog had shown signs of drifting inshore, preparations had gone quietly forward, and now there was little to be done except launch the kayaks with such stores as were available. At a word from Billy the apparently sleeping camp woke to activity, and men and women hurried down in the direction of the sea.

The gray mist drove like fine rain, but was infinitely more dense, hiding everything from view. It set a crystal dewdrop on every hair, moisture trickled in runnels down every smooth surface that it encountered, and, settling on the clothing, slowly drenched it. Carwyke, noting the fact, laughed with excitement. There was an Eskimo watching at the edge of the encampment, but now his services were superfluous. The heavy vapour spreading across the tundra would hide all its contours, and if Standifer's crew tried to approach the camp in the fog they must inevitably lose their way, unless they came along the coast. And that contingency had been provided for. On the spit where Carwyke himself had lain was another Eskimo armed with a rifle, with instructions to fire a warning shot on the least sign of any overt movement on the part of the enemy.

In a very few minutes all was ready. Norma had already taken leave of her friends, and most of the Eskimos were on the shore, when there came the faint far-away sound of a rifle-shot, answered by three others.

'They're comin' sure!' cried Billy. 'Quick, Mista Carwyke. Ther devils have a boat, remember.'

The girl was already afloat, and in a moment Carwyke himself was skimming the gray face of the sea in the light Eskimo craft. He was no stranger to the kayak, having often used one at Nome, and he plied the long paddle with dexterity. Eskimo Billy brought up the rear, and as he followed in the wake of the others the fog thinned abruptly for a moment, and from the southward came a shout. Carwyke looked hastily round and visioned a short stretch of open water and beach, around which the fog

hung like curtains, hiding the rest of the world. On the edge of the open water a boat was driving.

Instantly he guessed what had happened. Standifer, grasping the possibility of his quarry's escape by sea under cover of the blanketing fog, had taken means to anticipate it. Sick with apprehension, Carwyke cried a warning to the girl, and drove his own light craft forward with almost demoniac energy. They passed into a denser zone of the mist, and settled into a steady pace. Once, twice, they paused to listen, and Billy thought he caught the sound of rowlocks; but neither of the others heard it, and an hour and a half later, uncertain whether they were pursued or not, they passed into the sunshine. The tide was falling, and ahead Carwyke caught sight of the low mud-banks of a small estuary.

'There's ther river,' Billy shouted to him. 'We win the first lap!'

They swung into the river, which had here a sluggish current, and without pause pressed on. The mosquitoes hung about them in clouds, and never seemed to grow less, drive forward as they might; but for the moment no one of the three regarded the bloodthirsty insects. Carwyke's eyes were fixed on the girl, who still led the way, her paddle flashing tirelessly in the sunshine, her white-skinned kayak gleaming like some great water-bird on the desolate river. His mind was busy with the mystery that she embodied. Why was Standifer so eager to get hold of her? That some other motive than the natural attraction of her beauty was behind the scoundrel's activities he was convinced, and Billy, as he remembered, shared that conviction. He recalled the white Eskimo's suspicion that Standifer was the man who had cut the mooring-line of Mannering's kayak, and accepting it as truth, strove to link that nefarious deed to Standifer's reappearance on the coast, without, however, obtaining any inkling of the motive that had dictated the scoundrel's actions. Cudgel his brains as he might, he could get no clue to that; and presently he gave up the hopeless task, and with his eyes still fixed upon the girl, gave himself to other thoughts.

What was he to do with her if they made good their escape? From the girl's own account he had gathered that she had no knowledge of her father's friends or of her relations in the southland, if she had any; and the problem before him when they reached civilisation, if they ever did, was not exactly an easy one. He might advertise, of course. There must be some one interested in the girl, or Standifer's unknown motive was entirely inexplicable; and there must be people interested in her father's sacrificial labours.

As the latter thought occurred to him, doubts leaped in his mind. Three years had passed since Mannering's disappearance from Unapik, and no one outside had missed him apparently;

at all events no one but the man from whom they were fleeing had ever come to look for the lost man's daughter. Was she really friendless and alone in the world?

It was barely possible; and as the thought was in his mind, his eyes sought the lissom figure ahead once more, and, as they did so, a way out of the difficulty that would follow on their escape leaped to his mind. Standifer had proposed to marry her; why should not he himself—?

His bronzed face flushed at the half-finished thought; then the light of dreams came in his eyes, and a half-whisper broke from him, 'Why not?'

His mind played with the thought. But for Eskimo Billy, Norma was apparently friendless. She was inured to the hard life of this bleak land, in which he himself was a wanderer seeking rainbow gold; together they might shape a life that would be one of happy comradeship. There was that claim of his down at Coldfoot. It had promised well, and probably the man whom he had left working it on half-shares had piled up for him a quite respectable pile of dust by now. He would be able to make the girl happy, and—

He gave a little laugh at himself, and the sound reaching the girl, scarcely a kayak's length away, caused her to turn her head swiftly, and for one moment her blue eyes met his own in inquiring glance. He laughed again, reassuringly this time.

'There is nothing wrong!' he called.

Norma flashed a smile, playfully flung back a little shower of spray with her paddle, and then in silence they pressed on, with now and again a backward look on their course for any sign of pursuit.

Between the low banks of emerald-green they drove for hours, halting only for a brief meal at the tail of a long rapid, where they were compelled to make a portage. Nothing of Standifer and his crew was seen; and as in the northern sky began the rosy glow that told of the approach of the summer midnight, they made a camp at a place where a few dwarf spruce and birch trees lifted dead and stunted arms. Billy gathered an armful or two of these lichen-grown sticks, and with the aid of some dead moss kindled a fire; which, when the cooking was done, was turned into a smoke smudge by the addition of armfuls of caribou-moss. In the reek of this they were able to eat the meal in comparative immunity from the mosquitoes and a plague of troublesome black flies, which had swarmed most unexpectedly in the desolation.

When the meal was over, the girl, more tired than the men, wrapped herself in the rabbit-skin blanket, and in the drift of the smoke lay down to sleep. Almost in a minute the slumber she sought came to her, and glancing at her,

Eskimo Billy smiled; then a tender look came on his face as he whispered to Carwyke, 'This sort of thing is rough on a girl kid like thet!'

'Yes,' Carwyke agreed, a light of tenderness shining in his own eyes as he looked at the sleeping girl. Then he spoke again. 'Tell me all that you know about her father, Billy?'

The ex-whaler puffed stolidly at his pipe for a moment, then whispered back, 'Don't know thet there's much to tell thet you haven't already heard, Mista Carwyke. Mr Mannering was a good sort, but a bit queer, I reckon, or he'd never have let thet kid stop in this country after her mother died. No sane man would when ther chances of death more than balance ther chances of life. I used to feel thet as I watched ther toddler—me who am only an old whaler turned squawman—an' I tried to tell him so once. But Mista Mannering jest shook his head. "She's in ther hand of God, same as you an' me, Billy," says he. "Hand of God," says I—"it ain't very plain to be seen i' these latitudes, an' I'd as lief see ther little one in ther hand of a woman down in God's proper country, which is ther blue grass district down in Kentucky where I was reared, sorrow to me thet I ever left it to go a-combing salt-water."

"All countries are God's," says he in ther solemn way thet he had.

"Yep!" says I, "but some more than others; an' this abomination of desolation ain't one of them, I reckon."

He jest shook his head at me for thet in a way he had, an' begins to talk about ther brave and hardy Eskimos who find ther land a Garden of Eden, an' at thet I chipped in again, "'Tain't no Garden of Eden for a li'l white girl," I says; "an' if I was yo', I'd jest take her south to her relations jest as soon as I could make it! If yo' must go on dry-nursin' ther souls of Eskimos who ain't got none, yo've no right to put it on to ther kid. Take her down to her relations—"

"Relations!" he bursts in; "yo' don't know what yo're talkin' about, Billy."

'Maybe I didn't; but I reckon I knew I was right about ther kid stoppin' up here, an' I said as much. He jest turned away an' began to work at some damn papers in which he was—reducing, that was ther word he used—ther Eskimo lingo to writin' so thet he could teach 'em to read, as if there was newspapers for 'em to read up here; an' when later I again made bold to mention sendin' ther little one south, he jest told me in so many words to mind my own business, which, where Missy there was concerned, I did for ever afterwards, holdin' my peace when I felt inclined to up an' tell him what a gallows-fool he was—not thet he wasn't a saint for all that.'

'Did he ever get any letters?' asked Carwyke.

'Nary one thet I knows of; though, as he

went to Icy Cape twice a year to gather ther letters that ther mail man brought in, 'tis more than possible that he had some. But he never mentioned anything about his folk, an' it was newspapers an' books that seemed mostly his interest—them an' the Eskimos about which, if I may say so, he was always a bit balmy. Seemed to think they was one o' ther lost tribes, though how any man who looks at ther uoses can think that beats me!'

'And he wasn't in touch with any of the missionary societies?'

'Not that I know of! He never mentioned 'em, an' he got no reports, for I used to read every blame thing that he brought back from ther trading-post, havin' ther run of such literature as there was about. An' dry readin' it was too, a lot of it!'

'I dare say!'

For a time Carwyke sat silent; then his eyes wandered to the sleeping girl, and stayed there for a minute or two. At length they returned to Eskimo Billy again.

'I don't quite see what's to become of Norma if we win out to civilisation.'

'Tis a bit of a corker!' owned the ex-whaler; and after puffing stolidly at his pipe for a minute, added, 'Yo're a mite too young to adopt her, an' play ther heavy father!' A gleam came into his eyes, and a slight grin wrinkled his good-humoured face, 'But yo' ain't no ways too old to be her husband.'

'What put that into your head, Billy?' demanded Carwyke sharply.

'Oh, well, say ther general circumstance of ther case,' replied the other easily. 'Yo' comes to ther girl's help; yo' saves her from ther villain, which is Standifer, an' after perilous adventures yo' brings her to civilisation an' marries her.' He broke off and then chuckled as he added, 'I've read romances in my time!'

'That's quite clear!' answered Carwyke, with a smile, but it was noticeable that he offered no further comment upon the ex-whaler's suggestion.

(Continued on page 87.)

LABUAN: A GEM OF THE ORIENT.

By Sir HERBERT RUSSELL.

OF all the places visited by the Prince of Wales during his Eastern tour—and these, in the official programme, numbered 108—none possessed a greater fascination of romantic appeal than the little island of Labuan. Probably the name is more familiar to most of us as a memory of stamp-collecting days than as a reminiscence of the geography class. And even amongst those who thus vicariously know of it, not everybody could drop his finger upon it on the map, for it is really such a tiny spot, nestling off the coast of North Borneo.

Labuan is a veritable gem of the Orient. When the *Renown* had come to anchor in the great blue lagoon, in one corner of which is sprinkled the handful of European bungalows and the atap-thatched, pile-perched native hutches constituting Port Victoria, all agreed that the picture was one of surpassing tropical beauty. Everywhere from the sand-fringed foreshore a riot of vivid foliage rolls back against the pale glare of the sky. Jungle shoulders forest, the giant merbau and rasak overshadowing the lower density, although the scimitar-topped palms seem to have done well in the eternal green battle for space.

Yet a visit to Labuan sends one away rather sad. It leaves one with an impression of expectations and ambitions which have not been fulfilled, and which never will be fulfilled. At the end of last century there were about fifty European inhabitants upon the island. When the *Renown* was there, in May 1922, the number had dwindled to seventeen, of

whom eight only were quaintly referred to as people of standing. The mouldering wharves and the baked jetty at Port Victoria tell the tale of languishing trade—of trade, indeed, that has never come. The brooding silence of the velvet spot, broken only by the occasional *cheep* of a parakeet or an Argus-pheasant, and the eternal strident hum of the cicada, seems ominous with its message of human failure—that is to say, white human failure, for the suave, soft Dusun comes and goes amongst the green shadows unto the bowed and shrivelled climax of his placid existence.

The truth is that this rich, languorous island is no white man's spot. Five years on end is said to be the limit of endurance of the most robust constitution; then comes the anæmic lassitude of sheer physical enervation. A Lloyd's Agency and a little station of the Eastern Extension Telegraph Company are the only survivals of past attempts at commercial activity. It is a great pity, because the island is richly endowed. In one corner of it is a deposit of bituminous coal, of which the main seam alone is estimated by geologists to contain 12,318,900 tons down to a vertical depth of 2000 feet. From 1847 to 1879, heroic attempts were made to mine this coal, which is said to possess the best steaming qualities of any found in the Far East. During twenty-one years no fewer than twelve managers carried on the struggle, which ended in bankruptcy; and to-day the gaunt and blistered plant may be seen, a pathetic symbol of the futility of

man against the inexorable limitations set by Nature.

Labuan as a British possession was born in romance. The piracy of the Borneo dyaks had become so bad that it was imperative to make some organised effort to drive these gentry back to their own domestic hobby of head-hunting. So Captain Mundy, having demolished the stronghold of Haji Saman on the Membakut River, and collected a great number of brass cannons and wonderful gongs during the course of this destruction, demanded that the island of Labuan be ceded to Great Britain as a naval station. The sultan, after seeing the Illanuan pirates ferreted out of their lairs, and realising the absurdity of arguing with British corvettes, agreed that this was quite a good idea; and on 24th December 1846 the *Iris* and the *Wolf* anchored in Victoria Bay, dressed ship and fired salutes, and a landing-party proceeded ashore, clearing a spot in the jungle, where Captain Mundy hoisted the Union Jack. Incidentally, Rajah Brooke, of Sarawak, was appointed first Governor of Labuan.

In the light of the consequent languishing career of this luxuriant little Crown Colony, of some forty-seven square miles in area, it is somewhat melancholy to recall the high hopes for its future expressed after we had taken possession of it. With its excellent geographical position on the great trade-route between Singapore and Hong-kong, its wonderful natural harbour capable of accommodating a whole fleet of dreadnoughts, its abundant supply of fresh water, and its wealth of steam coal, prediction declared that it would become a second Singapore. The Labuan Trading Company negotiated valuable concessions with the Sultans of Brunei and Sulu. But the company had an existence which was very much more adventurous than profitable, and died a natural death without having achieved anything in the way of lasting development of the island.

The roads in Labuan, which curl away under deep-green tunnels from Port Victoria, are of soft red sand, almost blood-like in hue, and forming a startling contrast with the verdure. On each side of them lie stagnant ditches, the slime of which seems acrawl with strange forms of life, whilst mosquitoes darken the surface like shimmering clouds. Yet the island is fairly free from malaria, and also from poisonous reptiles. The land rises gently from the glaring white beach to a little central eminence, near the top of which stands the Residency, a straggling bungalow almost canopied by the fronds of lofty coco-palms. From the summit, when the sun-haze permits, may be obtained a fine view of the Mount Kinabalu, in North Borneo, soaring in lonely violet grandeur some eighty miles away.

There are two quaint old ramshackle *gharries* in Port Victoria, the saffron-coloured drivers of

which did a roaring trade during the visit of the *Renown*; these are the only means of locomotion on the island. The few straggling shops in Port Victoria are of the Indian bazaar type, and, apart from the elementary necessities of life, appear to deal chiefly in extremely gaudy sarongs, conical crowned straw-hats, and gongs. That they ever do any business it is difficult to believe from the air of immobile contentment with which their proprietors settle down at opening-time betwixt the rattan blinds, as though nothing on earth would ever induce them to rise again.

A quaint-looking little steamboat, a sort of cross between a miniature Mississippi ferry-boat and a Dutch *botter*, maintains connection with the mainland, making creaking and laborious trips to Brunei and Jesselton whenever there is anything worth connecting about, which is very rarely the case outside of the occasional pony-races; for the Dusuns are great gamblers, and have a method of their own in dealing with bookmakers which does not tend to render that business either lucrative or attractive.

And touching sport, one finds evidence in this little gem of the shining East that wherever the Englishman comes there will games thrive. From out of its seventeen inhabitants, several of whom are women, Labuan was able to put up a cricket-team to challenge the *Renown* whilst she lay there. Likewise the island offered the officers of that ship the hospitality of its golf-course.

The bathing in the glass-clear water which shales softly upon the very flat beach is so attractive that one is apt to ignore the perils with which it is beset; for the lagoon is full of sea-snakes—green, writhing creatures, up to three feet long, with a deadly bite—and of the ferocious bonito, which has a notorious proclivity for snapping at the most vulnerable parts of the human anatomy. After dark, when the *Renown* was lit up, it was a wonderful spectacle to watch the sea-snakes wriggling around her, attracted by the gleams on the water, and they would often curl their way half up the steps of the gangway ladders.

That vessels occasionally call at Labuan is suggested by the existence of a harbour-master and a Lloyd's station. The harbour is well buoyed and beacons, but this is a legacy of the days when the island was a naval station. Lateen-rigged dhows, engaged in an indiscriminate sort of bartering traffic, use it, and so, likewise, does the local fishing-fleet, consisting of about half-a-dozen mat-sailed sampans, of a collective burthen of about half a ton.

If a cinema producer were searching the world over for a veritable Robinson Crusoe island, he might well select Labuan. The traces of habitation are so few and unobtrusive that it is the easiest thing imaginable to lose them. And then all that remains is the riotous beauty

of such tropical growth as would make the most fitting environment conceivable to a lonely figure in goatskins, with umbrella and musket. Here is the very creek wherein Will Atkins and his mutinous mates set the Spanish captain ashore. There is the very sand, smooth and dust-like, in which appeared the famous footprint. Yonder are the giant trees from amongst which Robinson selected the one from which, 'with infinite pains,' he hewed his great periagua, upon the savanna over which he had not the strength to drag it.

Some day the wonderful coal deposits may attract a new effort to mine them. Exploration for oil has taken place, but without result. The British spirit of 'having and holding' is indomitable, and Labuan will continue under the Union Jack. But beyond the telegraph-station, which is only a link in an alternative line, it is impossible to see what there is in this delicious tropical island to draw white people to it. Venturers of the past have enterprised here and

failed. The seventeen who were remaining on the island at the time of the *Renown's* visit included the Cable Company's staff, the members of which are relieved every two or three years. The time may well be not far distant when these will represent the only European inhabitants of Labuan.

It is indeed a case in which Nature insists upon conformity with her law of the fitness of things. This veritable elysium is essentially the land of the silent, mysterious people born to live in it. White women cannot propagate, and white children cannot be reared in it. The Dusuus have watched the coming of sturdy men full of hope, and their stealing away, wan and full of sorrow. For there is the strange fascination of a deadly nectar in this radiant spot, and whilst the spice-scented heat is gradually sapping all joy of life, still there clings the reluctance to depart. One can realise this even from the haunting memories of a brief visit.

THE VERGER.

By H. K. DERRY.

I.

WOODCOCK was a tall, clean-shaven, cadaverous-looking man, who had lived in the precincts of Ebechester Cathedral all his life.

His father had been the boiler-man; his uncle a bell-ringer; his nephew, possessing a fine tenor voice and social ambitions, was training in the hope of obtaining a position as lay-clerk. His wife, childless and a semi-invalid, had once been head-housemaid at the deanery.

Woodcock himself had entered the cathedral as an under-verger at the age of twenty-five; now, twenty years later, he held the post of head-verger, an office that he discharged with all the dignity and efficiency of an artist.

Of affairs in the outer world of material things he knew nothing. Companies might rise and fall; treaties be drawn up, signed, defied; Derby favourites might die in their stalls; volcanoes pour out death upon defenceless thousands—the verger did not so much as don his spectacles to read of such things.

But if in the cathedral a bedesman chewed tobacco, a choir-boy forgot his mortar-board, a lay-clerk whispered to his neighbour, or a minor canon slipped a phrase in the prayers, he marked it down and scored a cross against the offender's name in the imaginary note-book of his mind.

The cathedral history he knew like the story of his own life. The saintly Herefrid, in whose time it had been built, was as real to him as the precentor. He knew the meaning of every half-obliterated sentence on the ancient tombs; the reason and history of every alteration of

masonry; the origin of all the curious customs of ritual.

Religiously he believed the stories of the ghostly appearances of St Herefrid; devoutly upheld their veracity to the sceptical under-vergers. Many times he had come last thing at night to the echoing building, officially to see that everything was well, secretly in the hope of a glimpse of that pious figure in its black Benedictine habit and sandalled feet, gliding up the aisle, with its swinging lantern and noiseless, ghostly tread. The fact that he had never seen it, and the realisation that fewer and fewer people were inclined to believe in the ghost, were the greatest disappointments of his tranquil life.

As he moved down the aisle after matins, an American voice accosted him. 'Am I addressing Mr Woodcock?'

Woodcock halted and made a slight bow. He knew a gentleman when he met one. Even Americans he had learnt to place in their social classes with accuracy. 'Yes, sir.'

The American smiled widely and extended his hand.

'Very glad to meet you! I come from the States. I heard of you over there from a friend of mine who made a European tour and saw all the English cathedrals—Townsend by name. You recollect him?'

The verger shook his head rather dazedly. The wonderful fact that he had achieved fame, thus baldly presented to him, robbed him of the capacity for speech. He could take in nothing but the knowledge that his name had

reached America. It was the triumphant justification of his existence! Over the Atlantic, when men stopped discussing money-making and spoke of art and the English cathedrals, his was a name connected with them. When they came to England, it was he whom they wanted to see. Enough!

'Probably not,' the visitor continued. 'You must meet so many of us. The point is, Townsend told me that when I came to Ebchester I must get you to show me round. Am I to have that good fortune—or must you conduct a party? I see one—'

'Oh no!' Woodcock had recovered his self-possession. 'It will be a pleasure to show you everything. I never take a party unless we are especially busy. Please come this way. We will begin at the north porch. May I ask you if you have read the subject up at all? Ebchester's history is peculiarly interesting.'

II.

An hour later, his eyes bright, his cheeks pink, Woodcock emerged from the glowing paths of the past, where he had wandered with the man beside him down the long avenues of history.

'It's a wonderful place, sir,' he said, 'wonderful! I've lived in its shadow all my life. St Herefrid's as real to me as that bedesman by the door. The stones are still speaking of him.'

The American nodded sympathetically, but with a touch of humorous detachment that betokened him man-of-the-world first and artist second. 'Sure! And these tales of the ghost, you believe them too? You have seen it, perhaps?'

The light died in the verger's eyes at the question. 'No,' he admitted sadly, 'I have not seen it. But he lives here, I am sure, for all that. He couldn't have borne to leave it. The finest cathedral in Europe!'

The American made a quick gesture. 'Ah! There,' he replied, 'I must differ. The finest in England, certainly, and that is high praise. You have visited all the English cathedrals?'

Woodcock smiled in a slightly superior fashion. 'Many times! But I have been abroad also. The study of architecture is a passion with me. Belgium, France, Germany—Cologne, truly, is wonderful; but it cannot touch Ebchester.'

The American nodded. 'I agree with you. I was not thinking of Cologne. Have you ever been to Milan?'

Milan. That was in Italy. As he shook his head, a pang of jealousy shot through the verger. Those journeys to Bruges, Paris, Cologne, had entirely emptied his slowly-filled pockets. Italy, that garden of architecture, was beyond him; yet this man was telling him that it held a rival to his beloved Ebchester!

'No,' he said slowly, 'I have never been to Milan. Has it a cathedral to compare with this?'

'It is finer than this. The Duomo is the most wonderful creation. You should certainly visit it. I should like to hear your opinion. You are prejudiced, you know!' He held out his hand. 'Thank you immensely for taking me round. It has been a most enjoyable hour, with—may I add?—a remarkable man. But you should certainly see Milan. A visit to the Duomo, and an encounter with St Herefrid on his nocturnal rambles—may I suggest them as the two things needed to crown a most original career? Good-day to you, Mr Woodcock. I hope we may meet again.'

Smiling, the American turned and strode towards the door, pausing, however, at the poor-box nailed to a pillar to push a twenty-pound note through the slit at the top.

III.

For the remainder of the day, three sensations took possession of the verger's mind, presenting to his brain a rapid series of vivid pictures.

First was his delight in the knowledge that his fame had reached America; that, even in his obscure and unusual line, he had made a name for himself; that over there, when men talked of their tour of the English cathedrals, Woodcock was a name connected with their reminiscences.

Then close on this picture came the decisive tones of the visitor. 'Milan . . . it is finer than this,' and a stabbing, furious jealousy would seize him—jealousy that anything could compare with this cathedral of his, jealousy of the man who was wealthy enough to visit it and acquire the advantage of superior knowledge to back his opinions, and a desire, fierce and poignant, to see the Duomo himself, and prove with his own eyes its inferiority to his treasure.

To meet St Herefrid was not within his powers, but a trip to Milan during his fortnight's holiday—well, that was not possible either, since his wife's last illness and his purchase of a costly old book on Ebchester history at an auction sale—not possible unless—

There were no poor in Ebchester. That twenty-pound note would be thrown away on its prosperous citizens. The exchange was very low on the Continent—and he kept the key of the box.

For the first time in his sheltered, decorous existence temptation faced Woodcock in the austere gloom of the cathedral.

During his luncheon-hour he studied the volume Malt. to Pear. of his encyclopædia, and returned to work with his mind a battle-ground of envy and obstinacy.

Dividing the close printing of the page on Milan was a photograph of the Duomo, depicting its wonderful pinnacles, with human beings,

like ants, wandering around it. He read that it was built entirely of marble, and that the exterior was adorned with some six thousand statues in niches.

Elbchester cathedral was of stone, and contained scores of niches from which the statues had been flung by vandal hands in the sixteenth century. Of course, the entire character of the two cathedrals was dissimilar. In that respect one might say there could be no comparison. Thus he argued, striving to reassure himself; but the American's voice, decided, yet tolerant—as if half-amused at his ignorant prejudice—sounded maddeningly in his ears. 'It is finer than this. . . . You are prejudiced, you know!'

IV.

At twenty minutes past nine, when his wife had laboriously climbed the stairs to bed, the verger let himself quietly out of his house, and padded down the deserted street.

It was a balmy October evening, and couples were still pacing the roads. Some of them Woodcock recognised, and these he greeted in his customary quiet fashion. There was nothing unusual in his presence abroad at this hour; there would be nothing unusual even in his visit to the cathedral. His passion for the building was well known and, though scarcely understood, respected.

Boldly, therefore, he approached the north door, key in hand, and, as the clock chimed the half-hour, he closed it gently behind him. Feeling in his overcoat-pocket, he withdrew an electric torch, not liking, at that hour, to turn on the electric lights, which would shed their beams through the windows.

He paused for a minute, his bulb illuminating the flagstones, to pay homage to the spirit of the edifice, for it was always at night-time that its spirit seemed to stir and waken. Through the day, while the eyes of careless sight-seers vulgarised its beauty, and the sound of their voices and boots shattered its sacred silence, it stood, as it appeared to Woodcock, veiled—as if the mere shell of it, unable to escape, waited till the peering eyes, prying fingers, and garrulous tongues, had done their worst and departed. Then its soul, emboldened by the stillness and gloom, would steal forth from the cage of Time, fill the spaces and kiss the crannies, rising like incense up into the dim tower.

Woodcock leaned against a cool pillar and meditated, his arm encircling it caressingly. The spirit must have heard, that morning, the voice of the American disparaging its beauty. Well, he had come to vindicate its honour. He was going on a pilgrimage to Milan, to prove once for all whether Elbchester had a right to call herself the queen of cathedrals!

Almost it seemed a sacred cause. Unwaver-

ingly, and with no sense of guilt, he moved round the pillar to the wooden box, feeling for its key in his waistcoat-pocket.

Stealing? No such thing! The money was to be used, not for his own ends, but for the glory of the cathedral he served—a far greater cause, surely, than that of the idle unemployed of Elbchester. The American's gift had been a tribute to the cathedral. For the cathedral, then, let his gift be spent!

V.

He was fitting the key into the lock when a sound made him hesitate.

It was a singing squeak, as of some metal rubbing against other metal, and the regularity of its repetition gave the impression that it was caused by some rhythmic movement.

Woodcock spun about, half-ashamed of his galloping heart, and searched the darkness before him.

From the direction of the squeaking sound now came a bobbing light, peeping from behind a pillar and disappearing again, as if it, too, depended on some regular movement. The verger watched, fascinated with horror and curiosity, the shadow grow sharper as it increased its strength, till at length it emerged altogether into the middle aisle, swinging a foot or two from the ground.

Added to the noise of the squeak was a flapping tread, and now the light explained both sounds, for its form showed as a hurricane-lantern, swinging as it moved on its handle, and displaying two sandalled feet that advanced slowly behind it, kicking automatically the long skirts of a black garment as they came. A form, tall, dignified, in a monk's habit, was moving towards him.

At first sight of the lantern Woodcock had switched off his own torch, and now he receded farther behind the pillar, hoping to keep out of the lamp's circle of light. His heart was hammering against his chest, his lips were sticking together, for, even if the figure had not been dressed in the costume of a Benedictine monk of the fourteenth century, something about its walk, its aloofness, the remote expression of its shaven, awe-inspiring face, would have told him that at last his wish had been granted and his eyes beheld the ghost of St Herefrid.

But in what circumstances! His clammy fingers were still fastened on the poor-box key; his feelings, far from being those of the reverent joy he had always anticipated, filled him with a terror of discovery.

The light from the lantern flashed suddenly full on him, and as he backed away he saw that the monk had left the middle aisle and was making straight for the pillar to which the poor-box was nailed.

Only the knowledge that his boots would

waken the wildest echoes in that silent place prevented the verger from turning and tearing up the north aisle. As it was, backing still farther away, he watched, with a fascinated horror, the figure slowly approach; his lantern, no longer swinging, lifted to illuminate the pillar.

Held thus, its light fell full upon the monk's face, and Woodcock saw that it was faintly smiling—a smile that lent to its dignity and austerity an unutterable charm. His right arm, under its voluminous sleeve, moved, and a hand emerged, stretched out, and felt the lid of the poor-box. Then, apparently finding it satisfactorily fastened, it dropped again, and the figure turned, casting, as it did so, a glance straight at the trembling verger—a strange look that saw him and yet did not see him, that rested upon him and yet went right beyond him, as if, through the shell of his body, it saw the vital realities of his soul.

The lantern, lowered once more, began its squeaking song, its radiance swinging to and fro at each sandalled step. The light became fainter; now disappeared entirely behind a pillar, now appeared again in the direction of the south door. Then, suddenly, it vanished. The flapping ceased, likewise the singing squeak. St Herefrid, through the barred and bolted door, had departed into the cloisters.

Shivering and gasping, as if he had received a shock of cold water, the verger dropped the key into his waistcoat-pocket, let himself out of the north door, and locked it after him.

VI.

The head-verger, hurrying down the north aisle to speak to a bedesman, was accosted by a voice that, in its well-bred American tones, was faintly familiar. 'Good-day, Mr Woodcock. Had a spare half-hour between trains—thought I'd have another look around your cathedral.'

Directly he saw who it was, Woodcock turned, smiling. 'So you wanted to come back, sir? Even though it is inferior to Milan!'

The American laughed good-humouredly. 'You have not forgotten that. May I ask if you have taken my advice and paid the Duomo the compliment of a visit?'

The verger shook his head. 'I'm afraid not. I'm a very busy man. But since I saw you I have climbed one more rung in the ladder of what I think you were kind enough to call "a most original career."'

The American was much intrigued. 'Indeed? Ah yes, I remember! I suggested a visit to Milan, and an encounter with—with— You don't mean that you've seen St Herefrid, Mr Woodcock?'

The verger's smile was pardonably superior. 'Just that,' he replied. 'We met one evening when I was taking a last look round the building. At least I saw him—but I do not think that St Herefrid saw me! He was taking a last look round himself. Curious coincidence!'

THE MONTH: SCIENCE AND ARTS.

THE WORLD'S MOST POWERFUL LIFEBOAT.

FROM the tentative beginning made in 1905, the motor fleet of the Royal National Lifeboat Institution has increased to nearly fifty boats, and it is being added to at the rate of three or four vessels a year. The 60-foot twin-screw vessel lately sent to her station at New Brighton is of particular interest, not only because she is the most powerful in the world, but also because she is the first to be completely decked in and provided with cabins. With her breadth of 15 feet, and a draught of $4\frac{1}{2}$ feet, she has a displacement of about 40 tons. Every practicable device has been employed to render the boat unsinkable. Not only is the hull divided into fourteen water-tight compartments by steel bulkheads, but 100 air-cases are stowed inside. The skin is of teak in two layers, with calico and whitelead between them; teak has also been used for the deck and other parts. A novelty for 'Institution' boats is a huge rope 'fend-off' lashed round the sides to prevent damage from bumping when alongside a sinking

ship. In previous boats cork has been employed for this purpose. The machinery is amidships between the two cabins. Although one recent lifeboat was fitted with a cabin, it was a very small one compared with the accommodation below in the later vessel, which is sufficient for fifty people. Moreover, the cabins are warmed by hot-water radiators; an urn and an oven, heated by electricity, provide hot drinks and food for the rescued. Other innovations include a hood for protecting the steersman, a net into which persons can safely jump from a sinking ship, and a powerful searchlight. The two engines are of the type described in our issue of May 1923. Each develops 90 horse-power at 800 revolutions a minute. The propellers turn in tunnels, which protect them from damage by wreckage or as a result of touching the ground. Every device making for reliability is embodied in the machinery outfit. For instance, instead of the water to cool the cylinders being drawn from the sea, fresh water is used, being pumped round a closed circuit which includes D-shaped pipes placed under the bottom of the

boat, in which the water is cooled. Incidentally it may be noted that some of the hot water from the cylinders is used to heat the radiators in the cabins. Each engine is entirely independent of its neighbour, and is housed in a separate water-tight compartment. Just aft of the engine-rooms is a space for the petrol-tanks, with a steel bulkhead at each end. From these tanks, which hold 375 gallons, the petrol is pumped to running tanks in the engine-rooms. Forward of the main engines is an 8-horse-power motor, which drives a dynamo, an air-compressor, and a bilge pump. The dynamo charges a battery which supplies current for general lighting, a powerful searchlight, and the cooking apparatus. Compressed air is wanted for blowing the whistle and for operating an anchor windlass and a capstan. The bilge pump keeps the bottom of the vessel clear of water; it can also be used to pump sea-water round the cylinders of the engines should the fresh-water system fail. On trials a speed of 9.75 knots was obtained. As a searching test, one of the engine-rooms was filled with water up to the cylinder-heads, the compartment between it and the boat's side being also flooded. In this condition the boat lay over to only a small extent, and was brought into port without difficulty on the other engine; moreover, the flooded engine was easily started while immersed. This lifeboat has a radius of 150 miles, and will carry 150 people. Named the *William and Kate Johnston*, she was designed by Mr R. A. Barnett, the Institution's consulting naval architect, and was built by Messrs J. Samuel White & Company, Limited, of Cowes. She was sent to her station at New Brighton *via* the east coast and the north of Scotland, and behaved well under the severe conditions of wind and sea which were encountered on the voyage.

GAS TURNED ON AND OFF BY THE KETTLE.

In few directions have greater economies been effected than in the use of gas for cooking and heating, many devices having been brought out for this purpose, some of which have been described in these columns. Among the latest is a gas-ring in which the act of putting on the kettle turns on the gas, a by-pass, of course, forming part of the equipment. The gas-ring is similar to the usual pattern, but has a central boss, through which slides a vertical steel rod with a steel button at the top. The bottom end of the rod is pivoted to a short toggle piece, the other end of which is pivoted to a horizontal rod. A wire spring passed round the pivots normally pushes up the end of the toggle and the vertical rod, so that the button stands well above the supports for the kettle. At the other end of the horizontal rod is a vertical lever pivoted in the middle. This lever passes through the air hole, and the upper end controls a spring-loaded ball-valve over the gas

inlet. When the kettle is placed on the ring, the bottom pushes down the vertical rod and straightens the toggle, the effect being to push back the horizontal rod. By these means the lower end of the lever is pushed back also, while the upper end moves forward, thus opening the ball-valve. A by-pass, of which the opening can be varied by a thumbcrew, is fitted to the gas nozzle, and a small pipe from it terminates in a tiny jet where it will best light the ring. With the device described, as soon as the kettle or a saucepan is lifted from the ring the gas is shut off, to be relit when the kettle or pan is replaced.

PILFER-PROOF PACKING-CASES.

It is a notorious fact that the pilfering of goods in transit has become rife since the war, and railway and dock companies have to meet heavy claims for losses caused in this way. A common complaint is that packing-cases have been opened and closed so neatly as to give no indication that thieves have tampered with them. It is almost an impossibility to devise a form of case that cannot be opened of which the cost is not prohibitive, but a species of fastening that, once broken, cannot be done up again is a much easier proposition. In our issue for February 1923, a wire-binder was described which provides this. Lately a method of applying steel straps in a similar manner has been invented. To do this successfully a powerful tension has to be imparted, and the ends of each strap have to be fastened with a joint which has the full strength of the strap, and which cannot be undone. The new device for imparting the tension consists of a flat steel bar with ratchet teeth on the upper side, and a powerful grip at one end to hold one part of the strap. Sliding on the bar is a similar grip (for the other end of the strap) provided with a hand-lever, which engages with the ratchet teeth and moves the second grip towards the first, tooth by tooth, with immense power. A pawl holds the grip in position when the lever is moved back to 'pick-up' the next tooth. By these means the ends of the strap are brought together for fastening, an overlap of about 2 inches being allowed. A light, flat steel tube is next slipped over these overlapping ends. A sealing-tool, which contains two punches, is then applied to the steel tube or seal. These punches are forced down by cams with long handles, the effect being to crush two square depressions through both the tube and the overlapping ends of the straps. It is claimed that this fastening is actually stronger than the strap. The steel for the straps, which is supplied in rolls of about 600 feet, varies in width from $\frac{3}{8}$ -inch to $\frac{1}{2}$ -inch, with a tensile strength of from 630 to 1260 lb. When a case is to be opened the straps are cut, and they cannot be joined again: unless, therefore, the thieves were provided with a supply of steel

and the necessary tools, they could not strap it again. The cut straps are not wasted, but are applied to smaller cases. So much extra strength is given to packing-cases by these straps that thinner wood can be used, thus effecting an appreciable saving in that direction. The straps can be applied in from 30 to 60 seconds, according to size.

TUNING THE GRAMOPHONE DISC.

A gramophone sound-box having a diaphragm of vellum with a mica centre was described in our issue for October 1921. Excellent as these diaphragms have proved, it has been found that the tension of the vellum varies slightly with the weather, as does that of all parchment drums. Means are always provided on a drum for varying the tension; and a device for the same purpose has been recently added to the gramophone sound-box by the inventor. Hitherto the tension has been obtained by clamping the edge of the parchment between two brass hoops, one being pressed tightly into the other, with the parchment between them. This arrangement will be supplemented in future by pressing a ring on the back plate against the inside face of the diaphragm, the pressure being imposed by a third hoop, which fits inside the inner clamping-hoop. Three inclined planes are cut in the back edge of this hoop. These planes engage with the ends of three screws, which pass through the clamping-hoops. By turning the hoop the inclined planes pass under the ends of the screws, and this has the effect of wedging the hoop towards the diaphragm, thus pressing the ring on the back plate against the inside edge and increasing the tension. Lugs are provided on the hoop with which to turn it, and the inclined planes are at a small enough angle for the hoop to remain where it is set. With this device the parchment can be relaxed when the instrument is out of use, and tightened when required, as is always done with drums. Different degrees of tension, according to the type of music to be rendered, can also be imposed; and this feature has proved of considerable value.

A SECURE WINDOW-FASTENER AND DOOR-BOLT.

The ordinary window-fastening gives little protection against thieves, and it cannot always be depended upon to prevent the rattling of the windows in strong winds. A new fastening has been recently brought out which cannot be forced with a knife-blade from the outside, and which clamps the two frames firmly together. The essential part of it is a barrel, through which a steel bolt is screwed. The end of this bolt projects from the barrel and terminates in a head which resembles in form that of a big wood screw without the nick for the screw-driver. A squared part at the other end of the bolt fits into a square recess in a knurled head,

which turns in an enlargement forming the corresponding end of the barrel. The complete contrivance is pivoted to, and swivels on, a stout base-plate, which is screwed to the lower frame of the window in the same position as the catch for the ordinary fastener. A hook-catch screwed to the upper frame has a recess at the back for the head of the bolt. To fasten the window when closed, the barrel is swung round on its pivot until the bolt engages with the hook-catch. The bolt is then withdrawn farther into the barrel by turning the knurled head, with the result that the bolt-head enters the bevelled recess in the back of the hook-catch, and the frames are drawn tightly together. The type of fastener just described is intended, it will be observed, for sliding sashes and flush-framed casements and doors. For recessed casements and doors a variant is provided. In this case the barrel is solid with the base-plate, and is screwed to the door. The end of the bolt, which is plain (without a head) and rounded, bears upon the lip of a hole in a plate screwed to the door-post. The barrel is not parallel with the surface of the door, but is inclined towards the edge. This feature, together with the correct placing of the plate on the door-post, causes the bolt not only to prevent the door from being opened, but to press it so closely as to prevent rattling. A key is also provided by means of which the bolt can be locked in position. Except the steel bolts, the 'business' ends of which are hardened, these fastenings are made of gun-metal with nine different types of finish, and are massive in design as compared with the old-fashioned fasteners.

A GAS FLASH-SIGN.

Owing to the keen competition between electricity and gas for lighting purposes, those interested in the one spare no efforts to equal or even excel the other in the efficiency of the devices offered to the consumer. Hitherto electricity has held the field for the flash-signs by which shopkeepers and others call attention to their wares after closing time. Lately a gas flash-sign has been devised which gives results fully equal to those from electricity, and at a lower cost. There is, of course, no difficulty in illuminating a transparent sign by gas. It is in the automatic turning on and off of the gas at regular intervals that ingenuity is required. This is done by an appliance which bears some resemblance to the old-time bellows that were used to brighten up a fire. The top and bottom of the bellows are of stout tin-plate, stamped into oval pans. Leather-covered steel strips are employed to clamp the uniting leather band to the top and bottom, and a hinge is provided at one end. The leather, which is of fine-quality Persian skin, is treated in the same manner as the leather diaphragms of gas-meters, to make it durable and gas-tight. On the top of the

bellows is a rectangular metal box, which contains a grooved rocking-arm. Pivoted in the middle, and provided with a steel ball which travels along the groove, this arm is fitted with a valve at each end that closes or opens the mouth of a gas pipe, according to which way the arm is tipped up. These two pipes are connected to the gas-supply pipe and the pipe to the burner in the flash-sign respectively by short pieces of rubber hose, so disposed that they allow the top of the bellows to rise and fall. When the bellows are 'down' the pipe to the gas-supply is open, and gas flows in, raising the top pan until the groove in the rocking-arm slants towards the hinge, when the ball runs to the other end and presses down the valve over the supply pipe, at the same time opening the pipe to the burner in the sign. The weight of the top part of the bellows, which is loaded to give the correct pressure, now forces the gas to the sign, where the burner flashes up and remains alight until the bellows have closed far enough to tip the rocking-arm the reverse way. The ball then runs along the groove, closing the pipe to the burner, and opening that from the gas-supply, and the cycle of operations is repeated. The device is contained in a neat circular metal case, fitted with two gas-taps and spigots for rubber pipes from the gas-supply and to the sign respectively. Naturally, the burner which lights up the sign is fitted with a by-pass, and this is independent of the flashing device. The sign will, therefore, begin to flash at any time if the gas is turned on. By means of a quadrant, a further movement of the bellows is made to work a revolving sign which flashes six or more distinct messages.

A NEW TYPE OF SPEED-BOAT.

No exhibit attracted more attention at a recent motor-boat show in London than a high-speed boat which in form was not unlike a fat cigar. The predominant feature of this craft is the construction, which somewhat resembles that of a Zeppelin, in that the framework consists of a series of lattice-work metal rings connected by longitudinal members. The hull is circular in section throughout, and measures 40 feet in length, with a maximum diameter of 8 feet. A form has been chosen which gives a minimum resistance to high speeds through the air, as the hull is out of water when proceeding under full power. Each ring of the frame consists of an inner and an outer ring of L-section steel, $1\frac{1}{4}$ inches wide and $\frac{1}{2}$ inch thick, with tangent spokes between the two. The flanges of the outer rings are bevelled to suit the skin of the boat, which is fastened to them. The frame rings are connected longitudinally by four 2-inch solid-drawn steel tubes, which are attached to the inner rings by aluminium brackets. At the pointed ends of the hull these tubes are held in

a gun-metal casting, to which the skin is also attached. Once this frame is completed, the attachment of the skin is a simple matter. The skin is of $\frac{1}{2}$ -inch-thick mahogany planks, each in one piece from end to end of the boat. There are two thicknesses, with oiled calico between them, the outer planks covering the joints in the inner skin. This form of hull is enormously strong, and involves only about one-third of the weight entailed by the orthodox construction with a wooden framing. In its cylindrical form it would be unstable, but to attain the high speeds aimed at, planes are required, upon which the boat skims on the 'duck and drake' principle. These planes end abruptly aft, forming steps; they give the hull a rectangular under-section where they occur, and this provides the necessary stability. As they are patched on to the planking, the strength of the circular section is not impaired. The boat shown had a plane amidships, and another near the after end. For racing, the place of these planes is taken by a series of steel plates, known as hydrofoils, upon which the boat rises right out of the water at high speeds. A light 450 horse-power petrol motor with eighteen cylinders is fitted inside the hull about amidships, being fixed to the longitudinal tubes of the framing. This engine should give a speed of 50 miles an hour to a boat fitted with planes. With hydrofoils, a speed of from 60 to 70 miles an hour is confidently expected. Access to the inside of the boat is through a big manhole, while the equipment includes a fore-hatch, rails round the upper part of the hull, and two cowl ventilators. The steersman stands on a platform below the manhole, with his head and shoulders out. It is claimed that the lightness and strength of this form of construction have special advantages for flying-boats, aeroplane-fuselages, submarines, lifeboats, racing car-bodies, amphibious cars, and fast boats for war purposes loaded with explosives and controlled by aircraft.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE ADMIRAL'S SHORE DAYS.

By G. APPLEBY TERRILL, Author of *The Museum at Night*, &c.

CHAPTER I.

I.

MY travelling-carriage was high slung and light in the wheel; and, deftly though Fred, my old postilion, drove me—and for a man who had been on shipboard till past middle life he was wonderfully deft in the saddle—we were apt to make rather a swing of it when taking a sharp corner. As we swung thus at a cross-road, the letter and the newspaper which had been lying on my knee slipped to the floor.

For a while I let them stay there—looking down presently at the newspaper. I had read it throughout; but in my idleness, and with some notion of testing how fully my vision could master small print at a distance of four feet, I read certain of its items again—the increase of the price of flour, the stealing of a jewelled fan at a playhouse, and, lastly, the piece of intelligence concerning myself which was set close beneath the date of the newspaper, November 7th, 1798:

‘It is stated on authority that the Right Honourable the Earl of Axbridge, the new Rear-Admiral of the Blue, will not hoist his flag until well into the coming year. His lordship’s health, following grave wounds sustained in the late glorious action of Aboukir Bay, is such that he is ordered to take complete rest on shore for six months at the least. His lordship’s age being not much above forty—he was born in December 1755, and succeeded to his father’s title in 1780—there happily is every reason to expect that he will be entirely recovered when the six months are passed. His lordship leaves Town this week for Bagenal, his seat in Sussex.’

In the last thirty years I had not spent above three months ashore at one time; and having long since lost interest in shore life, I should have protested very heartily against my sentence of six months of it, had it not been for the letter lying beside the newspaper. That letter, reaching me a few days ere this, had made me feel almost glad of half a year at home.

I stooped and gathered up letter and newspaper—and then I leaned back in my seat.

No. 684—VOL. XIV.

An effort I had made in stooping had done me no good. I closed my eyes during a minute, for the sight of Fred, beyond the forward window, sinking and rising to the motion of the near horse had affected me with giddiness. I drew a long breath or two, feeling that but for my stiff, newly-made, tight-buttoned, uniform coat—which replaced the sea-whitened rag I had landed in—I should be near to subsiding in a huddle. Then, careful to turn my face from Fred towards a side window, I opened my eyes. I saw that we had raised the South Downs on our beam; and the aspect of that hill range, massive and steady in the pale sunshine, began at once to dispel my qualm.

I looked at my watch. Half after one. Three o’clock should see me at Bagenal. . . . I folded my lips a trifle rigidly as I thought of the oppressive loneliness of my house when last I was there, two years back, with Joyce and Cecilia away at their school; and of the loneliness as great, three years before that, when those little daughters of mine were at home, but too young to solace me.

By now, however, Joyce was thirteen, Cecil eleven; and—I glanced to where I had laid the letter, conscious of my lips curving into a smile—and, from what their schoolmistress wrote, they would give me other matters than loneliness to think on.

I had perused this letter, in which their mistress so readily consented to send them forthwith to Bagenal for my companionship, perhaps half a score of times—perused it partly amused, partly troubled—perused it not an hour bygone. Yet now—not simply because I lacked occupation, but rather because I was still undecided as to how much reason for being uneasy the letter gave me—I picked it up and spread open its pages again, scanning, with increased smile, the list of my daughters’ misdeeds, but dwelling very thoughtfully, as hitherto, upon a subsequent paragraph. It was that paragraph which troubled me. The schoolmistress had penned it thus:

‘I am reluctant to distress your lordship further, but I feel that I must not keep from your lordship that Circumstance which underlies

[All Rights Reserved.]

JANUARY 5, 1924.

these turbulent misbehaviours and occasions me the greatest Grief and Bewilderment—namely that, although the dear children (and despite everything they *are* dear to me) have been in my care since their tend'rest years, yet my influence over them, instead of ever increasing with the passage of time, has of late Diminished Rapidly!—as has the influence of all who instruct and seek to control them. An unaccountable spirit of wilfulness has grown in the sisters; a spirit which, especially in the Lady Joyce, turns frequently into a very Flame of Rebellion, before which I stand dumfounded and well-nigh powerless. I earnestly beg that your lordship will examine this spirit for yourself, and consider whether it might be better quenched by placing the Ladies Lamont at an Academy where disciplinary measures are sterner than at my own. Should your lordship favour this course, I shall learn of it with further grief, and yet with approval, since the Ladies Lamont are become a responsibility that bears heavily upon me.'

So, to all intents, my daughters were broke—dismissed their ship. Save for regret that they had sorrowed an excellent and kindly governess, I was not over-perturbed by that. No, the actual thing that troubled me was that, unknowingly, the schoolmistress had hit a certain nearly forgotten nail very full on the head. The paragraph, the instant I saw it, had set me thinking of poor Janey's words—Janey, my wife, who died in June '88. She was paying off fast when she spoke them, and entreating me to wed again, in faint, fevered words. Poor, poor Janey!

'Some one to guard our little girls, Ben,' she had said; 'some one to guard them from themselves when they are older. . . . Remember, we're such wild blood, Ben, you and I. Remember, we were both going to shipwreck when we saw each other, and loved, and saved each other. You were going to leave the navy and pistol Commodore Hughes; then horse-racing and cards for the rest of your days. . . . And I—I was going to run off with a married play-actor—and I'd fired a hayrick the year before—swearing in fury, not caring if I was hanged. . . . Such wild blood for our little girls to have—and you away from them, at sea! . . . Ben, marry a wife who will watch them, hold them tight gripped—hold them till they love men who—will save them as you saved me.

'She must *watch, watch*—hold—*Wed her*! If not, we've—we've doomed our children, Ben. I know it!'

I had soothed Janey, even making her smile a moment by saying that such a wife as she spoke of might keep a cruel hard grip on Ben himself; and—no need to tell—I had vowed our little girls should come to no harm. I did not share Janey's forebodings, and certainly had never a thought of putting another woman in

her dear place; and having chosen my daughters' school with much care, and having had no ill report of them until this letter, I had experienced no whit of anxiety touching the future. But the case was different now.

I leaned back in my seat again, setting my hand to my chin and gazing at the houses of Lewes town, which we were approaching. 'Flame of Rebellion,' quoth the schoolmistress. 'I'd fired a hayrick, swearing in fury,' had said poor Janey of herself when sixteen. Our Joyce was thirteen. Thirteen—that was my age when I cracked a gamekeeper's head, and my father banished me to sea in the *Nireus* frigate.

I pressed my chin into my palm. Yes, it was as well I was to have them under my eye for six months—my little girls with whom I had not spent a week all told in the last five years.

II.

It was in my library at Bagenal.

I put my pipe on a corner of my *escritoire*, hitched my old brown coat—the only shore coat I possessed—straighter, and, with elbows on my papers and hands locked under my chin, surveyed the two faces on the other side of the *escritoire*—slender faces, a little flushed, dark-blue eyed and amid dark curls, one face a head above the other. I looked Joyce in the eyes, and Cecil in the eyes; and, though each looked down after an instant, I knew, with something near to dismay, that this was in graceful courtesy to me, not because my look overpowered theirs.

I sighed, not letting them hear, and pondered before speaking.

'When I came home, not a month back,' I said, 'my daughters had their arms round me before I was well out of the carriage. They kissed me—tears in their eyes, saying'—I shrugged my shoulders—"Oh, my lord, how proud we are of you!"'

Both pairs of lips in front of me moved. 'We are—very proud of you, my lord,' they whispered.

'Father,' I corrected.

'Father.'

'I was ill that day. I almost fell. My daughters' arms strained around me held me up; and their faces were full of pity for me, of longing to comfort me. And I found that their arms comforted me as nothing in this great world could have. And I felt I wanted to leave the sea service and live at home with my daughters.'

The lips did not move, the dark eyelashes were without a tremor—for one second, two, three. Then Joyce was looking at me. 'We wish you to live with us—very, very much, my lord.'

'Father,' I said gently.

'Father.'

'You wish it, child?' I said, with a show of incredulity. 'But what have you done since

that day? One piece of great naughtiness after another—you or Cecil, or the two of you together—so that I shall be forced to send you both away from me to school this week.'

I saw Joyce's eyes quiver, and Cecil's head move with a start, at that.

'Yes, you must go,' I said; 'for here, unless you are in my view, I cannot tell, day or night, what rascal mischief you are doing. I will *not* spend my time spying after you. So you must go—and leave me here lonely—very lonely, Joyce . . . Cecil.'

I pressed my lips together; and then the thought of Bagenal without them—for I meant them to go—goaded me. 'Oh, miss,' I said, looking into Joyce's eyes; 'and you, miss!'—Cecil looked at me—'I wish I'd the heart to put you to a school where they'd flog you by day and lock you to your beds by night.'

And then I regretted I had spoken thus; not so much because of the strong, sullen light of anger which had come into Joyce's eyes, as because, blended with the anger, were plain forbearance and forgiveness towards me, that touched my heart sharply.

But, in case she had seen my regret, seen that I was near to lowering my flag to her on this subject, I sternly repeated the shot, 'Yes, miss—governesses who'd give you whip and chain—'

She whispered to herself, with far deeper light in her eyes.

'What?' I asked.

'I would—kill any one, except your lordship, that whipped and chained me or Cecil.'

I hesitated. Then, since it was I who had led the child into this fierce water, I thought it right to steer her quietly out.

'I know you would never do that, sweetheart,' I said, ignoring that her lips whispered she would; 'and you know your father would never put you to such a school—eh, Cecil—eh, Joyce?'

I paused for affirmation of this. Joyce, staring down at the carpet, nodded. Cecil said under her breath, 'Yes, my lord,' and swallowed; her eyes stole round the room, to the bookshelf, to the fire, to one of my navy hats which, perpetually damp from salt, was airing on a chair before the fire. She swallowed again, and looked at me, with a swim of tears in her eyes.

'Will you—send us—to Mistress Dennis?' she asked.

'No, I shall find you a new school.' (I did not add what was in my mind—a sterner one.)

'For—Christmastide? We have never had Christmastide—or holidays, save once, with you at sea. We always live at school—' She suddenly turned her face from me and gave a little groan, and pressed her fingers over her eyes. And then she sobbed, her dark head jerking lower and lower.

What father could have stood that?

I came out of my chair, knocking my pipe from the *escritoire*, and lifted her off her feet, right up in my arms, hearing Joyce's affrighted, 'Oh, my lord, you will break your wounds!' I kissed the backs of Cecil's poor little fingers, kissed the brow above them, then settled in my chair with her arms clinging round me and her sobs against my breast. I eyed Joyce, who had picked up the pieces of my snapped pipe and stood holding them.

I was not much in mood now to go into the matters which had caused me to send for the two this morning; but I felt I could not avoid the business, and so I began. First I took the night affair—Joyce and Cecil out of the house (by way of the kitchen window) and far away in the park, in the darkness and bitter cold of three o'clock.

It was Joyce who answered me chiefly, with her head bowed to my reproaches and her fingers playing absently with the white, clay fragments of pipe—though now and again Cecil murmured under my chin. It appeared that it was not the sound of pistol-shots—as it had been on a former night, when they followed a smuggler chase for three miles—that had brought them from their beds this time. No—simply the dogs were snarling, which meant that foxes, or possibly house-breakers, were about. They had loosed the two big stable dogs, and endeavoured to follow them across the park as they chased something. In losing the dogs they had wakened Fred, who slept over the stable. Fred, trying to see them, had nearly overbalanced from his window, dropping his pistol into the water-cask. A malicious smile touched Joyce's lips as she told me that—for Fred it was who had informed against them.

For twenty minutes Joyce and I beat hither and thither in words, tacking and wearing, tacking and wearing, upon this mad night affair. She came to tears; Cecil's started afresh; but from neither did I win anything more than I usually won. They were deeply sorry they had pained me, but—for they would never lie to me—they were not sorry they had gone out. They had loved the adventure. They would try (a word which I had learnt was valueless) not to do such a thing again, but no, they would not promise; no; for if they broke a promise, it would be terrible!

I strove, as often before, to gain a promise. I bribed. Let them promise to do no more mischief, and I would not send them to school. But, though scarcely able to whisper because of the sobs which this temptation brought them to, they refused; first Joyce; then Cecil—leaving me with my bows stopped by a stone wall, as it were, and with a feeling that the refusal was plain proof of how the promise would have held them; with a feeling, too, that my daughters were not wholly unadmirable.

Though I saw no use in it, I turned to the

second misdemeanour, scarcely an hour old, before I dismissed them—the throwing to the ground of the maid Ann and the casting of her basket of linen into a just-thawed swamp hole. What was the meaning of this thing, by which Ann's wrist was well-nigh broken, and my linen spoilt?

The voice beneath my chin—Cecil's—answered, after some seconds had gone by in silence, 'Ann hoped—you'd beat us, for last night. I told Joyce to beat her.'

'I beat her,' said Joyce. She wiped a tear from her chin with her sleeve, and then stooped for a bit of the pipe which had slipped from her hand. 'I am sorry about your lordship's linen,' she said miserably.

III.

When my daughters had gone from the room, I took a new clay from a box, blew the sawdust from it, filled it with good, strong, lower deck tobacco, and lit up, my eyes going now and then while I smoked to the escritoire, on which lay the pieces of pipe that Joyce's fingers had played with for so many unhappy minutes.

I recharged and relit my pipe, and rang for Mrs McCourt, my house-stewardess of Bagenal.

'I saw some schoolgirls—young ladies, last week in the village, ma'am,' I said. 'Have we a school here now?'

'Mrs Thayer's seminary, my lord—where Sir Cort Freeland's young ladies attend, and Mr Floyer's, and quite a many more.'

'Think you Mrs Thayer would keep my two young tigers for me, yet let me have them for part of each day?' I asked.

'Indeed, yes, my lord, but——' Mrs McCourt stopped. One of her hands uneasily went adjusting her white cap, her thin curls; and she regarded me with troubled face. 'Indeed, yes, my lord, but I shouldn't sleep at night for thinking of them climbing out of top windows—and no more would your lordship, I believe. They are safer here with their kitchen window for their desperate ways.'

I nodded. And after a moment I said, 'Well, Mrs Thayer shall have them by day. If you will have the kindness, ma'am, you shall drive with them to her door of a morning and fetch them at evening. Between whiles we shall have a little rest in the house. I will arrange with Mrs Thayer this week.'

IV.

But it fell out that I did not arrange with Mrs Thayer. A very sweet gratitude on the part of Joyce and Cecil when they learned they were not to be sent from home keeping them in marvellous behaviour for several days and nights, and a letter from the Admiralty, asking me for certain information anent the harbour at Corfu, occupying much of my

attention, the school slipped from my mind until the following Sunday morning. Then, as I sat with my daughters in the village church—this being my first attendance, for hitherto I had feared to become weak and dizzy during service—the entrance of a score of young ladies, accompanied by mistresses—Mrs Thayer's seminary, I could not doubt—recalled my project to me.

I was pleased by the style of these girls as they passed by us, their chins well up, their gaze level, their pretty bonnets of silk and gauze formed in a mode that I thought would be nice for Joyce and Cecil. I liked, too, the style of the three young mistresses, slender, erect girls in buff, or gray, velvet, silk-bonneted, black scarved, and seeming, in common with their pupils, ladies to their finger-tips.

It wanted seven minutes to service time, and for a space, when Mrs Thayer's seminary was seated, I kept my eyes on silk bonnets and straight shoulders with increasing approval. And then came that which resulted in a sharp change of my school plans.

There was a sound of more young feet entering the nave, and past me came a half-dozen little girls, neatly clad, but not a velvet frock or silk bonnet among them—not a frock or bonnet that did not seem to speak of what is called 'genteel poverty.' These children were with an elderly, slight, middle-aged lady, rather set and nervous of face and dressed as humbly as themselves; and plainly this was another seminary—too small and poor to be termed a rival of Mrs Thayer's.

I noticed that the little new-comers, when almost abreast of the silk bonnets, glanced, with something of apprehension in their air, at them, and then, unmistakably, drooped their heads; while their mistress held her face markedly averted from the bonnets.

Then the Mrs Thayer bonnets turned, pretty well all at the same instant; and up, amazingly up, went the chins of the wearers, girls and mistresses alike; and the massed sneer at the half-dozen children and their governess which the action conveyed was something you would well-nigh have felt, if you had missed seeing it. More than that, it was augmented by two or three sniffs and by at least one giggle. As I watched the six children file into a long pew, with heads held low and more than one poor little cheek dyed red, I would have sworn smartly if I had not been in church.

What I did do, and on the instant, was to determine that, so sure as my name was Ben Lamont, those little children should hold their heads as high as Mrs Thayer's girls, or Mrs Thayer's mistresses either, in a very short time—if my patronage of their school could help to it.

(Continued on page 109.)

THE 'K.O.'

I.

WHENEVER a case concerning a commercial transaction in fine art comes into the Law Courts the question of Knock Outs nearly always figures more or less prominently. The judge comments with acid severity on the 'institution,' the advocate warms himself into a fine fury, and the correspondence columns of the newspapers teem with denunciations and exposures. There is no one sufficiently courageous—or indiscreet—to say a word in favour of the K.O., as it is laconically called, and those who could say much are too retiring to say, or to write, anything.

To the general public, or rather to that part of it which is particularly interested in art and literary property, either as buyers or sellers, the K.O. is a sort of secret society made up of booksellers and art dealers whose primary aim is to rob the vendor of the full value of the articles which he consigns to an auctioneer for public sale under the hammer. Any such society or combination is, *prima facie*, a conspiracy which has been declared illegal, and subject to very heavy penalties if the evil-doers could be brought to book. But the K.O. fraternity do not quarrel in public, and when, as occasionally happens, there is a row in the 'ring,' the leaders have a very effective way of punishing an objectionable member by refusing to have him in a 'settlement,' and by so running him up at public auctions that he cannot buy anything on his own account except at prices which leave him little or no margin of profit. And no disgruntled member of the K.O. has ever been such a fool as to seek redress in the Law Courts.

Briefly put, a Knock Out is a combination of two or more persons not to bid against each other at an auction sale, but to secure the articles as cheaply as possible, and then to arrange among themselves as to which of them shall have the articles purchased at the sale. Open competition is obviously the very mainspring of auction sales, and without it prices must necessarily be low and inadequate. The K.O. removes or clogs this mainspring, with more or less disastrous effects to the vendor, and to the advantage of its members. It is an auction after an auction, and is usually conducted in an upper room of a convenient inn, into which no one but members of the K.O. are admitted. The K.O. is by no means always successful in 'stalking' all its game; but the things which its nominee secures are again put up at the private auction, and competitive bids are again taken, this time the highest bidder being the actual purchaser. The sums realised over and above the prices originally paid at the public auction are thrown into a 'pool,' and at the end of the proceedings

each member of the K.O. takes his share, or 'dividend,' as I think it is called. Supposing, for instance, an article is 'knocked down' in the open market at £100, and is subsequently 'knocked out' at £200, the members of the K.O. share equally in the £100 profit. This means that the actual buyer may have paid very nearly full market value for his acquisition—for which he probably has a customer—but he also gets his share in the 'dividend': if there are only five in the K.O. he, in effect, gets the article for £180. On the other hand, the original owner is robbed of one-half of the amount he ought to have received. Against this it must be remembered that at a public sale cash has to be paid almost on the fall of the hammer, or at least within a few weeks, and the auctioneer himself has to pay his client within a month of the sale; whereas a dealer may not find a purchaser for his articles for months or even years, and has to risk the uncertainties of market values going up or down. Even at five per cent. interest a picture or a book may 'eat its head off.'

II.

It will surprise many that the person who can 'handle' an article at full market price should join a K.O. There are, doubtless, compensations and advantages not readily discernible to those outside 'the ring'; and if a few things work out at full market value, others go much below it. The more wealthy members of the K.O. are usually those who make the largest purchases, partly because they are in a larger way of business than their associates and have more channels of distribution. The K.O. may be more discriminating to-day in its selection of members, but at one time it consisted largely of 'spongers,' who had no intention or even means of buying, and were only in 'the ring' for what they could get in the way of 'dividend.'

How at least one wealthy and prominent member was cured of the K.O. was told by himself to the present writer. At a very famous sale in London of a great art collection in which were many superbly beautiful things, nearly every item was bought at much less than market value by one emissary or another of the K.O. At the subsequent 'settlement' these things were again put up, and my friend (now dead some years) found himself at the end saddled with nearly the whole of the collection, and had to pay out some thousands of pounds in the form of 'dividends' to his associates in the K.O. He was landed with a large stock of choice articles at their full market value, with the certain prospect that years must elapse before he could fully realise his investments, for snuff-boxes and such things, at anything from £500 to £1000

each, are not selling every day. This transaction—I will not repeat his picturesque descriptions of his former associates—cured my friend, and he never again joined a K.O.—not because it was unvirtuous, but because it was not good business.

The K.O. in books, pictures, old furniture, and so forth, is particularly rampant at sales in country houses. The catalogues of these sales are nearly always compiled by local auctioneers who, claiming to know everything and to be able to sell anything, are often criminally responsible for sacrificing the property of their clients. The cataloguing of books and objects of art is one which requires expert knowledge, and this cannot be acquired in a few months. The more ignorantly a sale is catalogued the better for the dealers, who have to go to view the sale and then to attend the auction. It is obvious that this costs time and money, especially to those at a distance. They are not philanthropists, and the person whose effects are being sold may never have spent a penny with them. Generally speaking, the books in country sales are of small value, but they sometimes include unexpected and undetected rarities in the way of pamphlets, which are nearly always bundled together in big 'lots.' These have to be gone through, and notes made. It is no part of the bookseller's duty to teach the auctioneer his business, and if the K.O. has a fine day it owes it to the auctioneer. The proper place for the sale of any important library—and especially of an old one—is London or some other great centre, where it can be adequately catalogued and displayed. It would not be difficult to name a dozen country libraries which have been thrown into the hands of the booksellers at their own price through the incompetence of country auctioneers who undertook tasks for which they were entirely unfitted.

But what may be almost a virtue in the country is hardly one in London, although in London, as in the country, incompetent cataloguing and the hole-and-corner places at which many auction sales are held mean a good day for the K.O. Every auctioneer in London is aware of the existence of the K.O., and is powerless to circumvent it. The dealer is his chief customer, but the market is a perfectly open one, in which any member of the public is free to bid. If the things are to be sold, and if private people do not enter into the contest, the trade is bound to be the purchaser's. The Americans and the French claim, though upon quite different grounds, that the K.O. does not exist in New York or in Paris. But I am not at all sure about this, and I have attended great sales both in Paris and in New York. It is quite true that in these cities the private collector is much more in evidence as a public buyer than in London. In New York the great picture auctions are

held in the evenings, until recently in the ball-room of one of the finest hotels in the city, and evening dress is almost *de rigueur*. It is quite a common event there for some wealthy man or woman—hitherto unknown as a collector—to turn up and purchase pictures to the tune of thousands of dollars. This kind of thing entirely knocks the bottom out of any K.O. arrangements, assuming that any such existed. Something like this happens every now and then in London. Some years ago a wealthy French commercial magnate appeared at a great sale in London, and bought a magnificent Gainsborough portrait for many thousands of pounds in the teeth of all the London dealers. He paid a big deposit in £1000 Bank of England notes, and then went for a 'blow' on the Thames in one of the County Council steamers; his identity was not revealed until his death a few years since. All vendors cannot hope for such an apparition at their sales, and so, in spite of occasional surprises, unpleasant to the K.O., the dealers have things pretty much their own way.

In Paris, as is well known, practically all the auction sales, from the finest collections of pictures to the 'junk' from all sorts of quarters, are held at the Hôtel de Ventés in the Rue Drouot. The auction profession there is a very close corporation—and not as in England a mere matter of paying for a licence—and every sale is engineered by the 'expert' who makes the catalogue, and the *commissaire-priseur* who 'cries' the sale. Auctions are going on concurrently in half-a-dozen or more rooms. The collector or dealer of books, prints, postage-stamps, pictures, and the thousand and one other things which are collected may follow up his prey all day long under the one roof. The 'expert' sees to it that everything is properly catalogued, and the bargain-hunter does not have a great many chances. That bargains have been picked up in the Rue Drouot there can be no doubt, but any combination such as our K.O. would be difficult. The Hôtel de Ventés is in the centre of Paris, and to the collector all roads lead to the Rue Drouot. But it must be pointed out that in both Paris and New York the auction charges are far higher than they are in England, and often run to thirty per cent. From which the cynic might be tempted to say that if the K.O. does not rob the vendor, the auctioneer does!

III.

The obvious remedy against the K.O. is reserves. At the greatest of New York art auction rooms, reserves on the part of the vendors, except in very special cases, are not allowed, and practically everything is sold to the highest bidder. Vendors have found more than one way of getting over this, and of preventing their property being given away for

next to nothing. The danger of reserves at London auctions is that they may not be reached, and the owner has to pay for the buying in of things which, once out of his house, he does not any longer want. To get a friend to 'run it up' to within a definite limit is always a dangerous expedient, because if the friend purchases the article for the owner, the latter has to pay full commission, just as if a genuine sale had been effected. At the best, a sale with reserves is rarely more than a moderate success, and more often than not a distinct 'frost.' The frequenter of London sale-rooms very quickly discerns whether the auctioneer is receiving genuine bids or whether the bidding is on behalf of the vendor. In the latter case the would-be buyer develops what the Americans call 'cold feet,' and drops out of the contest.

Owners nearly always regard their geese as swans, and by placing unduly high reserves on their property, they are not so much defeating the K.O. as damaging their own property. Reserves are safe only when they are reasonably low. It is obviously the auctioneer's duty to his client, and it is to his own interest to obtain the highest possible price for the wares he offers, but if he is fettered with unreasonably high reserves, the chances are not in favour of his success. Some things will fetch much more than had been expected and others much less, as I have experienced on many occasions.

Various means have been formulated for cir-

cumventing the K.O., but the fact is it can neither be suppressed nor prosecuted. The composition of each 'ring' is nearly always different both as to number and as to individuals. You cannot prosecute an abstract idea, any more than you can prosecute a community as such. That the K.O. has robbed the fatherless and the widow, that it is an iniquitous system with very little in its favour and much against it, there can be no question; but it is one of those evils which will elude all attempts to suppress them. Dealers in art and books are not in business for philanthropic purposes. They are out to buy in the cheapest market, and to sell at the highest possible price. They make bad purchases even in the K.O., and often find themselves burdened with things known as 'stickers'—things for which they confidently expected a ready sale, but which prove to be additional dead stock.

The K.O. has had its disappointments as well as its successes. Probably the greatest shock it ever sustained was when one of its members cleared a lot in 'the ring' at about £10, and discovered when he got it home that it contained a copy of one of the rarest pamphlets in English literature, which he quickly sold for over £1000. In this case it was a question not of 'sharing out,' but of one man 'sharing in' with the whole of the plunder. The original vendor got about £3 for the 'lot,' and the K.O. hardly enough to pay for a day trip to Margate and back.

A GIPSY OF THE NORTH.

By OTTWELL BINNS, Author of *A Mating in the Wilds*, *A Hazard of the Snows*, *Clancy of the Mounted Police*, &c.

CHAPTER V.—continued.

A MOMENT afterwards Carwyke changed the subject. 'Do you suppose that Standifer is following us?' he asked Billy.

'Yep! He ain't ther sort to give up on ther first lap. He'd maybe drive past ther mouth of ther river first go-off, but when he found we wasn't up ther coast he'd guess; an' I'll wager he's coming this way now. He ain't ther breed to be easily foxed. If we can't keep well ahead of him, we'll hear of him inside a week, sure.'

Carwyke considered a moment ere he said, 'This river seems to be taking us almost due south.'

'Sou'-east, I should say. Comes from some mountains down this way, I once heard an old Eskimo tell; but I dunno any more than thet, nor whether it's true either.'

'It probably is. Eskimo tradition is often reliable. That means that we may be making towards the Noatak and the Baird Mountains, in which case we might swing west and make Kotzebue Sound.'

'It's all one to me, so long as we get Miss Norma away from Standifer.'

'Oh, we've just got to do that,' answered Carwyke emphatically.

'Then it's time one of us was a-turnin' in, for we'll have to get away pretty soon. I'll take first watch if yo' like.'

'No, I'll take that. I'm not in the least sleepy at present.'

'Then I'll go to by-by. There's one good thing thet comes from havin' been a sailor-man—I can go to sleep any time when it's my watch below.'

Without more ado Billy wrapped himself in a blanket, carefully covering his head, and within five minutes his snores proved that his last words had been no idle boast.

Carwyke, left to himself, finding the mosquitoes troublesome, threw an armful of moss upon the fire to increase the smoke of the smudge, then after a single comprehensive glance across the dreary landscape and up and

down the silent reaches of the river, fell into meditation. From time to time as he sat there he glanced towards the sleeping girl, those glances revealing the subject of his thoughts. Once he whispered to himself, 'Mannering must have been a madman or a fanatic to let her take the risks!'

A sound arrested his attention a moment afterwards, and he looked hastily round. Half-a-dozen caribou had appeared, seemingly from nowhere, and were standing staring at the smudge with wondering eyes. He watched them for a moment, then waved his hand. The beasts trotted away across the tundra, but presently halted, and with the curiosity of their kind resumed their contemplation of a phenomenon that was probably entirely new in their experience.

Once more he fell into thought. How had Mannering lived during those years at Unapik? Had he lived on the resources of the land and sea as the Eskimo lived; or had he private resources which enabled him to purchase what he required from the trading-post at Icy Cape, which he had visited twice a year? The latter seemed to him the likelier alternative, the fact of the missionary receiving books and papers from the outside inclining him strongly to that idea. In that case the girl must be heiress to some competency which, whether small or large, would enable her to live. When they reached civilisation he must somehow find where her father's means came from, and so secure her rights.

So, thinking first one thing then another, but all his thoughts centring round the sleeping girl, he passed the time of his watch uneventfully. At the end of a couple of hours he wakened the snoring Billy to take his place, and himself promptly slipped into slumber, from which he did not waken until the ex-whaler shook him and announced that breakfast was ready.

The girl was already awake, seated in the drift of the smoke and just finishing the plaiting of her long golden hair. She looked up as he rose and stretched himself. Her blue eyes were radiant, her face was aglow after a wash in the cold river water, and a smile played around her mouth as she gave him greeting. 'Good morning, Mr Carwyke. I hope you have slept well.'

'Like a bear!' he answered back with a laugh; then, stretching his arms again, added, 'But I'm frightfully stiff.'

'That is the paddling, and the sitting in the kayak,' she answered, laughing back as she threw the finished plait over her shoulder. 'You are not used to such work, but in a day or two it will wear off.'

So he sat upright and stared across the river without speaking; and she, looking at her, felt his heart

quicken, and a glowing light of admiration came into his eyes of which he was entirely unaware. At that moment something—the intensity of his gaze perhaps—caused the girl to look at him, and their eyes met. As they did so a deep flush surged in Norma Mannering's face, and a second later her gaze once more sought the tundra, though the flush deepened. Neither of them spoke; but as Roy Carwyke began to walk up-river to make his morning toilet his heart was beating quicker, and as he trod the soggy moss there was a spring in his step, and he hummed to himself the lines of an old chanson of the woodcutters:

Here shall I build my cedar house,
A city with gates, a road to the sea—
For I am Lord of the Earth—

He broke off, looked back over his shoulder to where Norma Mannering stood with her hair gleaming like gold in the sunshine, then gave a laugh of pleasure. 'Lord of the Earth!' he gibed at himself. 'To be lord of one woman's heart is a better thing.'

Then he began to hum the catch over again:

Here shall I build my cedar house,
A city with gates, a road to the sea—
For I am Lord of the Earth!
Hew! Hew!

CHAPTER VI.—OVER THE HEIGHT OF LAND.

BREAKFAST over, the fugitives resumed their journey up the river, and paddled on without incident until noonday, when to escape the pestering mosquitoes they landed and made a smudge whilst they ate their midday meal. There was still no sign of any pursuers, and Carwyke was inclined to think that Standifer and his companions had not followed them up the river.

'Don't yo' b'lieve thet, Mista Carwyke, urged Billy earnestly. 'Standifer's of the sticking sort, an' he ain't givin' up Miss Norma without a kick. He ain't visible yet; but I'll swear he's tearing ther water behind us, or else marching across ther moss to intercept us.'

'Across the moss!' cried Carwyke, startled at the thought.

'Yep; yo'll have noticed that this yere river winds about a goodish bit, an' thet we waste time takin' long bends. If Standifer knows thet, it might strike him thet he'd save time by taking a bee-line across ther tundra and meetin' us farther up.'

'Then I hope he doesn't know it,' answered Carwyke, staring across the waste of moss and dwarf trees.

'There's one comfort, we're bound to get sight of ther fellows if thet's their game, unless they keep to ther hollows, an' in thet case they can't go straight, an' we'll beat 'em at any point they may be making for; thet is, if we don't strike a lot of broken water, an' ther current don't get no faster than it is at present.'

The ex-whaler's words, however well-meaning, brought little assurance to Roy Carwyke. He felt that as they progressed up the river the great was bound to quicken, and that it was a certainty that more broken water would be encountered. When they resumed their journey he was conscious of a mounting anxiety; and towards the end of the day they reached a portaged round three long rapids, his eyes returned to the tundra instead of the river, no sign of pursuers. He saw none. Once again he caught sight of small herds of reindeer, but these, with the wild geese and waterfowl that made the waste their breeding-grounds, were the only sentient things in the waste; and when they pitched camp for the night his anxiety began to wane.

At the end of the third day it was completely clear. It was inconceivable that, barring accident, Standifer could overtake them now, and on the fourth morning they resumed their journey in a sweeping rain blown across the tundra in spite of the discomfort his heart was in. The pursuit, if pursuit there was, must be abandoned, and the way ahead was surely clear.

Through the veil of the rain he noticed that the character of the country was slowly changing. The banks of the river were growing higher, the dwarf spruce and willows less thick; and once, as the rain broke and the sun shone clear, through the rainbows he thought he could perceive a line of distant hills. Billy declared that what he saw was no more than a low bank of cloud, and the girl shared his view; but Carwyke clung to his conviction. The tundra itself was less broken and undulating, and now as he looked across it southward it seemed to rise upward towards the skyline, proving that they were moving towards the Height of Land.

That evening when they camped Carwyke was full with anticipation of the coming change. In two days, three at most, they would have left the dreary waste behind them, and be passing through the changeful scenery of the mountains. Walking on the tundra with Norma to his left, the stiffness from their limbs, he expressed much to the girl, who replied laughingly, 'Do you know, Mr Carwyke, I have never seen a mountain!'

He stared at her in amazement, and before he could answer the girl spoke again. 'I have seen pictures in my father's books, but all my life I have lived at Unapik; and I have never been anywhere else, except when the tribe migrated to the hunting-grounds. I have never been away, and had never seen half a score of white men together until that ship sailed into the bay.' 'How old are you?' he asked abruptly.

'Nearly eighteen,' she answered wonderingly. 'Why do you ask?'

He did not immediately answer. For a moment he visioned the bleakness of her life,

enviored by the misty sea on one side and the barren waste on the other. He thought of the wilderness as it was now in the hour of its freedom—a soggy waste of moss starred with flowers and varied by dwarfed spruce and birch, the home of the caribou, the haunt of white wolves and arctic foxes and migrating birds. Then he visioned it as it was in winter, a mere howling waste of snow, the home of the blizzard, swept by unceasing and bitter winds, and as he did so he cried, 'Eighteen years of this! For you! Great Scott, what was your father thinking of?'

The girl looked at him in surprise, and then answered, 'He meant me to help him with his work. For two years I have been teaching the children, when there was opportunity. You know Eskimo children all help in the work of the camp, and really there was not so much time as you might think for that kind of thing.'

'What did you teach them?' he asked curiously.

'Oh, how to read their own language; and stories from the Bible. They are very fond of stories, you know, and it is easy to teach them that way.'

He looked at her, saw her in all her radiant fairness, and his heart rebelled at what he considered the waste of her youth.

'Your father ought to have known better,' he said sharply. 'It was not fair to keep you up here. He ought to have sent you south to your own kind.'

'But I was very happy,' she said—'until my father was lost.'

'Perhaps!' he answered. 'But life owes you a great deal for those lost years of your youth—and it may yet liquidate the debt.'

'If my father came back——' began the girl, and broke off without finishing the sentence.

'I am afraid there is little hope of that,' he said quietly. 'Three years is a long time; and if he had been picked up from the floe, he must long ago have found his way back to Unapik and you.'

'Yes!' answered Norma, with a little quiver in her voice; 'I fear it is so.'

'And you will be wise to order your life as if your father had indeed passed out of it.'

'But——' A look of apprehension came on the beautiful face, and the thought that had occasioned it was not spoken.

'But what?' he asked quickly.

She waved her hand southward. 'The great strange world to which you are taking me! What shall I do there? I know no life but that of Unapik. Oh, I . . . I am afraid!'

As he looked at her distressed and beautiful face, his heart went out to her. He took a quick step forward, hot words upon his lips; then, remembering her helplessness, he checked them, and said quietly, 'Please do not distress yourself on that score, Miss Norma. We are not yet out of the wilderness, you know, and it

will be many weeks before you have to face the thing you fear. And when that time comes you will find your place, I am sure of that.'

'You think so?' she asked yearningly, as one clutching at comfort.

'Yes!' he answered emphatically.

'That was my father's faith,' replied the girl, her face clearing a little. '"Each of us has his niche," he used to say. And perhaps I shall find mine. And I shall have you to help me, for you are my friend.'

'Friend!' For a moment he was tempted to repudiate the word, to tell her the thoughts that had been in his mind in the last day or two, and that had clamoured for expression a minute before; but again he put the bridle on his tongue, and answered only, 'I would do anything to serve you!'

'You have already proved that,' cried Norma impulsively. 'You have risked your life, and incurred the enmity of that man Standifer, and if he overtakes us—'

'He won't!' broke in Carwyke confidently. 'We are too far ahead of him now. Soon we shall be in country that I know, where he is

scarcely likely to follow us. And in any case I am not afraid of Standifer.'

'But if he overtakes us—what will you do?'

'Shoot him as I would a wolf! I should be justified for your sake, and for my own. Remember, he has already attempted my life.'

The girl looked at him with a tender light in her blue eyes, and then with a quite unusual shyness said, 'I should not like anything to happen to you—because of me.'

His own eyes kindled as he read the solicitude in hers, and again he was tempted to take advantage of the moment. He saw her face flush rosily under the ardour of his gaze, and she looked hastily away; and again he repressed his surging emotion. At all costs he felt that he must not lose her confidence, or jeopardise the future by taking advantage of her dependence upon him. He forced himself to laugh with assumed carelessness.

'That is not in the least likely. I am well able to take care of myself, Miss Norma, so do not worry on my account. But there is Billy signalling to us. Supper must be ready.'

(Continued on page 100.)

SMUGGLING ON THE CLYDE.

By JOHN DONALD, Author of *Old Greenock Characters*, &c.

I.

DEEP discontent disquieted the people of Scotland after the Union of the English and Scottish Parliaments in 1707 through, *inter alia*, the imposition of numerous new import duties, because, before the Union, Scottish Customs exactions had been comparatively few; and the resentment of the masses was aroused by an unwise prohibition of the importation of certain foodstuffs at a time when the limited agricultural outcome of their own country was insufficient for their needs. The exclusion of foreign produce (which then included Irish goods), such as butter, cheese, and beef, raised the prices of food, and bore hardly on the poorer classes. A petition had been presented to the Scottish Parliament urging 'that all acts and impositions made and imposed for restraining and inbringing of victual may be discharged, it being without example in any part of the world, and so much the more that the whole Sherifdoms of Dumbarton and Renfrew are not able to sustain themselves in the most plentiful years that ever fell out without supplies from foreign ports.' The prayer of that petition was not granted. On the contrary, as already stated, additional duties were imposed (after the Union), and smuggling became rampant. Indeed, it has been said that at that time the value of smuggled goods exceeded the value of duty-paid imports.

Although this extensive traffic was per-

sistently carried on under the very noses of the preventive officers, it was exceedingly difficult to detect the smugglers; for our seaboard populace (many of whom knew when a cargo was to be 'run') regarded the evasion of duty-payment as venial, and connived at, where they did not actively assist in, the operations of the 'free-traders.' Landed proprietors whose mansions were in proximity to the shore were not averse from receiving a substantial and inexpensive addition to their stocks of brandies, wines, tea, and tobacco, a fine piece of silk to make a gown for my lady, or a dainty lace frill to trim it withal—yet they detested poachers!

These 'runs' were generally organised and financed by the smugglers themselves, but they sometimes received from their consignees what was termed 'venture-money'—that is, part-payment in advance for the value of the goods, the balance being payable on delivery. Obviously, prompt payment to and by the smuggler, whether in cash or in kind, was imperative.

The utmost despatch was necessary in disposing of a consignment, even in favourable circumstances (as when no preventive officers were about), and in populated districts there was no lack of willing hands—male and female. On 9th July 1717 no fewer than thirteen otherwise respectable women deforced Robert Cochran, a surveyor of H.M. Customs, while in the performance of his duty at Port-Glasgow. The officer had seized several casks of smuggled

brandy in the stable of William Stirrat, a merchant (the term 'merchant' had a more general application then than now, and included small shopkeepers, such as grocers, drapers, and even hucksters), and the ladies, in turn, seized the officer, carried him off, and held him in detention until their male accomplices had removed the liquor to a place of concealment. Two men, Stirrat and one John Taylor, were convicted for their share in the matter, and absconded to evade payment of the fines imposed; while each of the women was penalised to the extent of five pounds sterling, the husbands (described as merchants, horse-hirers, fleshers, and masons) of the married women being rendered liable for payment of the penalties.

Encounters between smugglers and Revenue officers did not always end so innocuously. An officer named Hugh M'Lachlan, on watch-duty near the Cloch Point, observed a boat putting off from the shore, apparently with the intention of meeting the incoming ship *Blackgrove*, bound for Greenock. After hastily summoning his colleagues in the neighbourhood, M'Lachlan continued to watch the actions of the suspected parties. It was evident that some one on the ship expected the shore-boat, for as soon as it got alongside a short parley was followed by the transference to the boat of a number of bundles or cases. That was sufficient for the watcher, and, his fellow-officers having come up, he and nine others put off in a boat to intercept the smugglers. They met them about a hundred yards from the shore.

'Hallo! Stop there!' shouted the officer in charge.

'Why should we?' came back the reply.

'We are Customs officers, and demand to know what you have on that boat.'

No response was made, and as the men continued to row smartly landwards, the Revenue boat turned and followed in pursuit. Both boats reached the beach about the same time. Most of the Revenue officers leaped ashore and made a dash for the smugglers' boat, only to find themselves confronted by its late occupants, reinforced by a number of comrades who had remained ashore. The 'free-traders' were determined not to relinquish the smuggled goods, and equally resolved that they themselves should not be taken. They were armed with sticks and stones, which they used so freely that at their first onslaught several officers fell, more or less injured. 'Have at them, boys!' shouted one of the smugglers, and a desperate hand-to-hand struggle followed. The 'hounds' (as the Custom-house officers were called) fought gamely; but the greater force prevailed, and in a short time the Revenue men were either routed or disabled, while the victors lost no time in getting into their boat and off to a quieter retreat for the landing of their gear. The result of the affray was serious. M'Lachlan had been killed outright,

another officer had his arm broken, and all the others bore some mark of the fight. A criminal prosecution was at once instituted against the parties implicated, who were known to the officers. It was a hanging matter, and the offenders, realising this, disappeared without leaving a trace, except two men who were too old to have taken any active part in the conflict, and against whom proceedings were dropped.

II.

Apart from Irish produce and a comparatively small quantity of illicitly distilled whisky from the Highlands, cargoes of wines, brandies, and dress-stuffs were 'run' in, chiefly from France and Spain, and rum, brandy, and tobacco from our American colonies and the West Indies. About 1720, tea was added to the list of uncustomed commodities. By means of trading-stations at Ostend and Gothenburg, that favourite beverage was sold on the Continent at a price within the reach of even the poorest classes. The price of the duty-paid article in Britain was, generally, prohibitive, and the 'free-trader' seized his opportunity. The result was, as stated by a writer in 1722, that in this country 'Tea is become the common breakfast of all sorts of people—blue-gowns and fish-carriers among the lave—and, in consequence, the decay of the brewery is immense.' (Readers of Scott need not be reminded that beer preceded tea as the breakfast beverage.)

The evil influence of the illegal commerce was more than commensurate with its extent. Observant and thoughtful men noted its debasing effects on both communities and individuals, and protests were fulminated by writers and preachers. In a letter addressed, within twenty years after the Union, to the Convention of Royal Burghs it is stated: 'The smuggler was the favourite. The prohibited or high-duty goods were run ashore by the boats of whatever part of the coast he came near. When ashore, they were guarded by the country people from the Custom-house officers; when seized, they were in most cases rescued; and when a seizure did take place and the guilty persons were captured, the juries nearly in every instance found a verdict for the defenders.'

An interesting sidelight on the effects of the smuggling trade on the Ayrshire coast is given by John Galt in *The Annals of the Parish*, where the Rev. Micah Balwhidder quaintly records: 'It was in this year' (1761) 'that the great smuggling trade corrupted all the west coast, especially the laigh lands about the Troon and the Loans. The tea was going like the chaff, and the wastrie of all things was terrible. There was nothing minded but the riding of cadgers by day and excisemen by night—and battles between the smugglers and the king's men, both by sea and land. There was a continual drunkenness and debauchery;

and our session, that was but on the lip of this whirlpool of iniquity, had an awful time o't. I did all that was in the power of nature to keep my people from the contagion: I preached sixteen times from the text, "Render unto Cæsar the things that are Cæsar's." I visited, and I exhorted; I warned, and I prophesied; I told them that although money came in like slate stones, it would go like snow off the dyke. But for all I could do, the evil got in among us. . . . The annalist then proceeds to detail certain effects of the iniquitous traffic upon the morals of his parishioners, including, among more deplorable incidents, the spread of tea-drinking, and the institution of a dancing-school 'in the genteelest fashion, in the mode of Paris.'

By the way, it is amusing to note that just a year later the reverend gentleman writes: '... although I could never abide the smuggling, both on its own account and the evils that grew therefrom to the countryside, I lost some of my dislike to the tea after Mrs Malcolm' (a deserving widow) 'began to traffic in it, and we then had it for our breakfast in the morning at the Manse, as well as in the afternoon. But what I thought most of it was, that it did no harm to the head of drinkers, which was not always the case with the possets that were in fashion before . . . so both for its temperance and on account of Mrs Malcolm's sale, I refrained from the November in this year to preach against tea; but' (he naively adds) 'I never lifted the weight of my displeasure from off the smuggling trade.'

The smuggler had small respect for the church; its sacred buildings were not immune from desecration by him. It is recorded in the Register of Session of Greenock that on 17th September 1784 the 'beddal' of the kirk was dismissed from his office for having, among other offences, neglected his duties by allowing the windows of the kirk to be broken and stolen (that is, smuggled) goods lodged in it. The church here referred to is, by the way, the now famous 'Old West Kirk,' within whose kirkyard reposed until recently the remains of Burns's Highland Mary, which still holds the dust of James Watt's parents, John Wilson the poet (author of *The Clyde*), and other notable persons. The church was not far from the beach, and the mouth of the Kirk Burn (now the West Burn) near by, then used as a harbour for fishing-smacks, doubtless also sheltered smuggling craft.

About this time the 'private stills' of the Highlands provided occasional small freights for 'free-traders.' From various points in the shires of Argyll and Dumbarton the usquebaugh was conveyed over rough roads and no roads to Garelochhead or the Cowal shore, whence it was stealthily ferried across the firth. Much of the liquor shipped from Garelochhead was

distilled in the neighbourhood, and one of the 'Black M'Kinlays,' known as 'Jock the Whaul' (Whale), was a leading spirit in the adventures.

A marvellous success attended these smugglers; but on at least one occasion they ran into 'the lion's mouth.' An old collector of Customs, residing close by the shore at the west end of Greenock in the beginning of last century, was one night awakened by an unusual sound of oars. He at once got up to investigate. Peering from the window, he saw (for the night was fairly clear) a boat with four or five men and a considerable number of kegs on board. Without thought of danger the men ran the boat onto the beach with a loud grating noise, and, having made it fast, quite leisurely proceeded to land the cargo. Meanwhile the old gentleman, amazed at their temerity, and indignant at their extraordinary impudence, hastily summoned assistance, and before the unsuspecting duty-dodgers had completed arrangements for the removal of the booty they were pounced upon.

A hundred and twenty years ago the bold contrabandist, attired in an easy-fitting half-sailor, half-pirate costume, with the traditional waistcloth, hanger, and pistols, formed a striking figure, around whom lingered an air of gallantry and romance. Napoleon I. is said not only to have encouraged smugglers but, by utilising their larger craft as privateers, almost raised the illegal traffic to the dignity of warfare. Indeed, the successful smuggler on a large scale was generally (although not by Revenue officials) regarded as quite a respectable person. Even Sir Walter Scott, sheriff though he was, betrays a lurking kindness for Dirk Hatteraick; while Gilbert Glossin is presented as an object of contempt.

But with the removal of most of the prohibitive duties on imports to Britain passed the smuggler in his glory. For many years his numerous successors, in common garb, have been more than satisfied to conceal small quantities of dutiable goods in remote recesses of steam-driven 'tramps,' and to sneak ashore with the booty when the Custom-house officer's back is turned. There have been exceptions, of course, as we shall see presently in the case of the steamer *Ovington*. Meanwhile, it may be interesting to state how some of the petty smugglers accomplished their end. An old salt of the writer's acquaintance usually sewed his plugs of tobacco—sometimes as many as eighty-four, equal to 7 lb.—inside a coarse blue shirt, which he donned as a working garment immediately before the arrival of the Revenue officers; and he chuckled as he told how he had outwitted the 'hounds' by scooping out the contents of two cork fenders and restuffing them with plugs of tobacco. These fenders lay on the deck, and were repeatedly passed, and actually kicked, by the unsuspecting officials.

At the conclusion of a business conversation in the cabin of a newly arrived vessel the captain informed a shipping-clerk that he had a box of prime cigars for him from a friend in Havana, which would require to be taken care of privily, as they had not been entered in the list of cargo. The clerk thanked the captain, but said he would rather pay the duty and run the risk of smuggling them. However, the shipmaster produced the box, which was wrapped up in brown paper fastened with string, and the clerk departed with the parcel swinging from his hand. He made no attempt to conceal it. Just as he stepped off the gangway he was confronted by a Customs official newly on the job and unknown to him. 'What have you got there?' demanded the officer.—'A box of cigars,' frankly answered the young fellow, with a smile. The other seized him up and down disdainfully and passed off, his head in the air; while the excited clerk, with his choice Havanas, smiled jauntily up the quay whistling 'The Lassawa wi' the exciseman.'

III.

Some forty years ago the Customs officials at Greenock became aware that considerable quantities of tobacco and cigars were being consumed in the town which, to use an old phrase, 'had never paid the Queen.' Local seaporters protested against the unfair trade, and a private, but thorough, investigation was conducted, the result of which was that strong suspicion rested upon the crews of steamers carrying raw beetroot-sugar from Hamburg to Greenock for refining. The vessels were closely watched for a considerable time, but no discovery of importance ensued; and the authorities at headquarters, whose confidence in the diligence and efficiency of the local officers appears to have been weakened, determined upon direct action. In the afternoon in the month of May 1886 three gentlemen wearing ulster-coats, and each with a carpet-bag, perambulated the wharf at the East India Harbour. They looked like commercial travellers, and were supposed to be waiting for one of the Irish boats. About half-past seven the s.s. *Dresden* from Hamburg was sighted, and, before the mooring-ropes were cast, the three men, to the surprise of the dockers, jumped on board, threw off their outer garments, opened their carpet-bags, and donned the uniforms of Custom-house officers. Two of them quickly disappeared, one into the cabin, the other into the fore-castle, while the third remained to watch on deck. They had been sent from London specially to search this ship, and the outcome was that about 30 lb. of tobacco were found hidden away, mostly in the main locker. No owner could be found for the stuff; but it transpired that during the search one of the crew went ashore, ostensibly to

report at the police office the loss of a watch which, he alleged, had been stolen from him on the voyage, and—he did not come back! However, a fireman was next day convicted of having smuggled over 5 lb. of tobacco, and fined £2, 14s. 6d. and expenses.

It will not be supposed that the Greenock Custom-house officers felt complimented by the advent of their Metropolitan confrères, and perhaps they were not unduly cast down at the meagreness of the result. Be that as it may, after the departure of the London men, and in spite of increased vigilance on the part of the local officers, the illicit game went merrily on. It became evident that organised smuggling was extensively carried on by the collusion of persons ashore with others on board ship, and that the small quantities of tobacco seized from time to time had no connection with the organised traffic; but it was not until nearly two years after the *Dresden* incident, and then only through an informer, that the Revenue officers learned the secret of the operations which had so long baffled them, and which were now to lead to the greatest Customs seizure for many years. Their information was that from the incoming s.s. *Ovington*, a Hamburg trader, there would be dropped opposite Lunderston Bay (a mile or so below the Cloch Lighthouse) a considerable quantity of tobacco made up in bales or parcels, each having attached a rope and buoy or float to indicate its situation to confederates from the shore, who were to uplift it.

It may not be inappropriate to relate here as an amusing episode an incident which occurred before the Revenue officials became aware of the smugglers' methods. The latter, to obviate a long land journey, were in the habit of dropping the bales overboard opposite Fort Matilda, or at an agreed-on spot off the Esplanade as far up, even, as Princes Pier, and at a time when two men were grappling for the sunken contraband a Customs boat swung suddenly round the pier corner, so startling the trawlers that they jumped into the water. The officers, who thought an ordinary accident had happened, soon had the men out and back into their boat, after which they proceeded on their way. It was only in the light of subsequent events that they realised what the men had been about. That fright warned the smugglers, and thereafter they jettisoned their goods farther down the firth.

But to return. The coastguard at Inverkip had been informed; the *Ovington* had passed up the river, and, in the early hours of the 27th March 1888, three officers kept a look-out from a hiding-place on the shore. By-and-by a boat with two or three men put out and disappeared in the darkness. The watchers waited patiently, and their confidence in a successful issue of the vigil was confirmed by the appearance, on the road leading from Greenock, of a cab, which stopped almost opposite the point whence the

boat had set out. After an absence of about two hours the boat returned, and, a careful survey of the district disclosing nothing of a hostile nature, the smugglers proceeded confidently, even cheerfully, to transfer a considerable number of cases from the boat to the cab. Their satisfaction was short-lived. Just as they were about to start on the homeward journey the officers leapt from their ambuscade and called upon them, in the Queen's name, to surrender. The driver whipped up his horse and made off, but the reports of two blank cartridges fired by the officers induced him to stop. The smugglers showed fight and a scrimmage ensued, in the course of which two of them escaped. The cabman and a man named Walker, who subsequently proved to be the leading spirit of the illegal enterprise, were secured, and, with the horse and cab and about 300 lb. of tobacco, taken to Greenock.

Walker, who was employed as coachman by a gentleman in the west end of Greenock, was a man of varied interests; for, apart from his adventures in contraband, he managed, in his spare time, to attend sales by auction, and subsequently to retail his purchases of easily portable goods, such as watches and articles of jewellery, to shopkeepers, individuals of his acquaintance, and others. He was suspected of having concealed a considerable quantity of

smuggled tobacco in or about the stable where he was employed and his adjacent dwelling-house; and in consequence, while their colleagues were engaged near Lunderston Bay, a party of seven Custom-house officers raided the premises, and discovered in various hiding-places parcels of tobacco amounting in all to about 800 lb. The total quantity seized was afterwards ascertained to be 1095 lb.

The horse and cab were declared forfeited, and ordered to be sold, notwithstanding the owner's protest that they had been hired from him in the ordinary way of business, and that he knew absolutely nothing of any illicit traffic.

The steamer *Ovington* was allowed to proceed on another voyage, after the deposit of a £300 bail-bond. On her return the mate was arrested for complicity in the affair, and he, along with Walker and the cabman, was, on 30th May 1888, brought to trial before Lord Fraser in the Exchequer Court of the Court of Session. The mate and the cabman were found not guilty of the charges brought against them; but Walker was convicted of removing and knowingly harbouring uncustomed goods, and mulcted in penalties amounting to £831, with £25 of modified expenses, on default in payment of which he was sent to prison for twelve months.

So ended the last important instance of smuggling on the Clyde.

'THERE SHE BLOWS.'

NETTING WHALES IN NEW ZEALAND.

By D. W. O. FAGAN.

I.

COURTEOUSLY I advise the engineer to 'tell it to the marines,' and frankly refuse to believe. 'Catch a sixty-foot whale in a net? Nonsense! D'you take me for an idiot?'

'Man,' says M'Gill, 'I tak ye for a misdootful ignoramus. Come an' see for yoursel'. Ma leave's up the morn, an' we'll gang thegither.'

Why not? I argue. There is nothing urgent on hand. At least the visit should be productive of 'copy.'

And that is how I come to find myself at Wangamumu (North Auckland) to see the whales caught in nets, and to learn the manner of it and other things.

II.

The talk is of whales; of fierce fights in wide sea-spaces; of 'sperms,' of 'killers,' of Poleward-faring whale schools taking the age-long track that brings them in touch of Cape Brett; of bulls and cows poking inquisitive noses inshore to have a look, and paying for their curiosity with their lives. And so, after a good-night

tot of the rum that has never paid duty, I 'turn in' in the spare bunk, with injunctions to 'keep an eye lifting' for an early call. Ten minutes I am asleep—no more—when 'Whale ho!' rings from the 'look-outs' on the cliff-head. Like the 'huers' of the Cornish coast who watch for the coming of the pilchard, these men scan the sea-face night and day for signs of 'fish.'

'There she blows!' Crews are at their stations in the long, light whale-boats; harpooner and lance-man test their weapons, and look to the mechanism of the harpoon-guns; boat-steerers try the swing of the great steer-oars in the stern-grummets.

'Tumble in, all hands!'

Steam is up aboard the launch, and we put out across the still water. M'Gill's head rises out of the engine-room hatch, winks solemnly at me, remarks to the skipper, 'Show him a thing or twa,' and pops in again.

The eastern sea-rim burns red to the flush of dawn; a wine-red carpet spreads quickly over the heaving leagues, and our wake flashes prismatic gems from myriad facet-points of fire.

The dawn wind, rich with the perfume of all

The mornings, strokes our faces and ruffles velvet tresses in our hair. The sun leaps the horizon, and it is blue day—sea and sky of softest indigo.

Beyond the bluff of Cape Brett, breaking the skyline, hangs Piercy Island, a black jumble of jagged rocks afloat in the blue depths. The channel between is narrow and deep, and through it a fair percentage of the south-going whales pass on their way. This is the scene of operation. Strong wire-rope nets meshed to seven feet, hung on wire cables supported by huge floats and drogues, close the water-run with an impenetrable barrier of steel mesh.

The principle of the nets is not to stop, but to hamper the quarry that it falls an easier prey to the hunters. No mortal fastening yet devised could withstand the hundred-ton momentum of a charging whale, backed by its mountain of thew and muscle.

Three separate nets are used, and so arranged across the channel that, on 'striking,' a whale may 'race' seaward or 'sound,' carrying the net with 'her,' without fear of disturbing the remaining two. Each net has a depth of two hundred feet or so, with a surface stretch of a hundred feet.

Launch and boats take their station behind the nets at a hundred yards distance. The skipper points up-channel to something that looks foam-fringed in the morning sun. Little jets of spray spout and flash about it.

What is it? A half-tide rock awash in the surf? A great kauri log adrift from some shipman's raft? But no; the thing moves. It drifts lazily from side to side, and draws nearer. Now it goes under in a swirl of white, and reappears a minute later.

A whale! surging leisurely on its way to the sea, dorsal fin and twenty feet of gray-black back showing above water.

The skipper points again, this time to what looks like a mass of broken shell and shreds of fishy substance, mixed with tangled sea-grass, and comes floating up through the clear water.

'Barnacles,' he says, 'scraped off on the bottom-rocks. That's what brings 'em close ashore,' he goes on. 'Up in them tropic seas barnacles fixes on to the whales thick as hairs on a pig, an' they makes in here to scratch 'em again the rocks on the sea-floor.'

To the landsman a veritable fairy-tale, but—there is the whale, and there the broken barnacles.

III.

Suddenly a wild whirlpool, away by the floating net-floats. A section of the float-line wrenches together, and surges bodily toward us. The placid waters around seethe, foaming, and our little launch dances like a cork in a mill-race.

A huge head, a monstrous body, webbed about with clinging gossamer of wire-rope, rise

fifty feet in air. A moment the mighty bulk rears on its tail, curves like a bow, and, with a noise of thunder, goes under for the 'sound.'

Away race the boats, each crew eager to be first 'fast' to the 'fish,' which must come up soon to breathe. We in the launch follow at half-speed, and come up as the monster reappears—a wallowing, snorting mass, whirling tail-flukes and lashing twenty-foot side-fins beating abroad a smoke of foam and spray.

The net holds good. The whale's desperate struggles serve only to entangle it the more hopelessly. A white puff of smoke from either boat-bow, two flat reports, and the harpoon-irons are 'home.' A spasm, a shiver through the sea, and the huge bulk is away for the 'race.' The harpoon-lines smoke round the loggerheads, and the dancing boats go swirling in the wake of the flying 'fish.' But the race is not long. The hamper of tangled wire-mesh, 'bunched' net-floats, and drag of towing boats soon bring it up 'all-standing,' and the boats haul in on their lines.

Now the battle begins in dead earnest. The whale heaves huge sides half-out of water. Mad with terror it strains, plunging to break the unknown clinging horror that grips it. The boats draw in warily on either side. Deadly eight-foot lances strike deep for the heart, behind the pectoral fins.

A seething wallow, whirl of pink-eyed foam, a shuddering sound, half-sigh, half-groan, and a huge gray-black mass that writhes and tosses! Mighty fins, curved scimitars of bone and sinew, hiss through the air, and strike blindly at the attackers.

There is a moment of fear. But the boat-steerers are good men. A sweep of the long steer-oars, and the boats, swung aside, are backed out like lightning, and blows that would have beaten men and boats to a pulp fall harmless.

It is soon over. The lances have bit deep and true. The 'spout,' scarlet from wounded lungs, hisses from wide nostrils that quiver. Feeble slaps of the mighty flukes, huge fins that shiver in air, like the wings of a wounded bird, and, wallowing over on its side, the monster floats lifeless. Holes are cut through the gristle of the underlip, hawsers roved through them, and the dead 'fish,' with boats towing behind, follows at the stern of the launch to the flensing jetty at the station.

IV.

Here the barefooted 'flensers' take charge, and leap down to precarious footing on the floating carcass. Ankle-deep in oil on the broad back, they cut hide and blubber into long strips or 'blankets,' two feet wide, working diagonally around the body. An incision is made in the end of the strip, a chain hooked on, and the winch started, and, as the dead whale revolves in the water alongside, the

'blanket' of blubber peels from it like thread from a cotton-reel. Waste flesh and offal go to the 'digerter,' to emerge as prime fertiliser. The great bony skeleton, broken and ground, reappears later as bone-dust for the farmer.

No particle of the mighty bulk is wasted. A meat cannery is attached to the station, and here the choicer parts of the whale-flesh are canned for export to the South Sea Islands, where the natives buy it eagerly in preference to land-fed beef. And the trade is growing.

All the world knows the whale is a true mammal, warm-blooded and red-fleshed. But what the world does not know is, that certain portions of the meat of it are not to be distinguished from the prime cuts of the best land beef ever fed. Whalers, the world over, have long regarded it as a choice delicacy.

He was an artist, that chef at Wangamumu. He stayed us with dishes of whale-flesh to delight the heart of the most exigent of epicures; dishes to win tears of gratitude from aldermanic souls. But of that more anon.

'Humpbacks' and 'sulphur-bottoms,' with an occasional 'sperm' or two, form the bulk of the 'catch' at Wangamumu. Though carrying none of the valuable 'bone' (whalebone) that makes the 'right' whale so much sought after, they furnish a thick coat of blubber, and, under the no-waste system, are made to yield a very good profit. The average 'take' of oil, on trying-out, is from sixty to a hundred barrels. Now and again an eighty-foot 'sperm' will find its way to the nets, but the usual 'run' of whales caught may be anything from forty to sixty feet in length.

Often than not, when attacked, the efforts of a whale are confined to attempts at escape. It sometimes happens, however, that the angered monsters will charge the boats 'open-mouthed.' This is especially so in the case of 'sperms,' when only the trained skill of the boat-steerers can avert disaster. An eighty-foot 'sperm,' fighting-mad, fifteen-foot jaws agape, as he 'rushes' the boats, is a fearsome opponent, likely to try the mettle of the hardiest crew.

V.

More things go to the make-up of an American beef-can than the world wots of. So far Wangamumu stands alone as the one place where the canning of whale-beef is conducted openly and above-board. He would be a bold man, however, to forecast the future, and who shall say how short the time ere it is made possible and usual to greet the morn with a tin of potted whale as an indispensable of the world's breakfast-table? I talked it over with the whale-master. He saw no difficulties ahead, and waxed enthusiastic.

'Let the rich men do it,' he said, in a burst of vicarious philanthropy. 'Let them do it, and give it to the poor, and,' ruminatively,

'there's a deal of picking on an eighty-foot whale!'

The idea is colossal. Think of it, ye millionaires and good philanthropists! London's jaded palates tickled with a dish of potted 'whale's-tongue'; Paris happy with 'flake-cutlets'; the starving millions full-fed and strong on a diet of whale-beef, succulent and nutritious!

Though off the beaten track, Wangamumu is well worth a visit. It is unique. In no other place in the world are whales captured by means of nets. Let me say, at once, that the whalers are hospitality personified; that here one may study, at first-hand, the whole duty of the modern whaler; may watch leviathan poke his nose into a net and emerge, a few hours later, canned and labelled for the table, or neatly bagged as manure for the farmer.

Rugged rock faces; sloping cliffs, ablaze with flowering trees, that drop steeply to the water's edge; golden beaches that sing through tropic nights to soft drumming of a droning surf, appeal to the nature-lover. Above all the breeze, ozone-laden from thousand leagues of ocean. What an air that sea-wind brings, genial, full-bodied, generous, a strong wine of Cos that compels to laughter, that sets the blood a-tingle in the veins!

Four bells in the first dog-watch (6 P.M.), and the labours of the day are over. Whalemen, crews, and flensers step ashore for rest and dinner.

I dine with the whale-masters and officers. Every one comes to the feast with an appetite like unto Milo's. And what a meal it is: fricandeau de baleine; whale's-tongue, à la maître d'hôtel; petites côtelettes de whale-fluke! Never sat Lucullus at feast of stranger meats, or more delicious.

As we empty our glasses in a good-night toast, there flashes to mind a capricious picture of a former famous banquet, where

The fish was two delicate slices, crimped,
Of the whale that swallowed Jonah.

The fantastic lines sing themselves in my brain like a literary nightmare. They refuse to be exorcised. At last sleep comes with a sigh for poor Elia. He never dined at Wangamumu! What a poem he would have made of it had he been with us!

CHILL WINDS.

WHEN the winds from Grampian blow
Then I turn the other way,
Fearful of the thoughts that flow,
Fearful of the things they say.

O that I were deaf to hear
Whistling winds that chill me through,
And that I were blind when near
Places where I trod with you.

Chambers's Journal

SEVENTH SERIES

CLIMBING A PEAK IN DARIEN.

By STEPHEN GRAHAM.

PART I.

I.

COLUMBUS sought first a new way to India and glory for Spain, and then his followers sought gold and gems. Spain made a rapid transit in Time. For, as a young man has visions and the mature seek fame, so the old and disillusioned turn cynically to gold as the only substance which in the end will not disappoint its possessor.

Spain became old suddenly. Was it rapacity bred decay, or decay rapacity? Even the Indians, who admired all else, laughed at the Spanish lust for gold.

It was given to 'the most faithful son of the Church' to discover America; given to the conqueror of the Moors to despoil it. In a time of growing heresy, word-of-mouth heresy, mathematical heresy, Spain in action wrought out one of the greatest of heresies, proving by discovery the existence of a new world.

Yet Spain reposed spiritually on a mediæval faith, and the spirit of Protestantism rising at that time was the negation of that faith, saying 'No' to the sword of the Lord and the triumph of the Saints. And Spain could not partake of the new, for she had not that Teutonic self-questioning about conscience that stirred the North. Scandals did not scandalise Spain. And the pother about indulgences was merely disloyalty to God's vicegerent. Spain had no quest after truth. It was enough to apprehend the beautiful and the true. For the rest, she had the blind faith of the Church. Hence the ferocity of the Inquisition; hence, at a later time, the rise of the Jesuits, ready to give their undivided wills to St Peter in charge for God.

New history mocked the old when Spain began to prove the world was round, and that the little old sheep-fold and pasture and Mediterranean lake made only a particle of God's creation, and that the first fifteen centuries of the Christian era had been blind to half the world.

Mankind was groping through the mediæval forms toward a life more unconfined. On the one hand was the anchorite in his cell in the wall of the Church; on the other, Columbus sailing to the West. The navigator seemed a

daring free-thinker to his sailors, an impious man who ought to be restrained. Nevertheless, in a spirit of profound religiosity Columbus and his crew found first land and named it San Salvador, the Holy Saviour.

Devout wonder, devouring curiosity, fantastic credulity, lust for treasure, quickly followed one another in the Spanish mind. The vision ruled in the heart of Columbus, glory rose in the eyes of the monarch behind him, cupidity itched the fingers of the multitude. But the world wondered; the old world paused whilst a new idea entered it and a new seed of life was sown.

Four voyages in sailing-ships, tempestuous, troublesome, anxious, with ever more credulous and violent crews—but Columbus clung to the last to the hope of a new way East. How mysterious, how haunting and pathetic, and yet visionary, the fumbling and nosing of Columbus's vessels along the coasts of Panamá and Darien in that last voyage of his, sensing a place where a passage must be made! It is like the trouble of Nature before sunrise, a thought before dawn.

II.

San Salvador is a long strip of low-lying shore, a platform above the sea, and at night a lighthouse beaming over the dark ocean. It is a shore and it is a light. That is what it was then, 'the other side,' and the light of salvation.

The story of the first islands, those bits of Paradise vouchsafed to lost mariners, is pitiful and tragical; the story of the mainland, the Spanish Main, is violent and sinful. Adam voluntarily banished himself from Eden a second time. With the banners of the Church and the spirit of Cain the discoverers set foot in the New World.

'In the Name of God, let us remain here,' cried the tempest-tossed Diego de Nicuesa, in 1507, when he found the quiet water of Nombre de Dios Bay. 'In the Name of God! In the Name of God! *Nombre de Dios! Nombre de Dios!*' cried his followers. And there they made a colony which endured, and in time made the first base for the Treasure Fleet. Balboa discovered the Pacific in 1513. In 1519, on the

shore of the other ocean, the city of Panamá was founded. In 1520 Magellan rounded Cape Horn. In 1521 he reached the Philippines, where he was killed in battle. But the survivors of his ships sailed on and reached, with no small astonishment, the Cape of Good Hope, and then made Europe, thus circumnavigating the world. Magellan called his ocean the Pacific. In 1521 Cortes got to the Pacific, crossing Mexico to Tehuantepec. In 1524 Pizarro set sail from Panamá City to the conquest of Peru.

Then commenced the building of the Royal Road, *Camino Real*, through the jungle of Darien, for the safe transit of the treasure-caravans, and Spaniards enslaved Indians, and made them hew a way with knives and carry the blocks of stone, cobbling it a yard wide all the way from Nombre de Dios to Panamá itself.

Pearls and gold came from the South Seas, gold and silver ornaments, gems of all kinds, and then gold and silver in massive bars. The pack-trains, led by the muleteers and guarded by men in armour, toiled through the dank hot jungle. There was built at Nombre de Dios a great stone treasure-house, where the spoils were heaped up or stacked to wait the coming of the galleons. The Plate Fleet, bearing to Spain its precious cargoes, became the astonishment of the ocean, firing the thoughts of pirates and adventure-seekers, and not least, England's Elizabethan sailors. The Plate Fleet was harried; Nombre de Dios was attacked; Nombre de Dios was burned. Nombre de Dios became known as 'the Spaniards' Grave.'

III.

I sailed there in a little boat with a wizened old man, who was owner and skipper and cook and sailor all in one. And, as we rode over the curling waves, his talk was all of gold. There were a score of tatters in the only pair of trousers he had in the world. I advanced him ten dollars to buy provisions and oil for his little cooker. He wore a twenty-year old straw hat; he collected newspapers, which he seemed to regard as precious in themselves. But he said, 'My God'—he was very profane—'when I get some one to put capital into my mines I shall be king.' A cross between a German and a Panamanian negro, he was at once credulous and calculating. I could not convince him that I was not seeking gold, or oil, or at least manganese. The German in him made up his mind about me. I was made to correspond to the description of my type in a Leipsig encyclopædia. The negro in him was fantastically imaginative regarding the treasures of the Spanish Main. He had sailed for forty years, seeking gold, seeking treasure. Far from its being a pestilential coast, Darien was Paradise. It was a health-resort; there were no mosquitoes.

'This land is Aden,' he kept saying, filling me with mirth, for he meant Eden all the time.

We passed, or were passed by, many schooners manned by Jamaicans, proudly and superfluously flying British flags; and by San Blas Indians in dug-out canoes surmounted by the most rudimentary sails. We came alongside and looked on the mean cargoes of coconuts and bananas, and on the Mongolian features of the untamable Indians. The same Indians, whom the Spaniards treated so ill, have long since recaptured their country, and have established a feud with white man and black man. Nearly all Darien to-day is called 'The Forbidden Country,' and no one who is not an Indian dare remain there after nightfall. But the Indians come down to the shore, or even set off in canoes, to trade fruit and monkeys and parrots for—one thing mostly—powder. The Spanish priests tried to teach them to pray to God. But the other Spaniards brought a more convincing gospel of powder. My skipper evinced great contempt for them, however. 'They'll never be no use till put underground,' he averred. 'All this'—he pointed to the entangled jungle of the shore—'is white man's country. Only white men can do any good here.'

We called at tropical islands, all gnarled rocks and upstarting palms, places for pirates, places for loot. We called at inhabited islands, trading islands with great general stores. On these were white men making a fortune by intercepting the schooners and bartering fruit for canned goods, tools, guns, cartridges. But the wild shore of the mainland held the eyes.

Green hands of the jungle reached out from the tangles, as if all the trees and shrubs were also savages locked in some orgy in which the young and slender were being suffocated or trodden under foot. Hands of despair were stretched outward to the sea. But when we came into Nombre de Dios Bay the barbarity of the vegetable kingdom seemed to have receded as age and depravity step back for innocence. The gentlest of waves rippled forward on a fine half-round of sand. And there might well have been many children playing on that long curve of shell-strewn beach. It was peaceful. It was sun-bathed and blue and gleaming—and it was empty. Even the two schooners and the three dug-out canoes were hidden from view by the breakwater and dam. A huddled village with thatched roofs looked out from under isolated fringing palms—like gray women with shawls about their ears. In the background a ruined church of stone.

Time stood still in the mind whilst I turned back the pages of the chronicles and saw this bay of childhood and romance as the 'Spaniards' Grave.' Here, then, lived Francis Drake in disguise, watching how the Spanish shipped the treasures of Peru on to the Plate Fleet. Nombre de Dios was built in stone then; but you will

search in vain for that stone to-day, unless it is in the structure of the church or in the roadway of the Treasure Trail.

'I have brought you to the mouth of the treasury of the world,' cried Drake when in 1592 he captured Nombre de Dios and led his seventy-three English sailors to the stacks of bars of gold and silver there, so heavy no man could take any of them away.

Even at the moment when El Dorado's gold confronted them the Spaniards rallied, Drake was shot in the thigh, and his companions were driven off, but the English seamen returned several times, and at last destroyed the city so that it never recovered. Drake, after many adventures, returned there to die. He ambushed the treasure-caravans; he way-laid the Plate Fleet. With his little ship *The Golden Hind* he captured the great galleon called *Cacafuego*, he burned Santa Domingo, he fought the Armada, he sailed round the world, he singed the King of Spain's beard. He played at bowls in Devonshire part of the time. But it was Nombre de Dios and the Spanish Main that held him at the last, for in a leaden coffin his body lies there somewhere under the quiet sea.

The people who live in Nombre de Dios now are in themselves the ruins of nations. Chinamen married to Negro women who are themselves partly Spanish, partly Indian; Moslem traders from India living with Jamaican girls who are half English; here lives a Polish-American trader with a mulatto. And the children! They swarm, and are just savages. Even the missionaries avoid them. Even the Catholicism, to which nominally they belong, has no hold. Its church has no roof—and a padre to brave the mosquitoes is not there.

IV.

Neighbour to Nombre de Dios upon the Spanish Main is Puerto Bello, which afterwards became the anchorage of the Treasure Fleet. But Puerto Bello also was destroyed, and also by one of Albion's hateful isle—though he was by no means a true hero of romance—Henry Morgan the pirate. He blew it up; he marched with his crew, cutlass in hand, across the isthmus, and fired Panamá too, or caused the Spaniards in defence to fire it, thus wrecking the fairest city in America of its time, a city of seven thousand cedar-wood houses, two hundred treasure-houses, and three-score churches with golden altars, a city already of thirty thousand souls. That was in 1671. He was rewarded by his king, after he had bought a knighthood, and was made Governor of Jamaica; had, in fact, quite a modern career. They point his grave out to you as you sail along the shore, and every half-savage in Panamá knows more of him than of Drake or Balboa. And at Puerto Bello there has

remained untouched for two centuries the spectacular ruin which he wrought.

The rusty guns lie where they lay 'the morning after,' beside the massive stone fortifications. Spiked, useless, and yet impressive in idleness, it is surprising that they have not been taken away to become ornaments of some new city square, or at least for the value of the metal that is in them.

Puerto Bello has a mixed Negroid population and many bamboo huts. But it has also stone houses. It was once well laid out, and has beautiful little stone bridges and pleasure-seats. The fortified part is extensive, and as one walked the ramparts—the only European, indeed the only person about at all—once more Time, as it were, stopped in the mind, and one realised the night when the pirates came, and, drunk and idle, the Spanish soldiers, and dire the fate they met.

But I left behind me the thought of Morgan at the old portal of the city where, scarcely moulded over, stand the three crosses which mark the place where for nearly two hundred years the treasure-caravans came regularly and made an end of their long, arduous, jungle journey, and the priests gave blessing whilst enslaved Indian coolies toiled and soldiers and sailors swore.

And the old disused cobbled roadway plunges through sedges under the marsh and into the vegetation and darkness which has long since swallowed it up.

From Puerto Bello, Morgan crossed the isthmus; from Nombre de Dios Drake crossed it, and from a 'goodlie and great high tree' looked on the waters of the South Seas for the first time. Where exactly Balboa crossed it no one knows, for no one has come that way again. But it was certainly in what is now called the Forbidden Country, which the Indians have long since recaptured, and now hold by force of arms, to the total exclusion of all who are not Indians.

V.

It was in the Forbidden Country that William Paterson landed in 1698 with twelve hundred men, gentlemen of Scotland, clansmen, old soldiers, traders, and uncovered on Darien's shore the banner of St Andrew blessed at Leith at parting. And they mounted fifty guns and called the fort New St Andrews, and proceeded to organise a trade-road through the jungle, a mere fifty miles to the other side, convinced that thereby the trade of the world would begin to pass through their hands.

The expedition failed disastrously. It seems the Scotsmen were greatly discouraged by King William the Third, who loathed the Scots, and ordered his Governors at Jamaica and elsewhere to refuse them supplies. They were strong enough to keep both Indians and Spanish off,

but they lacked adequate food, and were soon sorely stricken with fever. Their relief ship foundered off Cartagena. Paterson became temporarily deranged. Apathy—or was it despair?—seized the Colonists. Without realising a doyt of their expectations, and reduced to a mere handful, they returned to Scotland. They had been eleven months on the Spanish Main—and some they left behind lay there for ever.

Where many died you will, however, search in vain for Scottish graves. Only the imagination, going back once more, may yield a whisper of the pipes played on that desolate shore.

VI.

They all sought gold; poet-discoverers, conquistadores, heroic sailors, dastardly pirates, Scottish shareholders—El Dorado was their common goal. Even Balboa himself, raising human eyes on the Pacific, was accompanied by those who 'look nowise but downward with a muck-rake in their hands.'

Balboa had settled at Salvatierra in Haiti, and sailed across to Santa Maria de la Antigua on a shore of the Gulf of Darien, and was joined by a group of men whom he captained, making fantastic expeditions into the interior in quest of a massive gold idol—it, The Golden One, El Dorado; and they fought continuously the warlike Indian chiefs and their retainers, generally making the vanquished their allies and seeking out another chief against whom the conquered Indians nursed some grievance.

The Indians wore ornaments of gold, as they still do to-day, but they placed no value on the metal itself until it had been fashioned to some end. But the jewellery, of which the Spaniards ravaged the tribes, led them to believe in some great source. Comagre gave Balboa four thousand ounces, and told him that on the other side of the mountains was a great sea and cities and ships and wealth inexhaustible. And the explorer pondered the matter in his heart, and he said, 'God has revealed the secrets of this land to me only, and for this I shall never cease to thank Him.' An astonishing idea, that God, the spiritual genius behind

all creation, should be taking thought to reveal gold to thieves—and yet it was sincerely held.

It was not exactly humour that the Spaniards lacked. When the first jackass made his first hee-haw on American soil, appalling the Indians, who appealed to know what this strange animal was wanting, a Spaniard replied, 'He is saying that we need more gold, still more gold; do you understand?'

Material desire and the fever of exploration drove Balboa on, and with a hundred and ninety followers in chain-mail he sailed from Antigua to the lands of the subject-chief Careta, whose daughter he espoused. This was at the beginning of September 1513. He travelled two days along the shore to the domains of Ponca, and then, after a fortnight, they started inward to the heart of the jungle, cutting their way with their swords, sweating under their armour, and in four days of unbelievable difficulties they came to the foot of high tree-clad slopes. There they encountered Porque and the Indians of Quarequa. Porque they slew; the Indians they dispersed; the gold they took. That was on 24th September, and on the next morning, early, Balboa set off to climb the mountain of the world, with his Spaniards behind him and Indian guides ahead. There were with him also a priest and a lawyer and a dog. The priest was for God, the lawyer for the King of Spain, and the dog for himself. Little Lion, the bloodhound, held military rank and drew rations, it is said. He was alleged to be worth any three men.

Where is Quarequa? No one knows. Perhaps it is even an invented name, and the fight put in by the narrators to give feature to the story. How many hours Balboa's party struggled from the Indian village to the top of the sierra has not been calculated. Did Balboa look upon the Pacific at noon—or was it in the glamour of a later light? Possibly, with his Indians to lead him, it was still morning. And it was still morning in the soul—the morning of new life and light, the morning of discovery.

Balboa halted his party, and then advanced alone and saw the sea.

(Continued on page 121.)

A GIPSY OF THE NORTH.

CHAPTER VI.—continued.

TOGETHER they turned and went back to the camp, outwardly in precisely the same relation as they had been when they left it. But Carwyke knew that really there had been a profound change in their position to each other. By some feminine intuition the girl had divined what was in his mind; and, fearful lest he should in any way disturb her reliance upon

him, he determined that for the future no sign of his real feeling towards her should escape him, until at least the girl was in a position to act for herself and to order her goings. Till the end of this wilderness journey, their relationship must be one of friendship only.

But whilst it was comparatively easy to make the resolution, it was, he found, difficult to

adhere to it. Once or twice in the course of the meal he found the girl's blue eyes meeting his own with a shy, wondering look in them, and knew that if he spoke what was in his heart his desire would find a response in her. Young though she was, living among the Eskimo all her days, Norma could not be ignorant of the facts of life or of the deeper relations between men and women. Standifer had already spoken to her of marriage; and whatever her father's teaching might have been, and in spite of her remoteness from women of her own race, it was clear that she knew what that relationship involved. It would be easy to win her now. He had but to speak to obtain her heart's response; of that those shy looks of half-understanding assured him. And when they reached civilisation things might be different. Some one might show up to claim her and carry her completely out of the world in which he moved; or some other man might move her more deeply than himself, in which case—

His thought broke off there. Quite suddenly he saw himself as he must appear in her eyes—a man who had risked, and was risking, his life for her. That was, he knew, an enormous asset in his favour. But again repressing his surging desire to make her his own, he resolved that he would not use that advantage. He would serve her and await the issue, letting his services speak for him, without urging them upon her when the moment for speech came.

In the few days of their companionship quite naturally they had turned to each other, for Billy with all his virtues was of a different order and of commoner mould. Each day they had walked off together after supper, leaving the squaw-man complacently smoking by the fire. But to-night, when at the conclusion of the meal Norma rose and moved across the tundra, Carwyke deliberately remained in his seat by the fire. Billy waited a minute, then shot him a glance of inquiry. Carwyke kept an impassive face. At last the ex-whaler spoke.

'A tiff?'

'No?' answered Carwyke, with a little vexed laugh at the thought that the other should so easily have discerned the situation.

'Then why don't you go? Legs stiff or what? There's Missy lookin' back for yo.'

Deliberately Roy Carwyke kept his eyes from turning in the direction of that lissom figure moving across the sodden moss, knowing that if he saw the girl looking back he would not be able to resist the implied invitation. 'I'm tired,' he said evasively.

Eskimo Billy spat in the glowing moss of the fire. 'When I was young,' he said, 'I wasn't never too doggoned tired to walk with a nice girl.'

'No!' answered Carwyke, with a laugh. 'And perhaps I'm not quite so tired as I'm

making out. But there's decency in things, you know.'

'Mebbe!' answered the other, with a flash of understanding in his eyes. 'I wasn't reared thet way. I've a-took what's come as it come to me; an' thet's what I should do now, if I was yo', Mista Carwyke. Missy's yo'rs for ther askin', as any one can see with half an eye—an' I don't know thet I'd wish her any other man.'

'But I sha'n't ask, Billy—yet.'

'Um! I got yo'—mebbe yo'r right. Thet's ther gentlefolk's way, I guess; but 'tain't mine, though to be sure I had what Mista Mannering would have called scruples about Teriksin, an' mayhap they was akin to what yo're feelin', Mista Carwyke.'

Carwyke looked at the man wonderingly. 'I remember,' he said quietly. 'You married her.'

'Yep! An' for her I'd have lived and died in this gol-darned wilderness. Thet's how I felt, Mista Carwyke, an' I guess thet's how yo're feeling about Missy there; an' straight, as from man to man, yo're a fool if yo' don't up an' tell her so this very minute. I reckon I'd be only too pleased to know thet she was in yo'r hands for good—and remember, for three years I've been sorta father an' mother to ther kid.'

'I'm sure you wish her well, Billy, but I must follow my own judgment,' answered the other, and then deliberately changed the subject. 'Tell me about Teriksin.'

'What's there to tell?' answered the ex-whaler hoarsely. 'I married her fair and square, an' then one day comes along thet Russian, an' my igloo was left to me desolate.'

'Did she go of herself?'

'I do' know!' said Billy. 'Thet's ther 'ell of it, Mista Carwyke. Ther women at ther camp could tell me nothin'.'

'The Russian? You knew him?'

'I'd seen him twice. He called himself a priest—an' mebbe he was one, but he was a priest of 'ell! He drifted in one day to see Mista Mannering, an' again six months later, an' I reckon must have seen Teriksin then, for it was ther very next winter thet he came an' spirited her away. But I'll get him yet! When Missy's clear of this I'll come back, an' if I've to tramp Alaska through I'll find him. Priests ain't thet common up here thet I won't hear of him one o' these days, and when I do—' He broke off and laughed fiercely. 'Mista Mannering used to tell me that ther good book said, "Vengeance is mine; I will repay, saith ther Lord;" but it's mine too, an' mine first, an' I reckon I'll do my own repaying with a rifle-bullet or six inches o' steel!' Again he laughed savagely, and added, 'There is a cold fact thet can't be mistook.'

He ceased to speak, and, his pipe out, sat staring sombrelly into the fire. Carwyke, not

knowing what to say, also remained silent, and a moment later, lifting his eyes, saw that Norma was returning. When she reached the camp he thought he saw a shadow of disappointment in her candid eyes, and, after all his resolutions, reproached himself for having remained in camp instead of availing himself of the pleasure of her company. And until they turned in for the night it was a silent trio that sat in the lee of the smoky fire.

Three days later, the river proving impassable, they left it, and made a long portage to the Height of Land, spending three days in the operation; and on the evening of the third day looked down on a small lake, and beyond it a river which led to the first outposts of the great woods. On the long slope to the lake the willow bushes were taller, the dwarf pines of much sturdier growth, and instead of the all-pervading moss, clumps of nigger-heads lifted themselves in view. As he stood looking across the wilderness, far away to the right, Carwyke saw something which made him stare intently. It was a thin veil, that might be fog or smoke, which as he watched seemed to hang about a small stream running in the direction of the lake. He called Billy, and pointed out the place. 'What is it?' he asked. 'Mist or smoke?'

The ex-whaler stared steadily for a moment, then gave his opinion. 'Smoke, Mista Carwyke.'

'And smoke means a fire—and probably a camp.'

'Yep!' answered Billy.

'You don't think it is Standifer?' asked Norma, who had drawn near.

Carwyke shook his head. 'I don't see how it can be. We had the start, and we have wasted no time.'

The ex-whaler gave a sharp exclamation. 'Ugh!'

'What is it?' asked Carwyke quickly.

'I wouldn't be so sure about it,' answered Billy quickly. 'Thet Standifer's no fool. S'pose he knew that the river we came along would bring us south. S'pose he guessed thet naturally we'd make for ther Height, an' thet instead of following us he made a cut-off and took ther risk of getting on ther lower side first.'

'But how could he do it? Remember we've pressed the pace, Billy.'

'Yep! An' ther river wriggled about some, an' we've lost a goodish bit of time following its windings. Standifer had a boat. S'pose he drove down ther coast, and took one of them rivers farther south. There's lots of li'l creeks thet nobody except a gold-seeker or two or ther Eskimo ever bothers about, an' if he hit one thet was on ther right side of ther Height—why, there yo' are!'

Roy Carwyke whistled softly to himself. He could not deny the possibility of which the ex-whaler spoke. Then he gave a harsh laugh.

'Well, if you're right, Billy, we'll have to make a fight for it. Standifer shall not have Miss Norma whilst I live. But before fighting we'll run. If we can make that lake without being observed, we shall be all right. . . . After all, we may be worrying ourselves needlessly.'

'I ain't prepared to take no chances with Standifer!' answered Billy.

'Nor I! We'll work down towards the river. There's a gully away to the left there that will hide us, and once we get to navigable water again we shall be all right. Of course, we may have no trouble at all.'

They crept to the watercourse which Carwyke had indicated, and began the long and slow descent to the lake. Presently they reached a place where willows scattered on the edge of the gully offered better concealment, and made a quicker pace. The gully deepened as they descended; and knowing that they were now out of sight of any one not posted on the crest of the slope, they pushed on desperately. An hour passed, two hours, and they still followed the watercourse, carrying the light kayaks on their backs, stumbling among the stones, slipping on moss-grown rocks, and splashing through pools of water.

At the end of that time sheer weariness compelled a halt, and, creeping to the top of the bank, Carwyke looked over. The smoke was now plainly visible, drifting in a long cloud in the light wind, and as he watched, he had even a fancy that he could catch the pungent odour of the burning moss. As near as he could judge, the fire was about a mile away; and whilst they rested he watched it carefully, keeping his head low, for he remembered that Standifer had glasses. He saw nothing of the camp or the campers, and, though he searched the landscape narrowly, he caught sight of no human presence.

At the end of two hours they resumed their journey towards the lake. The mosquitoes, which had been bad at the beginning of the descent, were now less troublesome; there was a great stillness over the land, broken occasionally by the weird cry of a loon; and the glow in the sky above the crest of the slope behind them proclaimed the rosy midnight of the north. Well-nigh dropping with fatigue, they pressed on, and were almost within reach of the lake, with the camp on the slope a mile behind them, when an untoward thing happened. In the gully Billy, who was leading, startled a caribou, which was drinking at one of the pools. It sprang up the bank, and in its turn startled to flight a pair lying in the open; and scarcely had that happened when, from somewhere up the slope, far away, but distinctly audible, there sounded the cry of a human voice, which was answered by another.

'Quick, Billy; there's no time to be lost. Those beasts have drawn attention this way!'

They plunged on recklessly, trusting now to the concealment of the willows. Once or twice they heard shouting, but did not stop to reconnoitre. It might or might not be Standifer and his men, but they could not afford to take risks. Just as the gully broadened to a marsh at one end of the lake, where they were forced to step into the open, the shouting was renewed. And as they reached the water, and, breathless and panting with their exertions, arranged the stores in the kayaks ready for launching, there came unmistakable evidence

that they had been observed, for above their heads there sounded the sudden drone of a bullet, followed by the faint, far-away crang-g of a rifle.

'Standifer! Ther black dog!' yelled Billy, beginning to unsling his rifle. 'Push on. I'll keep ther divils back.'

And as Norma and Carwyke took the water, they heard his rifle crack behind them, and at the same moment a hostile bullet ricocheted on the lake in front of them.

(Continued on page 116.)

HALF-TRUTH.

By A. W. THOMSON.

IF we are to tread the path of life with graciousness, and, in the jostling of self-help and mutual help, crowd our way in decency from birth to death, the matter of truthful relationships becomes a study of exceptional complexity. Though deep enough in all conscience, the subject is perhaps not so puzzling in the narrower individual life of the constant personal touch. But when you apply it to the larger ties with which you are bound to the common humanity you do not know, but with whom the exigencies of your own life, as a unit, are inextricably bound up, the affair assumes an appallingly difficult aspect; so appalling, indeed, that in fits of greater callousness you insensibly knock about the truths that cement the lives of people in as careless fashion as you knock about billiard balls.

You are not wholly to blame; for it is often nearly as difficult to define the truthful interacting and engaging in ordinary affairs and issues as it is to come by the essential facts in a complicated court of law case. The business of living is mainly an immense 'combine' of cases, longer or lesser problems, as puzzling as law cases. And workaday is, after all, but a jog-trot of moves and counter-moves through the interminable series. We each set out to attain our little ends, to win our petty cases, and, by hook or crook, establish right to existence. You have a case of sorts, if it is but to face your digestion to a special dinner, or to prepare your income-tax paper, or to treat with your table-maid who has given notice to leave, almost every minute of your waking day, let alone your working day. And all you can say or do is dictated by your requirements and aims of the moment. So your cases all come under the same general head—self *v.* society—the eternal battle of the ego to keep toeing the line with its fellows, and get forward in command if it can.

The most deplorable feature about those little cases that compose existence is that they convince you that the apparent facts of common

life are but a bundle of parables, all neatly tied up in red tape awaiting your attention. They have a distressing faculty of working outwards like a prodigious geometrical progression. No sooner have you disposed of one than its demise automatically hatches out a couple of others. And it is an even chance against your striking the most truthful solution. The task of knowing your job of living becomes, under such unfortunate conditions, quite problematical. In fact, the only thing you can do, not to break the back of your conscience, or kill a practical spirit with theoretical speculation, is to mix that conscience with all the purpose and work you can find. But your conscience, though the best thing about you, is not necessarily a book of learning. And so by this prescription you may get your leavening to work out as truth suited more or less to circumstances. You set to work on half-truth, or truth diluted, like modern liqueurs and other things.

The faculty of making up a mixture suitable for the practical conduct of daily life bearing a truthful attitude to yourself and others is clearly an art. To bring it to perfection is as difficult as the art of blending teas or whiskies, both of which are highly-paid professions. Conscience is but the foundation, for you need a lot of other ingredients, such as tact, diplomacy, policy, fashion, public opinion, and other seasonings, to make the dish palatable to a consensus of tastes. The job is like building a house. If your foundation is only good enough, you can build on it to please your fancy or to suit a particular utility. If the house does come down, the foundation always remains intact. So much for a good conscience.

Of these ingredients you use a good deal of fashion. For instance, you may not smoke a clay pipe though you know it is healthier than a briar, since, when it becomes coloured in a few weeks with narcotic juice, you are rich enough to throw it away and start a new one.

This is not putting smoking in a very truthful relation to yourself. Nor may you buy the wife of your bosom a beautiful hat that is slightly out of date. You must get what may be atrociously unsuited to her, but has the grace of fashion. And that is but half-truth in the relation of dress to your wife. Again, whether or not you can conscientiously afford it, whether you have a fancy for the pastime or prefer to stick to gardening or the collecting of antique furniture, you must get a motor-car if you are to retain much esteem and many friendships. Now, while a car is pleasure-giving and a convenient accessory of life, it has no business to come as a wedge into the love between you and your friends. So even your car is a thing of imperfect relationship towards you, and but half-truthful in the qualities of its advantages. The fashion of things must touch us, for we are human and demonstrative by nature, though the staidest and most perspicacious will shed a vulgar touch (if a fashion dare be vulgar) without leaving a stain.

As for tact, from the moment you clamber out of bed of a morning until you creep back to it at night, you are confronted with the fact that we are all so dizzily self-respecting on our own flimsy pedestals that a single cross word may upset the conduct of the day. To preserve the proprieties and the intactness of your general position in this respect is a very fine art indeed. In fact, continually to strengthen that position is a finer art than sculpture, or painting, or architecture, or even futurist drawing. We ought to be straight enough in the back and stiff enough in the upper lip to face all the winds that come from anything abutting on the logic of practical common-sense. Yet we are full of a quaint conceit in thinking we perceive the core of things for ourselves. And we are amusingly forgetful that the world is still in the creeping stage, and that to be old before we are young results in physical inertness and mental indigestion. Besides, excessive tact tends to propagate human ignorance, not to speak of its kicking true pride into an insensibility, where pride has no business to be. This, whether you go to the one extreme of covering up by voluble talk, or to the other of complete silence. Curiously enough, in the end, you may find yourself drifting into some body with a catholic appetite for 'isms' when you fling your tact to the four winds, and hurtle your doubtful truths from the house-tops. Mortality, like hardy annuals, would, to use a homely Scottish phrase, often 'hang better as it grows.'

Public opinion is something like haggis or apothecaries' condiments, inasmuch as no one ever quite knows what it is composed of. A pleasant dish it usually is, otherwise it would not be popular or public opinion. But that does not mean it is always the best one for us,

any more than medicine with a good taste is better for us than Dr Gregory's abominable but estimable mixture. Still, public opinion is usually a sound sort of thing in its way. The trouble is that its bad points, such as these are, become insidiously woven into the affairs and conduct of the business of living, since the bare fact of its picturing the trend of the times invests it with what looks like a cloak of sincerity. It is an ill wind that blows along a belief that *vox populi* is necessarily *vox Dei*. But a lot of folk are so set on themselves as to believe so. And we are all inclined to accept the comforting doctrine that what is, with due reservations, must be best. When folk are working in gangs or bodies they are prone to turn a deaf ear occasionally to tentative whispers of conscience and justice. Each can lay the blame to the others, and use them as a pretext. It is a question of courage, and a regiment has more than the individual unit. So circumstantial interests become our accepted morality by public opinion. At the best of it public opinion is but a hotch-potch made up into a nice dish, just like haggis in fact, only sometimes not nearly so wholesome. And you see we thus put a premium on a blend of good and bad, sound and doubtful, on half-truth.

Take any topic at all, and half the people you meet don't know what to make of it. The other half are divided in conclusions, which proves that both cannot be wholly right, and therefore both must be partly wrong. And, since we are all so touchily agreed to differ, you find yourself in your dealings with your lawyer, doctor, banker, wife, tradesmen, work-people, chauffeur, gardener, cook, and maids, for ever squandering time in shaping and reshaping common-sense and kindly directness to a form you judge suitable to carry with you to meet prevailing affairs. The universe is as though peopled with living and animated half-drawn windows. And if you were to pull up the blinds each would mistake the other even in the closest relationships, while in the larger issues the whole world would be at a topsyturvy count of sixes and sevens, with the charlatan's cry ringing despairingly in our ears. The picture is ugly enough from beginning to end, and, in due accordance with the text of this paper, is probably but half-truthful, thus confounding the writer in his own toils. But you must not believe with the cynic (as some will name the present writer) that there is no such thing as truth, and that it therefore can have no uses to study. For, by the grace of God, there is a jolly lot about, and we are indeed all full of it. Only we have an exaggerated habit of smothering it when quite unnecessary in our hearts' embrace. Even then you must brightly remember that nothing altogether dies, even if smothered, but everything is resurrected for future utility.

'ASMAN BOLTA HAL'

A TALE OF THE EAST.

By CHARLES NIBBS, Author of *Some Hindu Servants, &c.*

I.

IN the old days at Cambridge we often played chess together, and although I am a fairly decent player, he usually beat me. In this way we had gradually become friendly, but my limited Western conception made me conscious of a point in his mentality beyond which it seemed impossible to pass. The Oriental imperturbability of Manogi Nath Banerji presented a veil through which I could but dimly pierce, and the psychology of the man was such that in my blunt English fashion I could only sum him up as being a 'queer sort of chap,' and so was content to leave it.

I learned from him that it would be a difficult matter to regain his 'caste' on returning to India, as crossing the 'black water' was an almost unpardonable sin for a Brahman, and that it could only be done by his passing through a ghastly and horrible series of ceremonial cleansings, in which money would avail but little. Next his body he always wore the 'sacred thread'—to me it was only a piece of knotted string—and when he became expansive, which was not often, he would tell me many curious and interesting facts of Brahmanic rites and ancient Hindu mythology.

On leaving Cambridge our ways parted. He entered one of the Inns of Court, and after being called to the Bar, left at once for the East in order to practise at a Provincial High Court. We exchanged a few letters and then the correspondence ceased, for we were both busily immersed in our own affairs. As is so frequently the case, we still reckoned ourselves friends, in spite of distance and lack of communication. 'Varsity friendships, except between the most intimate, are often like this, and are very readily resumed at the point of breakage, even after a long time. There is something in the atmosphere of Cambridge that knits the unspoken bond with almost Masonic strength.

So when I found myself in Calcutta quite recently, it was only natural that my thoughts should turn to Manogi Nath Banerji, and I wondered whether we should have an opportunity of meeting. I knew he was not likely to be a judge, although he was a member of the English Bar, being, as I well remembered, of much too visionary a type for a seat on the Bench. I looked for his name in all the official lists of *vakils* or 'pleaders' attached to the various courts, and made diligent inquiry in all possible directions, but failed to trace his whereabouts, so concluded that, if alive, he had retired from practice.

To escape the intolerable humid heat of Calcutta I had run down to Puri, a small fishing village on the Bay of Bengal, some four hundred miles away, and only about two miles from the famous Hindu temple in the holy city of Jagernaut. At a small hotel, right on the surf-covered beach, a hospitable Scotswoman made me welcome, and I thoroughly enjoyed the early morning swim in the never-ceasing rollers, and the sundry fishing trips in the curiously sewn boats, which the natives handle in a most dexterous way as they toss through the breakers to the calmer waters beyond. In the comparative cool of the late afternoons I wandered through the old Hindu city, untouched as yet by Western civilisation. I was allowed to enter only the first court of the huge temple, as none but orthodox Hindus are permitted farther. Indeed, so far as records go, the few who have proved venturesome enough to successfully pass the many door-keepers and reach the inner shrine of the temple have never been seen to come out. The Government police know this full well, but are powerless to give any help to those who are rash enough to take their lives in their own hands. The religious prejudices and the sanctity of places, whether Hindu or Moslem, are rigorously observed by the Government, which is actuated by a remarkable spirit of tolerance and benevolent neutrality in all questions of this nature.

From the temple to the seashore runs a straight road, about a mile in length, bordered on both sides with peepul-trees and cactus-bushes. It has the poetical name of 'Gate of Heaven Road,' and contains several subsidiary temples devoted to the cult of the different deities favoured by the orthodox. In this road I saw more devotees, fakirs, *yogi*, and holy men than in any other similar place except Benares. Filthy-looking fakirs with long matted hair, covered with vermin, were to be seen on their beds of spikes, with the inevitable 'beggar's bowl' within reach of their eyes. As I had some knowledge of colloquial Hindustani, I tried to get into conversation with some of these men, but neither by word nor by look did any vouchsafe the slightest knowledge of my presence. It was only when I stooped down and ostentatiously put an anna or two in the 'bowl' that I caught the flicker of an eyelid, which told me that the fakir, after all, was quite wide awake to the main chance.

Being, so far as I knew, the only white man in this city of a hundred thousand inhabitants, I was of course followed by the usual crowd of small children and a few of the more inquisitive

adults, who apparently wanted to know what the Belati-sahib would do with the 'devil picture-box.' The click of the camera was the note of satisfaction made by the 'inside devil' when the picture was taken, and the spell which it cast was so manifestly evil that I had a lot of difficulty before I managed to persuade one picturesque-looking individual to pose for me. He probably thought that the few pice I promised him, being a present blessing, would more than compensate him for any possible evil which an angry devil might send, especially as he could safely plead that he was much too insignificant a person for a powerful demon to bother about. No harm immediately ensuing, he now considered himself a man of some importance and quite imbued with Western ideas, which he showed by engaging me in conversation, and as a piece of valuable information told me to go farther down the 'Gate of Heaven,' where, under a large peepul-tree, I could see a very holy man indeed—a *yogi*—who was a Brahman, and a strange Brahman too, for he taught the people.

This was such an unusual thing that I had no hesitation in following his suggestion, and a few minutes afterwards edged my way through a small crowd and saw the holy man. His *dhoti* was spotlessly white, his head shaven, and the 'caste-mark' showed that he had done *pūja* that morning. In the familiar squatting attitude he was quietly talking to the men around. Then I caught his eye, and to my immense surprise recognised Manogi Nath Banerji, graduate of Cambridge and barrister-at-law.

II.

He gave no sign that he had seen me, but went on talking to the people, who listened spellbound as he expounded in simple terms, and with homely illustrations, his scheme of philosophic life, which I soon saw was a curious mixture of the ancient Brahmanic cult and the modern teachings of the Arya Samaj. As these two cults are diametrically opposed in fundamental essentials, the experiment was distinctly bold, and certainly novel.

As soon as he had finished he dismissed his audience with a benevolent gesture, and, turning towards me, gave me a polite 'salaam'; and then in English, but without offering his hand, bade me welcome. 'I have been expecting you, Spencer, and am very glad to see you after so many years.'

'But, my dear fellow, until five minutes ago I had no idea you were here.'

'Nevertheless, I knew you would find me, for so it is written. Please come with me; all I have is yours.'

Rather bewildered by this sudden meeting and his cryptic words, I followed him into a small house of just a couple of rooms, differing but little from the ordinary native huts, except that

it was 'pucca-built.' A tiny veranda in front was just big enough to hold his *charpoy* (string bed); a few grass mats and some brass pots formed his domestic furniture, the only luxury being a dilapidated deck-chair and a small shelf, on which I recognised some old friends—well-thumbed volumes—of our Cambridge days. He offered me the hammock-chair, as being the only suitable accommodation for a European.

Then we talked, and for the best part of an hour we were fully reminiscent of old times, old friends, and the events of the intervening years. I confess that I felt very angry with him for throwing away all his opportunities, as he apparently had, and wanted to know what all this tomfoolery meant; but he waved aside all my objections with the remark that he considered he had a mission to his own folk, and the only way to reach them was by becoming a *sadhu*, *yogi*, or ascetic in his manner of life, and in so doing was absolutely contented and happy, much more so than if he had continued his work in the courts amassing fees for which he had no need. Shelter, clothing, and food were all he desired; and assured of this, in barest simplicity, he would ask for nothing more.

'But enough of me, my life, and my work. I must go my own path, following the Light which has been given to me. It is of you, Spencer, I want to know. Tell me of the trouble overclouding you that has sent you to me?'

I laughed outright. 'There is no trouble, Banerji, and it is purely by chance that I have come across you to-day.'

'It is no chance, Spencer, and I am certain that there is trouble ahead, for so I interpret what is written. What of your sister's son, the little curly-headed boy I remember. Of course, he's a man now—how is he doing?'

'Doing very well, I think. He's in business at home; and, so far as I know, is going ahead all right.'

'You have been his adviser all through, haven't you?'

'Yes, since he lost his father.'

'Well, you must go to him; he needs your restraining influence pretty badly at present.'

'Impossible, my dear chap. I'm not leaving India for a couple of months yet.'

'Go, and go at once. To-morrow will be too late.'

I looked sharply at my friend. Evidently the austerity of his mode of life had affected his brain, and as I fancied I could detect a gleam of insanity in his somewhat dreamy eyes, I was for beating as hasty and dignified a retreat as I could. But his words, 'Go, and go at once,' were burning with an intense insistency into my head, and before I had time to frame a suitable answer to his palpable absurdities, I became conscious of an eerie sensation as I lay in the hammock-chair.

The smoke from the cheroot I was enjoying was curling gracefully upwards, and two or three white rings were forming, and I looked for it to dissolve in the clear atmosphere. Suddenly it seemed to me that I was looking at it from *outside myself*, and with an awful thought flashed through my brain that this was really the insane one, and not Banerji. I was in the little room, yet looking at things from another standpoint, and with quite a detached air. I saw myself comfortably reclining in the chair, with the lighted cheroot between my fingers, and Banerji squatting in front, intently peering into my face. He was still talking in a monotonous tone, and I heard every word quite distinctly, amid an intense silence that seemed to enwrap everything. The humming of the myriads of insects, the gentle soughing of the leaves of the peepul-trees as they rustled in the evening breeze, the distant sound of the tom-toms outside one of the temples, the voice of my friend urging me to see my nephew—all impressed me with a strong sense of a new unlettered personality.

Gradually the character of the place seemed to be changing, the grass matting had become a carpet, a large desk was in the middle of the room, which seemed to have expanded in some extraordinary manner, the little book-shelf had become a big case full of ledgers, and all the paraphernalia of the private room of a business office in London were evident. I even noted that the electric light was burning, although, allowing for the difference of about six hours between Indian and Greenwich time, it should only be about noon in England. Glancing out the window I saw the reason; a heavy thunderstorm was about to break, and all was dark and murky. By degrees the place became familiar. I was in my nephew's office, and there he was sitting at his desk! With an inarticulate cry of delight I advanced to meet him, but I seemed quite oblivious of my presence, and Banerji wondered at his lack of manners. I noted that he looked worried, anxious, and was so deeply absorbed in his work that I thought I should be kinder to wait a bit before drawing his attention. Then he spoke, but I did not catch what he said; indeed, I heard no sound at all, but judged from his lips and his action that he had made up his mind to some course which seemed a bit distasteful, and it suddenly dawned on me that I was there to prevent it. At that moment a brilliant flash of lightning illuminated the room, followed by a deafening crash of thunder. The diversion brought me to my senses, and I cried out, though I was conscious of the terrible effort it cost me, 'Don't do it, Jack!'

Before the reverberating roll of thunder had quite died away, the scene gradually faded into indistinctness and then slowly resolved itself into Banerji's little room again, and I was

quizzically gazing at my own recumbent form in the deck-chair. 'This won't do at all,' I thought; 'I must get into myself again, or perhaps I sha'n't be able to presently.' An intense physical struggle, but without the slightest movement, pervaded my whole body. I couldn't get in. Great beads of perspiration were rolling off me as the only result. Summoning my whole will-power, I concentrated my mind on one tremendous effort, realising that if I didn't get back I was in danger of being looked upon as dead, and, though perfectly conscious, buried alive! It seemed an eternity before I succeeded; then, looking up in a perfectly normal fashion, I saw the last of the smoke rings die away. All had happened in a few seconds of time. Banerji's questioning voice recalled me to the present.

'So you have seen him?' he was saying.

'Yes, I have, but I don't understand—'

'No, and probably you never will. You are too Western in your outlook and environment, but at any rate you will know that I have served you in your need. Go back to your lodging—a storm is brewing—and *Asman bolta hai*' (literally, 'the heavens are speaking,' that is, 'it thunders').

Another peal crashed above as I hastily bade him good-bye, and in a tremor of mixed emotions sought the shelter of my Scottish friend's house.

III.

A few months later I was in London, and after dining at my club with Jack on the evening of my arrival, I was not at all surprised when he began, 'Uncle, I very nearly made a mess of things while you were away, but, thanks to you, I managed to pull up in time.'

I had an idea of what was coming, but purposely said nothing except to invite his confidence; so he went on with his confession.

'Yes, I found myself in a beastly hole, and saw a sudden chance of getting out of it. It looked very simple at first, but it meant going under should I be found out. But on the very morning when I had made up my mind to face the risk and take the consequences, a heavy thunderstorm burst over the city, and in a vivid flash of lightning, which lit up the whole place, I distinctly saw you standing in my office, and heard you cry out as the thunder crashed overhead, 'Jack, don't do it.' It may only have been imagination working on my overwrought nerves, but it was enough, and I'm jolly thankful I listened to the warning, for, after all, I managed to pull through the crisis safely.'

As for my whilom friend, Manogi Nath Banerji, well, as he said, I don't understand, and probably never shall, but I'm none the less deeply indebted to him.

WHILE THE ELEMENTS RESTED.

By T. E. ELWELL.

A DEAD calm in deep water a thousand miles from land will soon be a rare experience. Even in the bygone days of sailing-ships its indefinable charm was felt by few; and but a small percentage of the elect were willing or able to communicate their impressions. To captains and officers calms were not delightful experiences but sore trials, often ordeals; and if officers did not so regard them, captains seldom failed to force this view upon them. Few A.B.'s studied anything but the quality of their food, and to the cook there were but two phases of sea-life: that period when pans, held in place by a maze of wire, spilled their contents if filled above one-third capacity, and the time when, unleashed, they would hold two-thirds.

Let me, then, answering to none of these ratings, place on record my thoughts and actions during a calm.

As the wind dies away there comes a strange feeling of detachment—segregation. This cannot proceed rationally from lack of motion; for a squirrel running in a circular cage is as far from rodent companionship as he is when resting, and the routine of the ship was inexorable, storm or calm. No! Apart from some animal instinct, the only physical cause proceeded from the changed and ill-defined horizon, a melting of blue sea into blue sky.

That was indeed a startling change, for a sailor as unconsciously scans the horizon as a committee man scrawls on his blotting-pad. And how would a committee meeting proceed were all pads and pens suddenly withdrawn?

Ship sounds, unheard during a breeze, now became audible: the jolting of the rudder in its trunk; the swirl of water below the counter; the zip—ze-ee-p—zip, as a light swell ran along and broke under the edge of a plate on the water-line. Ropes whispered, murmured, creaked, begged to be left alone, or furiously abused each other, according to size; and at night one could fancy they spoke of things unmeet for man to know. Albatrosses and Cape pigeons sat as serene as geese and ducks on a mill-pond; only spreading their wings or squabbling over their one quest—food.

At midday I have thrown a bright disc of tin to a goodly distance, and have marked its pendulum-like, flashing descent for minutes. At such times I have imagined 'that inverted bowl we call the sky' to be resting its edge on as infinite a bowl styled the sea, with the ship poised for ever in the centre of space.

Land!—What was land?—There never had been land—in this existence.

In a previous incarnation, perhaps; for the

word suggested a place where nothing was at rest, where with daylight came ceaseless noise; a hard framework whereon millions of shuttles wove a confused, ill-understood pattern.

No! the universe was vastly blue and yielding; as above, so below and around—the planet I lay upon having an uncomputed orbit, but no destination.

Small living things would leave the ship's side and adventure a yard or so on the surface of the water, darting back when the sails gave a sudden flap. It seemed a miracle that such mites could survive the pressure of waves that stove in bulwarks; yet, upon reflection, their immunity is one with that enjoyed by short grass amid the gale that uproots oaks.

A time and a place for each; the man, the bird, and microscopic life. The sun that scorches the grass strengthens the oak's heart. Without calms, no trade-winds; for if here is energy, there must be rest. There is nothing really wrong, save views and habits.

Hence, during a calm, the same state of nature that made one placid would cause others to rave. What could ultra-moderns do with a conspiracy of circumstances that allowed them to get neither on nor out? It won't do, my masters; if the elements are calm, let us substitute human brain-storms.

Yes, to all who regard any kind of action as superior to inaction, to those who prefer sound, even discord, to silence, the cessation of wind and wave must ever be punishment.

But to quiet accepters of Nature in all her moods, to all who, at risk of being misunderstood, I must apply the term 'Thoreauvians,' a calm at sea never failed to induce as deep and equal a calm in their souls.

SONNET.

(Written on Shigi-san, one of the mountains of Yamato.)

I LOVE to roam these wide hills, wintry drest.

Their note is *quiet*: in these paths far-strayed,

And climbing, terraced fields, man has but laid

A soothing finger on wild Nature's breast.

The silhouetted pine on yonder crest,

And those in cloud-like, stemless layers arrayed

In soft relief against the valley's shade

Are still as pictures. So is sound suppressed,

That if a bird speak 'tis but to reveal

The rounding silence; while, along the pass,

Shaggy with last year's yellowing bamboo grass,

The blue-clothed peasant, tripping on his road,

With lightly-carried, yet so heavy, load,

Shares, not disturbs, the peace the senses feel.

L. R.

THE ADMIRAL'S SHORE DAYS.

CHAPTER I.—continued.

v.

'MA'AM,' said I to Mrs McCourt that evening, 'I note we've a second academy in the village. We are becoming a very centre of education.'

Mrs McCourt smiled. 'The air is healthful to the children, my lord,' she explained.

'This second school?' I said, lighting my pipe. 'It looks very small, very poor; but it may not be the fault of the mistress. Is she a gentlewoman, respectable and capable?'

'Yes, my lord—once governess in a private family. She is a widow, Mrs Spens, and does well. But Mrs Thayer, having Sir Cortland's daughters, gets all the young ladies.'

'I can name two young ladies, ma'am,' I said, 'or better, two Barbary savages, that Mrs Thayer shall not get.'

Next day I settled the matter, and three days later, with no disapproval, I perceived in the newspaper an intelligence which beyond doubt had been sent by Mrs Spens:

'The Lady Joyce Lamont of Bagenal and the Lady Cecilia Lamont of Bagenal, the daughters of the Earl of Axbridge, have entered the P. Spens's Academy for Young Ladies at Bagenal, Sussex.'

CHAPTER II.

I.

A JANUARY morning—with Joyce, red-eyed, tremulous lipped, roaming about the library. The child had been crying all night over her kitten, killed by young Gibsone's dog; and her hand had seemed so fevered to me this morning that I would not send her out into the raw air to school.

She came to a pause before a chair, on which lay a sketched plan of the action at Fair Bay that some printer had submitted to me, begging my criticism and correction. She studied the plan listlessly.

'Why did you mark arrows by these French names, *Le—Le Guillaume Tell* and *Le Généreux*?' I asked.

'Two that escaped from us, sweetheart,' I answered; 'sail of the line of Monsieur Villeneuve's division.'

She passed on, with a sigh—moved her book. 'Oh, why did you let Gibsone come through our park?' she said.

'A neighbour, my dear; and it saves him two miles. But I will see he does not bring the dog after to-day.'

'No, let him bring it.' She came back to the plan, and once more stared at it. I laid

down my pipe and opened my snuff-box with a sense of gratification. So Joyce was inclined to forgive Gibsone's dog? That was fine of the child. It looked as though Mrs Spens's academy, notwithstanding two recent and most flagrant misdeeds done jointly by my daughters, was doing Joyce good.

'Did *La Justice* frigate and *La Diane* frigate escape you also?' she asked, her eyes still on the plan.

'Yes,' I said; and then I laughed. 'She's twitting!' I exclaimed. 'She's out to twit Admiral Nelson and me! Go on, miss; find some more that flicked their heels at Nelson and your poor old father.'

She smiled wanly, with a little shake of her head in denial of twitting, and resumed her roaming, while I got a notebook from a drawer at my knee and set to transcribing some notes. I heard Joyce open a cupboard, but I did not raise my head. Presently when I looked up she was examining a light, silver blunderbuss-pistol, which a friend had given me years before. 'Is it charged?' she asked.

'It should not be,' I said. 'Tis a silly toy that is like to burst and blow your hand off.' Then, for fear that some one had loaded it in my absence, I went to her, took the thing for an instant, and, finding it empty, returned it to her hand.

I marked her glance stray to my case of pistols proper, which chanced to be on the escritoire. It would never do for her to idle with those. So before I left the room, which I did some minutes later, I locked the case in a drawer.

On my coming back Joyce was gone—the silver blunderbuss toy also. Not seeing there could be any harm, I worked on with my notes, to break off after a while as a thought entered my mind. What if Joyce asked one of the gamekeepers to charge the pistol for her? Surely the man would not be numskull enough! Surely not! But I got up. And then my eye caught the face of my watch, which had been beside me. Ten minutes before twelve. Young Gibsone and his dog, crossing the park as usual, would be almost abreast of the house! I picked up my hat and cane and well-nigh ran. I did not care about fifty dogs, but I cared about my Joyce's hand—it might be her face also, even her very life!

From the hall-door I could not see her. I sped down the steps, and pushed through the belt of evergreen bushes to the left of the drive—and there she was, moving over the grass a cable's length ahead of me, her hand behind her, the pistol shining against her dark-blue velvet frock. And coming towards her, not fifty yards from her, were young Gibsone and his gray dog—the dog trotting nose down by

Gibson's side. 'Joyce!' I cried. 'Joyce! Stop! Come to me this instant!'

She quickened her pace.

'Joyce!' I shouted, running hard. 'Joyce! It will burst and kill you.'

Whirling the pistol from behind her, she ran for the dog.

I saw Gibson stop amazed. Then, perceiving what was meant, he did a thing that I thought would save matters: he caught his dog by the neck and pushed it as much as possible behind his legs, holding it there. Joyce was some twenty yards from him then. She rushed on, bringing to at five yards, with Gibson bent towards her, speaking to her, and his struggling dog heaving now its head, now its quarters, clear of shelter.

She pointed the pistol, firing as she pointed—a puffing, crashing discharge. I had watched her hand. I could not think of Gibson at the moment. To my thankfulness her hand had flown back from a fair recoil; the pistol had held. Luckily three-fourths of its scatter-shot passed clear of Gibson; luckily indeed, too, he had whipped up his arm, which was by his legs as he strove to pen the dog; and luckily he was wearing high, thick gaiters. But, as it was, he got a taste in the shins that sent him swaying about with clenched teeth and clenched fists, moving his legs in woeful pain, while the dog, appearing to have suffered nothing, was making full sail for its home.

No need to detail what followed—my deep apologies to Gibson, and his ready, handsome acceptance of them, by which he showed himself a particularly worthy young gentleman—and the desperate scene between Joyce and me at the house, she in bed by my order, and crying as though she must wrench the soul from her little body, yet ever refusing to promise that she would not try again to kill the dog.

That scene left me profoundly wretched, having added considerable distress to my fright. Oh, ay, I was frightened—badly! My ruthless Joyce had fired with as much willingness to pepper Gibson's legs as to pepper his dog. She would have blazed vindictively at Gibson's head if it had been thwarting her—I was sure of it. I could see Joyce sailing deadly close to the gallows one of these fine mornings.

II.

Such were the earlier happenings of a day that took a strange, new turn about half after three in the afternoon. I was in an arm-chair by my library fire at the time, wretched, as I have said, and feeling none too well in body after my running. I was resting until my carriage should come round to take me to Lewes, where I was to be guest at a formal supper; and since I was wearing on my uniform coat what Joyce called my 'beautiful, great star' and other decorations that the child loved to see on me, I

was wondering if I should fetch her from her bed of punishment to sit with me. And then Laslett, my butler, came to me. 'Miss Thayer presents her humble services, my lord, and could your lordship receive her?'

'Mrs Thayer!' I said, in astonishment.

'Your lordship's pardon—Miss Thayer. The daughter, my lord.'

'Do you know her errand?'

'No, my lord.'

I hesitated, then reluctantly hoisted myself from the chair, and nodded. 'Let her come here,' I said.

This visit must mean that Joyce and Cecil had made some attack on the Thayer seminary. In the circumstances I could not refuse to see the woman.

The woman!

She was in gray-blue, from her gray-blue straw bonnet to her little gray-blue shoes of a stuff I believed was damask. Her eyes were gray-blue, dark-lashed, and of the biggest size. On each cheek—rather pale cheek—was a puff of pure bronze curls that you wouldn't match for prettiness in many a day's ride. She was slender—one of the slender mistresses I had seen in church, it might be, though I had not seen her face then, or those bronze curls.

And I had called her *woman*! Still, 'pon my word, what else was she, save she was a young girl? Throughout my bow I felt, somehow, an hundred years old. 'Your very honoured servant, ma'am,' I said.

From her curtsy she came shyly a yard nearer me, looking at my face, then looking for the briefest instant at my orders, then at my face again, in a manner as though her sight were uncertain. But, from her wide open, flawless eyes I was sure this could not be the case. Then, drawing back, she said, with a little, nervous, well-nigh pleading smile, with a little increased paleness of her cheeks, with a little tremble of her voice, 'I am come as—as an enemy, my lord. I came with great courage, but I think I have lost my courage. I hope your lordship will not—will not beat down my attack at the very beginning.' Her smiling lips quivered.

'Why, no,' I said reassuringly. I took my hat and cloak from an arm-chair opposite my own. 'I beg you be seated here and attack as long as you please. With your permission I'll sit too, to receive your fire.' I sat down. 'If it will aid you, ma'am,' I said, smiling—for, no matter what was coming, the visit was certainly lifting me out of my wretchedness—'I will open with a question. What have my daughters done to displeasure you?'

'Your daughters?' The gray-blue eyes regarded me, very wide, scarcely comprehending, it seemed. 'Nothing, my lord.' Then the eyes looked from me to the fire. 'My question, my lord—the thing I—I entreat your lordship to tell me, is'—her lips quivered again; her fingers

in their gray-blue gloves moved very nervously — 'the question is: how did my mother and I displease your lordship so greatly that you attacked us?' Her eyes came back to me. 'We are very helpless in face of an attack by your lordship.'

'I have attacked you?' I asked, with amazement, then instantly with a sense of guilt, as I recollected several things.

She looked at the fire again. 'You sent your daughters to Mrs Spens, not to us, who are the — the recognised school for ladies of birth and rank. That was an affront to us which surprised every one. But your lordship had a perfect right to choose Mrs Spens, and we — my mother and I — no right to reproach your lordship, though we should suffer seriously, since many parents would be anxious to follow your lordship's lead. But soon' — she hesitated, taking a deep but quick breath — 'but soon we heard that your lordship had said to some one — to two people, that you would not let your daughters go to "that ill-bred Thayer school."' She paused, looking still at the fire, giving her head a little shake of dismay. 'I think that has ruined us, my lord, that fierce attack which is spoken of everywhere.'

I eyed her with drawn brows, not meaning the frown for her, but frowning to think that careless, bad-tempered words of mine should have hit her school with force.

'Ruined?' I said.

She moved her head in assent, a gleam from the firelight slipping over the bronze curls. 'Nearly half our pupils are to leave us in the spring, to go to your lordship's chosen school. We think that all will have left us by the end of the year. So then we must close our doors — disgraced, and very lonely without our girls.'

'You lonely, ma'am?' I could not keep from exclaiming. 'You, with your young life?'

She was silent a moment, eyes still towards the fire. Then: 'I had looked to our girls to prevent my life from being — very lonely,' she said. 'I had looked to have girls always around me — in the schoolroom — on my walks.' She shook her head again. 'I had looked so much to hear them say to me such things as — as: "Ma'am, the mail coaches are coming up the road. Do you hear them?" "Ma'am, the sky above the hills is many colours. Shall we tell you the colours?"' She broke off with a slight gesture of her hand, with a woebegone smile. 'Oh, I shall be fully punished for displeasing you,' she said. 'Meanwhile' — she raised her chin and faced me, her eyes seeming calm, but a fleck of angry pink suddenly in her cheeks — 'meanwhile, I humbly beg your lordship to tell me *why* I am to be punished!'

'One instant,' I said, 'one instant before I assure you that you shall not lose your girls' — and how her face changed at that! I leaned towards her. 'There sounded to be some

strange meaning in what you spoke of loneliness and sky colours — some meaning I cannot fathom.'

'Nay' — her face was bright and protesting — 'nay, indeed I will not trouble your lordship with the meaning.'

'Yes,' I said; 'unless you would liefer keep it secret.'

Her eyes, on mine, widened ever so little, almost as though to bid me note them. 'I am to go blind — quite blind by early summer,' said she very quietly.

I rose out of my chair and stepped towards her, her eyes lifting as I came, so that I was looking down into them. 'What?' I said. 'You — with your pretty curls and sweet face — you, the sweetest slip of womanhood I've seen for ten years!' And then I stepped back from her, bending in apology. 'If you can see your way to forgive me, ma'am,' I said, 'if you can take into account I am but a rough sea-faring fellow, not used to holding back my words, I will ever remember your generous forgiveness, ma'am.'

I was too truly ashamed to look at her, this young lady whom I had insulted in my own house — until she spoke to me. Then I saw her face soft pink, her very brow and temples soft pink, her eyes greatly wide, seeming engrossed with my star and other orders.

'Your words were in kindness, because of my eyes,' she said. 'How can they require forgiveness, my lord? I cannot tell how.'

'Generous,' I said; 'generous.'

In grave thought I picked up a snuff-box from a table by me, and, turning the box over and over in my hands, I looked hard at her. 'I will not believe it!' I said. 'You — to go blind! Tell me, child' — the word slipped out — 'what physicians have you seen?'

'Lady Freeland took me to Mr Michaels, in London — one of the king's doctors.'

'Did he say —?'

'Yes. It is so sure that he gave me no spectacles. Something is dying, but without pain to me — except for a little aching. That will cease, and — and my eyes will not be shut, or look different from now. They will not look' — she drew a breath in which there was a shiver — 'they will not look "dead," or even blank, for which I am so thankful! But they will be quite blind.'

'I've no great opinion of Michaels,' I said; 'there are newer men, more skilled than he. *They* shall see you. I will arrange that. Yes!' I asserted, in answer to her gaze of surprise, of protest — and I tapped the snuff-box on my palm. '*They* shall see you — make a fight for you. I wish to wait upon your mother tomorrow, to win her consent to this. A pretty thing,' I said, perceiving her protest growing, 'if I should stand idle letting a child like you go blind! — A pretty thing if I should feel no concern for the tutor of a daughter of mine!'

'A daughter of yours!' Her surprise took a new direction.

'Yes,' I said. 'I will not use Mrs Spens so ill as to give both my daughters to you. But you and she shall have one apiece. What think you of that? Will it not repair the harm I have done you?'

She touched a puff of her bronze curls with a little, excited gesture, and breathed deeply; then her lips seemed to struggle against a smile of amusement. 'I think you—utterly kind, my lord,' she said, very earnestly, despite the coming smile. And then the smile broke forth.

As though in fear that it would incense me, she moved her hands in appeal. 'You have made me so light of heart,' she said, 'because you have saved our school, that—that I am nearly laughing over your plan. It is so—so impartial that it is very amusing. Do you not think so?'

She asked that entreatingly; and, had I detected no humour at all in my purpose, I should have pretended that I had, to put her at ease. As it was, I realised there was more than a hint of comedy about the apportioning of my daughters, and, on the point of telling her so, I chuckled; and at that she laughed softly, and I laughed with her.

'But, my lord,' she said then, 'you will believe, will you not, that I came with no thought of doing this—of winning one of your daughters from Mrs Spens? I came—' she paused, wavered as to what she would say, and then, smiling so prettily, gazing at me—'if it does not appear ungrateful, my lord—could I know how I displeased you?'

'It was not you, or your mother, that displeased me,' I said. I put the snuff-box on the table and sat again in the arm-chair. 'Let us say it was no one—nothing save my crooked temper.'

'I know it could not be that.' She leaned a shade towards me. 'Tell me, my lord.'

So I told her; and then vehemently wished I had not, because of the pink—unhappy pink this time—which had coloured her face and brow.

'I can make some defence of our academy,' she said, having been quite silent until I had finished. 'That behaviour was on three Sundays. It began because—I cannot say how truly—Mrs Spens was thought to have schemed to—she gave a tiny smile—to win away one of our pupils. On the first two Sundays I was not at church—my head was aching from my eyes—and my mother goes to earlier service. Therefore we knew nothing. I was at church the third Sunday, when you were. I was taken by extremest surprise when it happened. I looked, to try to see the cause. But I did not sneer, my lord.'

'You have never sneered in all your life,' I said quietly, confidently.

'After church, when we were at home, I—I bitterly unbraid them—our girls; bitterly

reproached the mistresses in private. They were all very sorry and shamed, my lord. You saw there was no unseemliness the next Sunday, or after?'

'Ay, I plainly saw that,' I answered—not confessing I had innocently believed this to be the result of my alliance with Mrs Spens—'plainly indeed. And you have filled me with regret for my ill-temper. And now,' I continued, 'if you can a little forget that temper, will you grant me two favours? Will you let me have a dish of tea brought here, and take tea with me, ma'am? And will you let me present to you a very naughty savage that is at present in her bed—for shooting a pistol point-blank at a young gentleman, ma'am, if you can credit me?'

And straightway I told her of Joyce, and asked her whether she would receive such a fierce bravo as her pupil.

At this, though she had fallen very serious as she listened to the tale, she smiled with returned happiness, saying that indeed she would receive her. And then, ere passing up word for Joyce to come to us, I spoke again of tea, aware that I was strangely eager to keep my visitor with me until I should be forced to set out for Lewes.

She looked—anxiously, I noted—to the window, to the sky; and though pleasure at my invitation was in her face, she hesitated. The gray-blue eyes returned to me. 'How long is it to twilight, my lord?' she asked. 'I must be well on my road before twilight, for I am so blind, so lost, in that.'

In the last few minutes, with her youthful prettiness holding most of my thoughts, I had more than half forgot the incredible thing she would have me believe she was fated to. Her words, giving me a picture of her helpless on a road in twilight, brought it back to me forcibly. They did more: they raised forthwith in me a pity of such quality that I—I, coarse-handed, elderly seaman—dared to imagine myself moving across that instant to this young lady in all her delicate prettiness, and putting my palms to the puffs of bronze curls and compressing them gently as I could against her cheeks; and, holding her face thus, telling her that we would fight to the last shot to save her sight, and, except Heaven forbade, we'd save it—then stooping and kissing her above the eyes, and, if her eyes closed, kissing their lids. Yes, I dared to imagine myself doing all that; for, 'pon my word, it was what I dearly should have liked to do.

No need to say, the only part of it I did—remaining fast moored in my chair the while—was to speak of the saving of her sight. Then: 'As for twilight,' I said, 'I am to drive presently through the village. If you will permit me to take you in my carriage to your door, ma'am, I shall be very, very honoured.'

With pink clouding into her cheeks again, she thanked me; and she agreed to return home thus.

Chambers's Journal

SEVENTH SERIES

A PHILISTINE IN FLORENCE.

By E. D. CUMING.

I.

THE guide-book conveys a false impression: it would have us believe that Florence consists of churches and picture-galleries, which is a mistake. There are other, many other, interesting things besides.

It is easy to see how the guide-book's mistake arose. It assumes that every one who visits the Tuscan capital is orthodox in the artistic sense; and ecclesiastical architecture and art in its several forms being the intellectual diet of orthodoxy, the guide-book does its best to satisfy the craving. The fundamental error, of course, lies in the fact that the existence of Philistine visitors is ignored. Philistines are not expected in Florence, but they find their way there—some, there is reason to fear, deliberately posing as orthodox persons.

Philistinism occurs in various shapes. It may be deliberately suppressed (which is a sign of grace); it may be latent; and it is often unconscious. Thus it comes about that orthodox visitors are shocked by the suspicion that there is a Philistine among them, when it becomes advisable to apply the usual test. The process is simple, and, save in the case of deliberate concealment, infallible. It is this: The suspect is lured to Santa Maria Novella, in which church hangs the famous Madonna of Cimabue. This work, as every one knows, was pronounced by the thirteenth-century critics the finest work of art ever produced. It created an immense sensation at the time; the citizens carried it in procession round the town, and then reverently deposited the treasure in the church, a resting-place at once appropriate, accessible, and secure. Orthodoxy has admired it ever since. The picture is invaluable—especially as a means of diagnosing Philistinism.

The suspect is placed before this picture, given a sketch of its history (it is only fair to do the latter), and an orthodox observer waits for effects. If the man strikes attitudes of admiration; if he says the right things—to be checked from the glowing page of the guide-book; if, in a word, he adopts the thirteenth-century opinion of the work, all is well. He may be passed sound, artistically speaking. If, on the other hand, he appears perplexed,

mutters such epithets as 'flat,' 'wooden,' and the like; if, as happens in confirmed cases, he falls to speculation concerning the art over which this of Cimabue was held so superior, and opines that thirteenth-century criticism was marvellous lenient, then the observer recognises in the suspect a Philistine, whose mind (artistically speaking) is incapable of improvement.

I write with feeling because this is my own case. I perceive in this achievement of Cimabue advance on the best efforts of the Byzantine school, and had I never seen anything better should admire it very much. But I am persuaded that if the shade of Cimabue were now to revisit the scene of his triumphs, it would be the first to acknowledge that much finer pictures have been painted since. Let Cimabue enjoy all the credit due to a pioneer who, greatly daring, set the stereotyped methods of his epoch at naught and struck out a line for himself; but let us be honest with ourselves, and not pretend his work is admirable when judged by later standards—or we disparage by implication Titian, Raphael, Rubens, and all the great stars of the art firmament.

II.

We leave these high matters to the orthodox. The Philistine discovers so much of interest that is ignored by the guide-books that he need not trespass on the artistic preserves. A walk through the streets leaves impressions, not invariably favourable, though to express other than indiscriminate praise of Florence and all that therein is savours of heresy. Thus you find reason to wish that the side-walks in some of these old thoroughfares were more than eighteen inches wide, especially when such narrow streets have been chosen for tram-routes, and the electric-car screaming past obliges you to shrink against the wall. You feel it would be an advantage if the crowds were less reminiscent of Oxford Street at sale time; if taxi-drivers and cyclists wouldn't display their unearthly skill in narrow shaves at your expense; if the men had somewhere else to stand about and vociferate. Apropos the crowds, the vast predominance of men over women strikes the insular eye. In an elder day social usage

forbade Italian ladies to appear in the streets on foot, and this inconvenient tradition to a great extent survives; hatless girls and women of the working-class—and some whose hats mark their higher social standing—there are in the streets, but they are far outnumbered by the men. It is rare even to see a lady driving. The life of the Italian lady in town must be dull. She doesn't go out shopping; she never goes out to afternoon tea. A medical man who speaks English once expressed to me his warm approval of the British practice of inviting friends to meals. 'But don't you ever ask a friend to luncheon or tea or dinner?' I inquired. He looked at me with the rising eyebrows of astonishment. 'No, not ever! If I ask one to eat dinner in my house he shall think I want something from him.' Which seems to indicate an alertly suspicious habit of mind in the Italian.

You see many beautiful faces among the Florentine girls, whose prevailing expression is one of gaiety and self-satisfaction. I do not question their right to look pleased with themselves—on the contrary; but the thing is so marked that it compels notice. Somebody suggests as the reason the plenty of men; but this opens up a field of inquiry we will not explore. One most attractive quality is common to all Italians—to wit, their swift and charming smile.

Turning again to the streets, you find reason to wish that the universal stone-paving were less uneven, or that rubber tires were in use. Doubtless it is the stunning clatter and roar of wheeled traffic that obliges the townsfolk to make their voices so audible; but there are always two points of view, and the Italians complain that Britons speak in a whisper. Comparatively speaking, this is correct.

Another vexation is the wind. It is usually blowing half a gale. The early morning is calm, but about ten o'clock the wind rises, up or down the Arno Valley, and continues till nightfall. Dante, as a Florentine, knew what he was doing when he made one of his places of torment a world where gales ceased not from raging. When there is no wind Florence is enervating.

III.

The number and size of the palaces suggest vast wealth owned by individual citizens of bygone days; huge prison-like erections in stone four or five storeys high, the owner's arms conspicuous on an outstanding shield without, the massive walls adorned with decorative wrought-iron sockets and brackets for the display of banner and torch—beautiful things that even the Philistine appreciates. Most of these old palaces, here as elsewhere, are turned to baser uses now—converted into warehouse, bank, suites of offices public or mercantile, hotel, *pension*—even tenement house or

'rookery.' A few still shelter descendants of the original owner—the Strozzi, for example, whose upper regions are inhabited by a member of the ancient family of that name, while the lower floors are given over to collections of old furniture, bronzes, marble, and the like—half sale-room, half museum.

These great Tuscan palaces are all built on much the same plan—four-square about a central court open to the sky, sometimes with a gallery on each storey overlooking the court, all the rooms on a storey opening one into the next; a common stairway to the top, where is frequently a *loggia*, open on three sides or all four, an airy resort in hot weather, and much used, we may suppose, in default of any garden.

An enterprising citizen has purchased one of these fourteenth-century town houses—the Palazzo Davanzati—and, furnishing it in contemporary fashion, shows it for a small fee. The equipment of the house is conscientious in its minuteness, including, among other details, a lady's night-rail and a gentleman's garment, the latter of patterned material cunningly wrought all over in silk with the Italian equivalent for 'I want the heart.' This was a usual gift from a fourteenth-century Florentine maid to her betrothed. The Palazzo Davanzati is the most illuminating sight in Florence, revealing, as it does, the domestic surroundings of a well-to-do medieval family. It is fair to the guide-books to say that they mention it.

The wealth of those who dwelt in such palaces must be discounted. Each was the abode not of a single branch of a family but several branches, and a few odd twigs besides, if the expression may be pardoned. The street doors—nail-studded, metal-sheeted, of size meet for a cathedral—open on the court and its arcades, where were sheltered the coaches, horses, forage, fuel, and so forth. On the first floor, whose rooms are the loftiest, dwelt the head of the family with his wife, children, and servants; on the second, lived a married son or brother with his belongings; on the third, another son or brother with his; and above him an assortment of cousins, uncles, and aunts, for whom family affection or regard for the family dignity provided house-room.

It says much for the domestic virtues of a turbulent age that this mode of living, Oriental in its acceptance of the claims of blood, should have persisted for centuries. Small exercise of imagination discloses the drawbacks. The mind's eye sees all those branches of the family, and with them the odd twigs, assembled in the *loggia* under the roof to enjoy the cool of the evening and the wide views over the city. The mind's ear hears Aunt Alexia's adverse comments on the misfit of little Atanasio's trunk-hose, her strictures on the defective frizzling of little Petronilla's hair—which are really not her business. Is it surprising that the

mamma of Atanasio and Petronilla makes a tart rejoinder, and relations become temporarily strained?

The servants too. Paolo, the serving-man on the first floor, waylays at the hatch the bucket of water Nicolo, serving-man on the third floor, was drawing up the common well-shaft in the thickness of the wall. Paolo passes it off as a joke, but Nicolo doesn't see it, and the two are out on their respective galleries exchanging compliments. That was the sort of thing calculated to bring knives into action. Yes, in this mode of living there was ample scope for friction, and worse. Yet, from the point of view of Atanasio and Petronilla, the system had merits—always supposing Florentine uncles to hold correct views of avuncular obligations; that an adequate supply of maiden aunts, however addicted to personal criticism, was invariably on hand upstairs would be a fortifying reflection when pocket-money ran short.

IV.

A popular resort ignored (undeservedly, as the Philistine thinks) by the guide-book is the hat market. Ladies visiting Florence never fail to put in a morning or two at the hat market. The plaiting of straw, from the coarsest to that of horse-hair fineness, and the working thereof into hats, is a great home industry in this region; in the suburbs and the country round, straw plaiting takes the place of knitting in Great Britain, and the fruits find their way to the hat market. Stall after stall is stacked with hats in all shapes, sizes, and colours, a looking-glass in the middle for the convenience of customers, who 'try on' regardless of the public eye—the market is only a roof upheld on pillars. Here the Florentine female is in heaven, for her life is one delirious round of chaffering. It is understood that she begins by asking twice or thrice the sum she will take for any given hat, and it is popularly supposed that she would rather sell at half-price than forgo the joys of bargain-driving. Anyway, she disposes of hats in quantity. Cheapness apart, there are excellent reasons for buying: the hats will roll up into compass so small, a dozen or two take no space when packing; so light, you may take a hundred and add nothing perceptible to the weight of luggage; so well made are they; so—in short, a woman of ordinary resource can find a separate, distinct, and sound reason for buying each of all the hats that take her fancy.

Florence can give other cities a lesson in the proper use of poets. What Shakespeare is to Britain that Dante is to Italy; but Italy is resolved that her people shall be familiar with Dante if the thing can be achieved by quotation that all may read. The references in his works to building and locality are frequent, and where he has thus conferred immortality you find a tablet engraved with the appropriate lines from

the *Paradiso*, *Purgatorio*, or *Inferno*, as the case may be. It is an ideal method of keeping the poet's memory green, of identifying his work with his city, if the people read these interesting reminders.

'If,' because the Florentines—and not only the Florentines—are so much given to the erection of mural tablets that these by sheer number, variety, and, it must be added, inconsequence, are likely to defeat their end. A case can be made out for that tablet, tombstone size, let into the wall on the Lungarno, which records the fact that at this spot, in 1847, Leopoldo Gargani jumped into the river to save a child. It does not appear that either Leopoldo Gargani or the child was any the worse, and this enduring monument gives to think. We decline to believe that Leopoldo is the only Florentine who ever risked his life to save that of another, but from this admiring inscription we might infer that his display of courage was something quite exceptional—an unjust reflection surely upon Italian bravery. That tablet to the memory of Giovanni Sartoni on the house in which he was born needs no justification. Sartoni was one of the thousand volunteers who joined Garibaldi in his expedition to Marsala—that forlorn hope whose success laid the foundation-stone of Italian unity. It was one of those adventures that make history, and every man who bore part deserves his monument. In a different category falls such a tablet as that in Siena which immortalises the circumstance that for thirty years dwelt in this house Antonio Gamboni, professor of Economics at the local college. But perhaps it were wise to refrain from question; not to know of Professor Gamboni may be to argue oneself unknown; and I present as another example of mural tablature the marble record which apprises the passer-by that Amadio Donati built this wall round this property in 1875. It is a brick wall about five feet high, and encloses the property—a market-garden of two acres or thereabout—from the public road; quite a good wall, but bearing marked resemblance to any other wall. Perhaps enough has been said to support the plea that the tablets deserving attention are in danger of escaping it by reason of the multitude that do not.

A feature of Florentine life concerning which the guide-books are reticent is the appetite of the populace for boiled beans. Wherever you go the pavements bear witness to the passion for this form of nourishment, bedewed as they are with those pale yellow husks ejected by consumers. The purveyance of beans is a street industry; at the point where a tram-service stops, in church portals among vendors of cakes and sweets, in nooks on the bridges, in the entries of converted palaces—in any corner, convenient or the reverse, crouches an old man or woman behind a large basket of cold boiled

beans, to be sold by the handful. The taste seems peculiar to Florence.

Because a few of the deficiencies of the guide-books (from the Philistine's point of view) have thus been brought to notice, let it not be sup-

posed that they are to be contemned; they have their uses—even their charms. Who would part willingly with a guide-book whose description of a painting is, 'Adam and Eve under the Science Tree'? Not I!

A GIPSY OF THE NORTH.

CHAPTER VII.—AN UNEXPECTED ENCOUNTER.

WORN out though they were with the toil of the long descent Carwyke and Norma paddled their hardest, keeping close inshore to avoid presenting the perfect mark they would have done on the open bosom of the lake. The sound of the ex-whaler's rifle reached their ears at intervals, answered by more distant shots, and just as they approached a long tongue of land the firing ceased. Carwyke listened anxiously, fearful that something had happened to Billy. As he reached the point beyond which Norma's skin-craft had already swept, he half-turned the kayak to look back. As he did so the distant firing was renewed, and he caught sight of Billy's kayak breaking the reflection of the rosy sky in the lake. He gave a shout, caught the whaler's answering shout, and, as he swept round the point, heard another cry, that brought a look of apprehension to his face.

He turned his craft to go back, and, as he passed the point again, saw his companion still coming on, but riding low in the water. The on-coming man shouted a warning, which was emphasised by a bullet splashing in the water a dozen yards away. Instantly Carwyke sought the shelter of the point, and waited in the lee of it. The firing still continued, and then after an interval of some minutes the ex-whaler appeared.

'Slippy, Mista Carwyke!' he shouted. 'This craft's plugged!'

Carwyke landed on the spit; and as Eskimo Billy, deep in the water, grounded, he helped to pull the damaged kayak ashore. A single look told him what had happened—a bullet travelling on the water-line had ripped a long tear in the skin body of the kayak, through which the water had poured. In ordinary circumstances it would have been easy to repair, but there was no time for that now.

'Dished!' said Billy, and without delay began to hand the stores from the interior, transferring them to Carwyke's craft. Then with his knife he deliberately ripped great pieces of skin from the damaged kayak, completing its destruction, and as he did so explained breathlessly, 'Those beggars haven't got their boat hereabouts, I'll swear! Left it cached somewhere backalong, I expect. Now, Mista Carwyke, yo'll have to carry me. I ain't no weight to speak of, an' I've ridden on ther deck of a kayak before.'

They launched the kayak, and Carwyke took his place, his companion laying himself on the craft behind him. Doubly burdened, he paddled on to where Norma awaited their coming. The firing behind had ceased, and, looking back, they could see nothing of their pursuers. Neither of the men believed, however, that the pursuit had ceased.

'Keep on steady, Mista Carwyke. We'll get ahead all right. The blackguards can't walk or run as fast as we can swim. Guess they wish they had their boat along now. They must have done what I said—come up another river, and waited for us to cross ther Height.' He broke off and chuckled. 'Well, we've crossed, an' now ther scoundrels is behind us, where they'll stop. But 'twas a blame near shave.—Hallo, Miss Norma, paddle on! There's no bones broke—only ther kayak gone to blazes. Make for the river thet runs out at ther head of ther lake. Lord send thet it's navigable!'

Utterly weary and worn out, yet sustained by excitement and the harsh necessity of the hour, they paddled on. The lake was some six miles long, and they passed the whole length of it in an hour and a half, and with the sound of rushing water in their ears reached the outlet.

'Rapids!' said Billy. 'We'll have to land.'

They did so; and Carwyke hurried to reconnoitre. Beyond the head of the lake the land fell abruptly away, and down a rather steep slope the outfall plunged in sharp descent, but when it reached the lower level it ran with a smooth, swift-flowing current, that promised easy and rapid travel. He returned and informed his companions, and without delay they portaged the outfit to the navigable waters; and, re-launching the kayaks, were whirled into a long valley, the sides of which were clothed with willow-thickets and jack-pine.

'Wonder where this durned river goes?' said Billy. Carwyke also wondered, but for the moment was content to know that it was hurrying them from Standifer and his crew. He said as much, and the ex-whaler gave a chuckling laugh. 'Yep! Thet Standifer must be cursing his luck just now.'

Using the paddles only to keep the kayaks straight, they swept forward. The valley opened out a little, and then Billy gave a shout, 'Big timber! I ain't seen ther like for years.'

A huge pine towered on the hillside ahead of them, and beyond it the timber showed in jagged lines, indicating that they were coming to a bleak and more hospitable land. Then as the valley opened more, a line of hills appeared, their tops bright in the light of the midnight sun, their bases in deep shadow.

Half-an-hour afterwards Norma, who was singing, gave a cry, and pointed at something in the distance.

'Story!' cried Billy. 'A house, as I'm a son of a gun!'

Carwyke stared. In front, scarce five hundred paces away, nestling against a pine-clad hill, was a long building. From its formation and the stripped fir in front of it, from which a mass of ragged bunting fluttered, it was some sort of trading-post or mission-station. His heart leapt at the sight. Their pursuers must at this time be many miles behind. That lodge in the wilderness in front would be a very welcome resting-place, and, dropping with fatigue as they all were, a very desirable one. He turned to Norma, who, as they approached the shore, had her craft inshore. Carwyke himself slipped his suit, making for a strip of sand which, where a trio of canoes drawn up there, seemed a fitting place. As he reached it he gave a shout, and from the low log-building a man of enormous bulk came running, then, as they drew the kayaks out of the water, stopped and stared staring in wonder.

Carwyke returned the stare with interest. The man was at least six foot four inches in height; broad in proportion, with a large face hidden in a big well-kept beard, which lay flat-wise on his chest. His small piggy eyes gleamed with amazement, and for a moment he seemed incapable of speech. Then he threw out his long arm and gave a shout, and in response a half-breed woman came running from the building. The giant pointed to the new arrivals, said something in a purring, spitting tone which Carwyke did not understand; and the woman, with but a single glance of her dark eyes at Norma, hurried indoors again.

'God save us!' murmured Billy. 'A Russian, I'll be bound! I wonder if he is that blackguard priest what——'

The Russian spoke to them at last in a great booming voice that quite drowned the excited and quieter speech. 'Where you come from?'

Carwyke pointed on the backward way. 'From the tundra, across the lake, and down the river—from the coast.'

The small pig-like eyes widened a little, and Carwyke as if to learn if he were being glanced contemptuously at Billy in his new outfit, then fixed themselves upon Norma.

They saw the wonder grow in them, as they looked from her native costume to her blue dress and golden hair; then the fellow, address-

ing himself to Billy, asked abruptly, 'The girl? She is yo' woman?'

'Nope!' answered Billy, a trifle explosively.

The Russian looked at Carwyke, but before he could repeat his question the wanderer shook his head. 'No.'

'Den who will she be?'

Carwyke saw no reason for withholding the truth, and offered a short explanation. 'She is the daughter of an American missionary to the Eskimos. Her father was lost on an ice-floe three years back.'

'The name?' cried the man, something more than curiosity burning in his eyes. 'The name?'

'The name of the missionary was Mannering,' answered Carwyke, wondering what inspired the man's questions.

'Good heavens!' The words came in an explosive bellow. For a moment the big gross face quivered with excitement, and the piggy eyes fairly glowed. That the name meant much to the man was evident; and Carwyke promptly shot a double-barrelled question, 'You have heard the name before? You knew Mr Mannering maybe?'

At the questions the glow faded from the eyes, and the fleshy face grew mask-like. Then the man gave a rumbling laugh. 'You haf make mestake,' he answered. 'Never haf I see Mr Mannering, an' the name I haf not hear before. But you will enter the house an' rest. Yes?'

Without waiting for a reply, the Russian turned and led the way towards the house. As he did so Eskimo Billy slid forward to Carwyke and whispered, 'Ther man's a liar, an' a dirty Russian. Watch out for Miss Norma!'

Carwyke nodded, and the trio followed in the wake of their giant host, who, stooping in the doorway, had turned to see if they were following. As they crossed the threshold he grinned affably.

'Welcome, pilgrims, to Little Novgorod.'

'Is that what yo' call ther place?' asked Billy, looking round on the primitive interior.

'Yes, dat is the name, after the place of my birth,' answered the man, combing his great beard with his huge paw.

'Well, I've never had the luck to hit ther port, but if it's anything like this——'

'It is a great centre of trade,' broke in the Russian with a noisy laugh, 'an' dis is the little centre, an' dat is the explanation of the name—dat an' my little self. But yourselves make at home, as the English say. Ah! To see you is great pleasure. You will eat; you will rest—one, two, many days?'

'Thank you,' answered Carwyke; 'a few hours only. We must push on.'

'Dat is to be regretted. But for the leetle whiles you are here we will be merry. You will drink of the vodka?'

He went to a shelf and took down a stone jar, then some tin mugs, into which he proceeded to pour the spirit. Carwyke, watching the proceeding, hastily interposed. 'A little only, my good man. We have come far and are very tired. A little will brace us, but the overdose would not be helpful—you understand.'

The man's great laugh bellowed forth. 'As you will. But when you haf eaten we will drink—we will drink the roof off!'

Carwyke picked up the mug that held the smallest portion of spirit, and carried it to Norma. 'Sip!' he whispered. 'A little only. It is fiery stuff; but a mouthful or so will tone you up.'

He picked up his own mug, and carried a third to Billy, purposely spilling much as he did so, his action hidden from the Russian in the half-light of the room. With a brimming mug in his hand, the trader gave another bellowing laugh.

'A happy meeting! Chin-chin!'

He swallowed the fiery spirit as if it had been water. Eskimo Billy, gulping the liquor, broke into a sudden splutter as it stung his throat, and coughed till the tears rolled down his cheeks, while the Russian laughed uproariously.

'Ha! Ha! Little father. It burn you!'

'Some!' answered Billy, wiping his eyes.

The Russian continued to laugh, rumbly. 'Another one,' he roared. 'We will the health drink of the little sister of us all.'

He poured fresh spirit into his own mug, and approached Carwyke, stone jar in hand. But Carwyke covered his mug.

'Thank you,' he said; 'I have sufficient.'

The trader laughed and turned to Norma. 'Little sister—'

'You would not have me drink my own health, sir?'

'Holy saints! No!' laughed the giant. 'But I, Nicholas Nicholovitch, will do dat—from my heart, little sister!'

He did it, with one hand on the fringe of his beard, where his evil heart might have been, but was not; then he roared menacingly, 'Marya! Marya!'

The half-breed woman hurried in, and proceeded to lay the rough table, and, watching her, Carwyke saw her dark eyes turn to Norma with something unfathomable in their depths; and all the time the Russian mumbled on, 'Dat Marya is a pig—a lazy pig, dat not even the knout can quicken—no wife for a man, you comprehend? And up here a man haf much need of company. When the snows are out an' the river haf freeze, an' the wolves howl in the valley, it is bad to be alone, and so Marya she stay with me. But she is no wife, no; and here a man could for a wife wish—such a man as I.'

He stood, and drew himself to his full height, then, stretching an arm, grasped one of the low rafters. 'Dere was not six men in dis land who could dat do, no!' He laughed again, and addressed himself to Norma. 'Hey, little sister?'

The girl, perhaps divining what was in his mind, made no reply, and the giant chuckled.

'And dere are not two men, no, nor three who could meet Nicholas Nicholovitch in battle without having the necks of dem broken.'

He looked this time at Carwyke, who wondered whether the vodka the giant had drunk was taking effect, or whether his words were a covert warning. The man himself dribbled on, 'But of battles we will not talk—we, who are brothers. We will together eat; and after dat we will haf the great drinkin'. Yes! For a meeting of the little brothers is a great thing.'

BRITONS HELD TO RANSOM: EXPLOITS OF BANDITS.

By HORACE WYNDHAM.

THE dramatic case that was recently reported from China, of armed bandits forcibly seizing peaceful travellers and holding them to ransom, has a number of parallels in the past. As a general rule, the scenes of these daring exploits have been the remoter portions of Europe; but Asia Minor, North Africa, and certain of the South American Republics have also earned an unenviable notoriety in this respect.

Turkey has a very unsavoury reputation for such outrages, which appear to be committed there almost with impunity. At any rate, it is very seldom that any one is brought to book. In 1896 an instance occurred near Smyrna, when an English officer, Brigadier-

General Marriott, was waylaid by brigands, who demanded £15,000, 'and no questions asked,' for releasing him. By good luck, the captive managed to make his predicament known to the authorities. The latter acted promptly, and, throwing a strong cordon of troops round the band, compelled the whole gang to surrender. But, as a preliminary, the military had to guarantee that the chief should not be arrested.

When a sufficiently large ransom is put up, the victims of such outrages are, as a rule, given their liberty at once; and even when the cash transaction is not completed, the usual custom among the bandit fraternity is to set them free after an interval of suspense. At any

rate, the old-time practice of forwarding a couple of ears, or a few fingers, to their anxious relatives (just to show that business is meant) seems to have been dropped.

The most daring case on record, one which (although now nearly fifty-four years old) is still remembered among the blackest annals of bandit crime, occurred in Greece.

Briefly, the grim story of this atrocious crime runs as follows: Towards the end of April 1870 Lord and Lady Muncaster, with whom were the Count de Boyl and three other gentlemen, accompanied by a retinue of servants and couriers and a military escort, were making a sight-seeing expedition in the country round Athens. The tour being completed, they were on their way back one afternoon, when they were suddenly 'held up' by a gang of brigands near Marathon. The escort (probably in league with the attackers) ran away as fast as their legs could carry them, and the unfortunate travellers, thus left in the lurch, were made prisoners. Their fate was soon settled, for the chief of the ruffians calmly announced that he would cut their throats unless they produced a sum of £25,000.

Confronted with this alternative, the party decided that the best thing to do would be for one of their number to return to Athens to raise the money. After some discussion, the bandit chief allowed Lord and Lady Muncaster to go, while he carried off the others into the interior as hostages. When the Greek government heard what had happened, they despatched troops to effect a rescue. Furious at what they regarded as 'treachery,' the gang then murdered all their prisoners and fled to the mountains. After a long and stern chase, carried out with relentless vigour, they were arrested, carried back to Athens in irons, and hanged as a warning.

Brigands appear to have flourished in Italy from time immemorial. Most of them gravitated towards the southern portions of the country, where they still seem to have a good many lineal descendants in hotel-keepers and cab-drivers. Yet, with a view to stamping them out, the authorities have always subjected them to very stern punishment. Thus, one of their number was sentenced to be 'beaten to death with hammers' at Naples; and the 'famous' Fra Diavolo (whom his weak-minded compatriots regarded as a 'hero' of the first water, and round whose nefarious career Auber wrote an opera) perished on the scaffold. The biggest ruffian of all, however, was Don Ciro Anichiarico, an ex-priest. This blackguard confessed to having murdered dozens of people. When a brother priest expostulated with him just before he went to the gallows, he told him they were 'both of the same profession.'

The islands of Sicily and Corsica have furnished several examples of bandit activity during recent times; and travellers are warned by police and consular officials not to wander far

from the towns. Some years ago an English clergyman and a friend fell in with a gang of brigands near Taormina, and were relieved of their purses; and there was another case a couple of summers ago.

Most of the recent cases of holding British subjects to ransom have occurred in Morocco, where life is always wild and lawless. A distinguished victim of unwelcome attentions of this sort was Kaid Sir Harry MacLean, who was carried off by a party of Moors in July 1907. What made the exploit all the more daring was that Sir Harry happened to be the commander-in-chief of the Sultan's bodyguard. Still, this did not avail him much, as he was kept a close prisoner for seven months. Raisuli, the head of the Riff tribe, who brought off the capture, was something of a profiteer in the bandit world, as he demanded £5000 down, and £15,000 to follow, as a suitable ransom. After a good deal of haggling the British government agreed to pay this, but only on the understanding that the Sultan himself would refund it. This undertaking, it is interesting to note, was honourably discharged by his Shereefian majesty, Mulai Hafid. However, he doubtless got it back (and a bit more) out of the rascally Raisuli, for the Moorish authorities have ways of their own of extracting cash from their subjects.

What is perhaps the latest authenticated instance of an Englishman being held to ransom occurred in Mexico a couple of years ago. The victim was a demobilised officer, Major Johnstone, who was seized by local members of the far-reaching bandit industry, and promised a very violent end unless he chose to pay £5000 for his freedom. The gallant major, however, was not afraid of a pack of Mexican desperados, and refused to pay up either a brass farthing or its equivalent in the currency of that part of the world. When they saw that they would get nothing out of him that resembled cash, the brigands restored him to liberty.

The Mexican minister in London, when applied to for compensation, returned the official answer, 'No funds available for such a purpose.' Still, that little *contretemps* of this description were not entirely unknown to his government seems obvious from his further remark, 'All such cases are carefully considered on their merits.'

Evidently, present-day life in the wilds of Mexico is not exactly humdrum.

WHERE ROSEMARY GROWS.

WHERE rosemary grows,
So straight and so tall,
Some one has memories
Sweet to recall.

And where there's lavender
Gathered apart,
Some one keeps memories
Sweet in her heart.

ELISABETH S. FLEMING.

THE ADMIRAL'S SHORE DAYS.

CHAPTER III.

I.

THE doctor, Michaela, had been right—more than right. *Before March was ended her sight had completely gone.* The final ebb of it had been swift beyond anticipating. Joyce gave me the news on my return to Bagenal from Portsmouth, whither I had gone for a week to look at the fitting-out of my flag-ship, in which I expected to put to sea by mid-May. There was in what Joyce told me this much consolation: Miss Thayer came, just as hitherto, to the schoolroom, teaching without a book, and went walking with the girls, though now one of them must hold her hand.

'Tis I hold it,' said Joyce, taking my cloak and hat from me—we were in the hall-way—'for she knows I love her.' Joyce gazed down at my cloak. 'You have torn your cloak with a nail at Portsmouth,' she said—then: 'I am very sorry now I pained her by seeking to have Gibsons's dog—physicked—and by throwing a sickle at Jim, the stable-boy. I did that—the evening you left. I meant only to frighten Jim; he'd disobeyed me. The sickle cut his arm—not badly.'

I took a pace or so up the hall, making a little hiss with my breath. 'Here is another that you love, yet load with pain—Miss Thayer,' I said, and turned. 'Has she not enough to bear without that, think you? You will make me no promise. What if you promised her to do no more ill things? It would gladden her, Joyce—gladden her very much.'

Joyce shook her head, gazing on at the cloak. I stopped by her, rested a hand on her shoulder, wondering whether to repeat my plea, thus making her unhappy in these first minutes of my return, or whether to wear away from the subject. Joyce spoke.

'It was Mrs McCourt told Miss Thayer of the sickle,' said she resentfully. 'She spoke above twenty minutes with her, bidding me wait in the chariot, in the cold! That was afternoon, and in the morning Miss Thayer's face looked as though she had wept all the night. Maybe that hastened her blindness. McCourt must have told more than of the sickle. McCourt is a venom-tongued scold!'

'Be quiet, miss!' I said. 'And bear this in mind—Mrs McCourt has given all her days to serving your family.' I tightened my hand, questioning, on her shoulder. 'Was there aught else for Mrs McCourt to tell of?' I asked.

'Not then. I aided Cecil against McCourt and Ann this morning.'

'What do you mean?'

'Cecil did not want to go to school, for fear

of missing your home-coming. McCourt and Ann strove to force her—to carry her to the chariot. Of course I would not endure to see her handled. Oh, nay! I took her from them. She is locked in McCourt's room now. McCourt locked her up when I had gone to school. I would have freed her, but I heard your carriage.'

I let my hand sink from her, pretty well despairingly, and softly hissed my breath again. 'Child! child!' I said; and then, scarce knowing what to say, added, 'You, then, went to school?'

She nodded. 'I went afoot. McCourt would not take me, and forbade Harry Digg to drive me. I am sorry there has been—disorder, when you so asked us to make none, but—' She broke off, looked at me with sudden appeal in her face. 'There is one other thing, but I cannot understand I am to blame for that. To-morrow is Wednesday, when I was to have brought Miss Thayer to take tea with us—'

'Was? You are to bring her,' I said sharply.

'She will not come. She begs you excuse her.'

'Now, look here, Joyce,' I said, 'what is the plain meaning of this?'

'I do not know. I am honest, I do not.' And the child's eyes, on mine, were very honest.

'You shall take her a letter to-morrow,' I said. 'Read it to her, and tell her, moreover, we—we entreat her to come.'

And presently, when I had seen my Cecil, and devoted a space to soothing poor Mrs McCourt, I went to my library and wrote the letter; after which, taking some snuff, and getting a pipeful of lower-deck under blast, I pondered for a little.

It was from a sense of duty, and clean against my inclination, that I had gone to Portsmouth, using up, what with journeying thither and back, well-nigh a fortnight of my dwindling time ashore. I had wished intensely to spend those dozen odd days at Bagenal—my reason, Mary Thayer.

Since that afternoon when, all in gray-blue, she first had entered my library, I had contrived to let scarcely a day pass, except for the late dozen, in which I did not get a word with her. And there had been one string of truly memorable days when, with the school left in charge of an aunt of hers, she and her mother had travelled with me to London, where I lodged near them, escorting them to various physicians, and, after the hopeless report of each, rallying our spirits by hastening to such entertainments of the town as her eyes would not prevent her enjoying.

On our return from London I would frequently displace Mrs McCourt in the matter of fetching Joyce and Cecil from their schools at an afternoon—receiving Joyce from Miss Thayer's hands. If I did not drive down thus, it was, almost certainly, because Joyce was to bring her to pass the early evening with us, after which would be that taking her home in my carriage or chariot, her arm touching mine all the way, and I wondering if I could convey to Fred later on that he was not to drive so fast on these occasions.

The evening before I went to Portsmouth, the weather being most fine, we had not driven, but walked, she holding my arm for guidance in the dimness. I had determined ere we set out that on this walk I would ask her what I could not much longer endure to keep from asking her—to wed me. But when it came to the time I found that Ben Lamont was still what he had been for weeks and weeks past—a rare coward for fear of offending and losing her. I was no bright young spark who might catch her affection quickly, but an elderly, widowed man. I had not known her long enough—I should affront her! So I argued to myself whilst talking lightly enough on other subjects to her, with her answering blithely and unsuspecting of my thoughts. Then, after a mile, I took a desperate hold on my courage,

drew a breath before asking her, and—forth from a cottage, carrying his lanthorn, came old Mr Maunsell, the parson, so pleased that now he could illumine our path to the village that I was not able to find heart to tell him he was come a little before he was signalled for. He convoyed us every step to the school; and within, Mrs Thayer received us, and saw no reason to leave us together for a minute.

And next morning I had started for Portsmouth—duty! I pressed my finger impatiently into my pipe bowl. Why had not I delayed a day, and so asked her? Why had I gone at all—been absent when blindness descended on her? Now I had but seven weeks before sailing, which gave brief time for married life—if she would have me.

If!—If she had affection for me, why would she have me excuse her from coming to-morrow, stating no cause whatsoever?

I smoked another pipe over that, finding no answer—finding my prospect dark. Then, perceiving that if I did not distract my thoughts I should presently be ordering out my chariot and going to her, which, at this time of the evening, would cause a flutter in the school, I went back to my *escritoire* and wrote doggedly for an hour to Smythe, who was captaining my flag-ship, anent those orlop deck fittings of ours.

(Continued on page 133.)

CLIMBING A PEAK IN DARIEN.

PART II.

VII.

RELIGIOUS geography is part of the art of living. To come to each new place on the chart called Earth, not in a spirit of mere pillory, but with some reverence, gives a richness to life. Whilst some seek gold, others seek spiritual gold, the soul's possession, which is neither sentimental nor unreal, but is, indeed, the one substance out of which, in the beginning, all things were made.

The apology of a world-traveller that he did not see the Pacific before from the heights of Tehuantepec, from the Golden Gate of San Francisco, from the stone eminence of the new city of Panamá—he preferred to see it with Balboa's eyes, climbing a peak out of the jungle and looking also and in like manner for the first time, in that way to perform a geographical rite in the world-temple.

I travelled with Cecilie Lucarez and Victor Morales. One carried my pack and a gun; the other with his long knife slashed the passage clear of jungle growth. It was icy cold and burning hot at the same time, dank and steaming; perspiration soaked even through the leather of one's knee-boots, but small cold airs

crept out of the profound green shadow on either hand, chilling for moments the very marrow. Underfoot were innumerable water-currents and mud and slime, and the giant trees above us dripped water all the while. A grave-like coldness crept about everywhere, and now and then a draught of air would lift my wet shirt and make it flap against the skin. Yet it was burning hot.

The Spaniards plunged across the isthmus in chain-mail; I was in my shirt, the Spanish negroes without even a shirt. That the Conquistadores did it in complete armour gives a measure of the physical endurance of these men.

The ground is strewn with rotting yellow plums, which have fleshy centres and a bitter-sweet taste; monkeys hang from the trees looking at us, parrots innumerable flutter about the open spaces. And when we come to open spaces, how painful the sun!

It is easier to cross the isthmus in January or February, the dry season, but Balboa crossed it in the wet. It is his September, and rains every day, as no doubt it did then. Up to the knees in soft mud, up to the waist in water each day, and the feet all swollen and broken by the treatment. The guides, with their bare feet

and legs, seemed able to take the floods more easily; and Morales in mid-stream of a rushing torrent, with my knapsack balanced on his head and his gun on top of that, whilst water foamed against his bare breast, was a sight not easily forgotten. Apprehension of a lost knapsack stamped it on the mind.

We rested in a jungle village. I sat on a clay floor, with a wild monkey on a string, and noisy children, and scarcely less noisy parrots. We were regaled with kola wine, and grated coconut, and oil, and rice, and bits of fat pork, and some of the ugliest preserves I have encountered. It was the time of the rice crop, and rice in the husk was drying in baskets in every little palm-leaf hut. Every hour the women took the rice-baskets and shook them to help dry out the grain. Next day an aged negro with grizzled wool led me on, and we found in the depths of the thicket that which I could not follow from *Nombre de Dios*—part of the *Camino Real*, now moss-covered and green, but unmistakable, a massive cobbling of large stones with a lateral upturned stone along the edge for curb, just room for a panniered ass and no more, but now so overgrown in places that even a monkey could not pass on it. Trees have shot up and split the cobbling, the scrub has met over it, and for many miles it climbs amid the mahogany trees high up into the mountains.

It would be worth while for some one to employ natives and spend a month cutting clear and tracing this great treasure-trail all the way from coast to coast; for there must have been resting-places, and perhaps even taverns, upon it, and possibly a chapel half-way.

The 'Speakities'—the coloured people of the jungle—all believe in lost treasure, and are superstitious regarding the evil spirits which are guarding it. Some have even bits of Spanish gold which have been found.

We made but slow progress in the jungle. Rainy weather and consequent mud held us. I changed my guides three times. None cared to go far from home. Two nights were spent in the scantiest shelter. Thousands of flaming fire-flies lit the floating mists, which along the edge of a jungle clearing looked like phantoms living in dark houses. The wraiths were of unstable dimensions, now swelling to a bank of mist, now tailing away to nothingness. But the fire-flies lighted their way—myriads of fire-flies. I lay in all the clothes I possessed, and in my boots, and wearing gloves, but still the mosquitoes bit. How combat a foe that you actually take in with your breath?

Tongues of fire among white mists in intense darkness, howling of monkeys, the creaking and wailing and prolonged z-z-z of insects in the trees, mosquitoes as noiseless and attentive as breath, the air not vital, suffocating—of such were the nights. In a hotel you would turn and turn, but something in the jungle constrains

you to lie like one dead all the night long, and that something also banishes thought.

There breaks out the throb of a native drum, one only, but you cannot say where it comes from. It is far away, it is close at your ear—it is wandering in the jungle. Who could be beating it, and why? But it is no matter. Your eyes close; you fall into a light slumber and lie dreamlessly—you cannot estimate how long. But suddenly horror breaks upon your soul. You start up, you look around, you fall back in a cold sweat. A roaring as of lions has torn through your consciousness. You think a puma has found you, and then, as suddenly, you laugh and relax. It is a pack of night-howling monkeys, beating their hairy breasts high among the branches and howling like lost souls. A vague thought enters the mind—the lost souls of those who murdered Indians for their gold.

Morning comes, and proves that each bad night was but a bad dream, a nightmare and not God's creation; for even over the 'white man's grave' it is fresh, with fair rose colours in the sky.

The natives think that I am a *gringo* surveyor planning a new road, and are quite pleased. They have never heard of Balboa or of Drake, or, indeed, of any one except Morgan. They think the *Camino Real* was built about fifty years ago. They know nothing. But I found them extremely dignified and courteous. The women seemed especially modest and discreet, and those stories of the Speakities selling their young girls for a few dollars, and of the Indians selling their children, are not true, except of the people on the coast, those corrupted by traders.

The men and women are not 'married,' but then there are no priests. Religion is nothing to them, but something of ethics is instinctive. They are said to be poor workers. It is hard to tempt them out of the jungle to do a day's work for pay. They do not want a victrola or a five-foot shelf of books. A few bright cottons for the women and powder for the men are all they ask. Money is scarce. In the depths of the jungle Chinamen keep little stores with a daily turnover of about twenty-five cents. An opened packet is a stock of cigarettes, and they sell them one at a time. They will even sell a half of a cigarette—the only people in the world who would undertake such a trade.

I wondered at the swarm of children of these Chinamen, begotten of their black wives. 'What will you do with them when you make your fortune?' I asked one.

'The best boys I take with me to China—the rest I leave behind,' he said.

I found that in the native huts I never had to pay for hospitality. It is true, however, that whole families enjoyed my provisions—gloated over tinned milk, drank mug after mug of dense *Nombre de Dios* coffee, ate chocolate as a wonderful novelty. In return, they would put in

the midst of the red mud floor a large pot of rice and pieces of smoked fish and forest berries soaked in brine. They brought down branches of fat little cream-coloured bananas from the roof. A parrot would lift itself by its beak on to my fingers whilst I ate, and in the same way up my coat to my shoulder, calling and outcalling its mate, who was perched on an ox-limbed woman in coloured overalls. In such a hut I met Martinez, a man with no hands and only one eye. He had lost his members dynamiting fish. Martinez had hooks tightly corded to the stumps of his wrists, and had learned to do all that most of us can do with hands—thus, he struck a match and lighted a cigarette, he shouldered my knapsack, he lifted down an old gun from the wall, he slung it on his back. Even using hooks for hands he was a good shot with a gun.

Martinez was by temperament a hunter, and was less interested in getting me to the Pacific coast than in following trails of wild beasts. He showed me a tree-sloth hanging in the hammock of its own body high up among the branches; showed me a boa coiled like a cable and sleeping like a babe. That did not interest him. But the jaguar and the puma were ever in his thoughts. We came upon the footprints of a tiger, a *grande gato*, a perfect six-spot in the mud. With bent back and staring eyes Martinez was for following it, and he gave me his long knife. But I said 'No.'

'No carey?' he inquired, raising his brows. 'No quiere?'

'No, Martinez; grande gato make nice meal you and me. Sabe, Martinez?' I made signs to him, pointing down my throat.

'Ah, you no carey?' he rejoined sadly, and set his face toward the sun. He threaded his way to an isolated hut surrounded by bog, where lived a bachelor acquaintance more ready to follow up the trail of the tiger. There we brewed coffee, and as I sat in the doorway sipping it, I saw fly past like a flame the most beautiful bird I had seen in the jungle. The sportsmen missed it, but heavy as I was with clinging mud I started up to follow it. I was tired enough of tramping, wet to the waist, mud to the knees. I had fallen down several times. Handless Martinez had offered to carry me across one or two morasses and torrents, and had actually raised me on his shoulders once, but I felt him waver under me, and took my two hundred pounds down from his back. I was glad when we came once more upon a stretch of the *Camino Real* and could actually walk upon it. We stepped steadily upward, and I began to meditate climbing that 'goodly and high tree,' for there were many such starting out of the marsh and scrub and going straight to heaven. But then, suddenly and unexpectedly, coming out on the scarp of a commanding ridge, I saw the ocean. I did not need to climb a tree. From

this ridge I also saw the Pacific for the first time, far away, a blue triangle of water beyond the hills and the forests and the ridges. There was a wide and majestic view, and the great trees of the jungle made a framework on either hand like the extended plumage of an eagle.

To my one-eyed guide it meant nothing, and he could not understand why I paused in the way and called him back. But it was a great moment. A warm current ran through my veins, and something seemed to lighten heavy boots. Wings came out from my heels, and I stood on tiptoe and stared.

That phrase of Keats, 'a wild surmise,' came very near to naming the feeling of rapture. The eyes of Vasco Nuñez de Balboa, the eyes of Francis Drake, the eyes of the one of the many! 'It was all for this,' I whispered.

Martinez restlessly waved his hooks and peered at me one-sidedly. 'Grande oceane,' said he reflectively as we resumed our tramp, and he led me to the sea. It was many hours, but they went easily, and we came out to the shore in the peace of the late evening, and there in a little inn we drank *blanco seco* and toasted Vasco Nuñez de Balboa and Francis Drake, whom certainly the one-eyed man did not know. Then I counted out silver dollars for Martinez and paid him off. And he was pleased.

Balboa, it is said, knelt on the mountain alone, and then his comrades came and planted a cross. And the pious chronicler avers that *Te Deum Laudamus* and *Te Dominum Confitemur* were sung. The dog Leoncico barked for joy. Balboa in a loud voice claimed all that was visible for the King of Spain, and the lawyer, whom they had brought along, drew up a deed which was signed by sixty-seven Spaniards—all that were left of the original hundred and ninety.

Balboa then marched to the sea. Pizarro, one of his companions, afterwards conqueror of Peru, was the first to reach the shore, and with two others they entered an abandoned canoe, and were thus the first white men to sail on the Pacific. Next day Balboa took possession of the ocean for the King of Spain. He did not throw his ring in the water, like the Doge of Venice taking possession of the Adriatic, but, clad only in his shirt, he marched with twenty-six of his comrades into the waves. In one hand he carried a banner of Castile; in the other a naked sword. They stood around Balboa, Pizarro, and the rest; they made crosses of steel, they kissed one another's sword-hilts, they lowered the crimson banner to the water. It had been morning on the mountains, and was sunset on the sea—the light of vision and then the many colours of glory sinking towards oblivion. With me also there was some of the light of romance in the glamour of the evening on the shore of the southern sea.

THE END.

HUNTING BOB.

By PHILLIPPA FRANCKLYN.

I.

'HE ain't a beauty, he ain't!' said Joe Curtis, as he indicated the dog that crouched at his feet. The animal's torn ears quivered grotesquely, as if he understood every word that his master was saying. 'What with being one leg short, and a saddle mark what a grizzly gave him as a token of affection, he's about as ugly a cur as you'd meet in the whole of Canada. But if he's ugly, he's cute, and as a bear dog he can't be beat. Indian dog? Well, what of that? I don't care a hang that his parents were two bear dogs belonging to a Cree Indian called Minosi. Hunting Bob saved my life as well as Minosi's, and, if you like to hear the yarn, well, here goes.

'I was up in the Peace River district a few falls ago. Game was plentiful, and as to bears, they just swarmed. The saskatoon bushes were heavy with berries, and the brutes had come for miles to get that fruit. You could see their trails on the bald bluffs, as well as the tunnels they had scooped through the dense berry bushes.

'I'd come up the river in a Cree dug-out, and landed opposite a big berry island, and struck inland. It was late September, and I kept my eyes open for bears. Not that I wanted them—their skins were too unprime to be worth the trouble of taking—but I'd my eyes skinned for probable spots for their denning-up, and a harvest of skins in March and April.

'I hid my dug-out, and packed my goods along the trail, which led, a half-breed had told me, to a deserted shack. He said it was only a mile from the river, but that mile multiplied itself considerably before I reached the place. I expressed my feelings loudly long before I reached it, but he was right about its being sound, and the surrounding country being good trapping ground. It didn't take me long to take possession, and in a few days I'd fixed upon my line of traps, and before the first snow fell I was as comfortable as possible with a good store of wood and food ready for the winter.

'The wolves had been making a considerable fuss around the shack, and, as I was keen upon raking in a few bounties, I set a series of traps. Timber wolves are always extremely wary, so I caught only one, and the rest apparently left the neighbourhood, for I heard nothing more of their midnight music. By this time the other trapping was in full swing, and after baiting the wolf traps, I left them for some days.

'One morning, when out in that direction, I heard a dog howling dismally. On investigation I found a miserable, half-starved Indian

cur caught in one of the wolf traps. I was considerably surprised, for I didn't know that there was a single Cree in the district. The poor little brute had evidently lain quiet until too starved and bad with the pain to stand it any longer. He cowered miserably when he saw me, apparently thinking that I should knock him on the head. His leg was too hopelessly mangled to be saved, so I cut it off, and bandaged up the stump as well as I could. It's strange how these Indian dogs get over an injury. In a few days he was hopping around quite contented and happy. Not that he settled down, not he! He was always on the hunt up and down the country, sometimes for hours, often for days. My mate, Jim Dawson, who'd joined me by this time, declared that the dog was hunting for his master.

"He's young, and he doesn't know the way to their winter hunting-grounds."

'I doubted his being very young, for even then he'd a considerable number of scars upon his hide, and I said so, asserting that if I got the chance I'd buy the brute; for I'd taken a fancy to the dog, he was so precious cute and ugly.

'One day a young Cree lounged up. He knew the dog, and said it belonged to Minosi. At any rate Hunting Bob was glad to see the Cree, and when he left went with him. The ungrateful little brute never even said good-bye to me, but dotted off, wagging his skinny tail as if he was perfectly happy.

"Once an Indian dog, always an Indian dog," said Jim, with his widest grin. "They prefer to be half-starved in an Indian *tepee* to having their fill in a trapper's shack."

'I felt pretty sick about it. I missed the dog with his queer, cute ways. However, there was no good crying over spilt milk, and I had to reconcile myself to the brute's desertion. I had given him up for lost, when one morning I was surprised to see him come bounding out of a windfall. He hurled himself upon me with every expression of delight and affection. Then, in the most absurdly bashful way, he attracted my attention to a young bitch that crouched close to the windfall.

"The brute!" ejaculated Jim. "Who'd have thought of his bringing back his mate? Wonder what Minosi will say?"

II.

'Even his mate could not keep Hunting Bob from hunting. He hunted in season and out of season, everlastingly hunting something, even if it was only the jack-rabbits that were pretty thick around the shack. Nothing came amiss.

'I was somewhat surprised that Minosi did not come and demand payment for his dogs, but he never came near the camp. I rather wanted to see the old fellow, for I'd heard no end about his always hunting grizzlies with nothing better than an old gun—how he scorned to use anything but the ear shot, and always hunted alone.

'By this time the stream and swamps below us were frozen over, although the winter had not been as severe as usual. So I was not surprised to come upon the trail of a grizzly doing a walking winter. I was not anxious to meet him, for a grizzly on the tramp in winter is a holy terror. His temper at the best of times isn't sweet, but when he's on the tramp he's hungry and mad. In fact, he's an incarnation of everything fiendish and devilish.

'The grizzly had evidently been fishing in a small space of unfrozen water in the swamp, and had had no luck. His trail led in and out of the snowdrifts, apparently in an anxious search for food. You may guess I kept my eyes skinned for a sight of the brute. I had only a light gun I used for pot-hunting, and it would be as useful as a pea-shooter in a fight with a grizzly.

'But I wasn't destined to meet him just then, nor did I come across any more of his trails. Jim was eager to have a shot at the brute, but I talked him out of the project. Our line of traps extended in a ten-mile circle from the shack. We usually worked out in opposite directions, and met in the centre of the circle, some miles away in the forest. If we didn't meet, the first to arrive at the centre trap made a blaze, and returned to the shack at once without waiting for the other. One day Jim had finished his line and returned. When I came back to the shack he was sitting in front of the stove frying Johnny-cakes. "I've spotted your grizzly," he announced, with a grin. "He's a bully brute, and no mistake. I'd have gone for him, but my gun was too light. However, to-morrow I'll interview his lordship to some effect."

"Don't be a fool, Jim," I ejaculated, my mouth full of Johnny-cake. "You'll bite off more than you can chew. Leave him alone until the spring."

'Jim grunted. He was always set upon having his own way. I knew he was determined to tackle that grizzly single-handed, and I might as well sing to the moon as expect him to listen to me when he didn't want to.

'The next morning I was off 'most before dawn, while Jim was still snoring in his bunk. Bob and his mate were away on a hunting expedition of their own, and did not return when I whistled. I felt fair nervous that morning. I'd taken a holy scare of Jim tackling that grizzly on his lonesome. So, when I came to the end of my line of traps, instead of cutting back to the shack I started through the bit of

forest that stood between the two lines, and continued down Jim's half-circle.

'Everything was unusually quiet. I'd never noticed how quiet everything was before. Not a single sound echoed through the trees. Suddenly, running as silently as a fox, Hunting Bob and his mate dashed past me. Almost immediately I heard them giving tongue furiously at some little distance ahead. Mingling with their yapping was the wheezing protest of a grizzly. I heard a faint hail, and remembering Jim's words, I dashed madly down the trail left by the galloping dogs. I felt certain Jim was at grips with a grizzly.

'It might have been three minutes, but it seemed hours before I broke cover and came out almost on top of a huge grizzly. Jim was nowhere to be seen, but Hunting Bob and his mate were tackling the monster. I had only my usual rifle, so, as Jim was in no danger, I stepped off; but the grizzly, evidently considering me worth chasing, brushed the yapping dogs aside, and swinging his great arms like a wind-mill, charged down upon me. I stepped back suddenly, caught my snow-shoe in a root, and went down. Before I could recover my footing the grizzly was close upon me, and I only just recovered my gun in time.

'I blazed away, retreating backwards step by step. I might just as well have poured peas into the grizzly for any use the gun was to me. It was only the charging, yapping dogs that prevented him from simply finishing me. But every few steps he would turn to brush them off as they sprang at his flanks. The going was none too easy, and I could not pick my steps, and every minute the grizzly might shake off the dogs for good, and, charging down, completely wipe me out. I could not help thinking that it was a marvel that he had not done this before.

'All the time he was grunting and growling savagely, whirling his great paws about in a boxing attitude, swiping now at one dog, then at the other, and all the time advancing upon me. As to the dogs, they looked sorry enough objects with their hides ripped and scratched, where the beast's claws had touched them, but they hung on to the attack pluckily enough.

'Suddenly I was brought up against a mass of snow-covered bushes, and stumbled backwards into a deep drift. I thought all was up with me, for the roaring grizzly gaped and boxed hideously not six feet away. He made frantic lurches in a mad endeavour to lay out the dogs, or seize me in a rough embrace. For one awful moment I tried to regain my feet. As the drift was crashing in under me, I heard another growl echoing from below. It felt as if I had landed on top of an earthquake. I squirmed madly to one side, catching sight, as I did so, of the blue ice blow-hole of a black bear close beside me.

III.

'Things were getting mixed with a vengeance. I tried to squeeze away under the bushes as a big bear humped up from his winter den. The grizzly tried to claw ineffectually at me, only succeeding in removing a good square foot of cloth, but fortunately not touching my flesh. I rolled still farther under the tangle of undergrowth as the black bear rushed out and went for the grizzly in a frantic rage at being disturbed. I did not wait to act as umpire, but burrowed away under the snow and bushes, leaving the bears to settle the fight as they liked. Two bears were more than the dogs could tackle, so Hunting Bob came whining after me, and his mate followed his example.

'Perhaps it was the dogs' retreat, or perhaps it was their usual cussedness, but those two bears ceased arguing and made after the dogs. I had no wish to renew the encounter with my peashooter of a gun, and burrowed for all I was worth farther into the bushes, hoping to get out on the other side, thus escaping from the bears. Suddenly the snow gave way, and I was precipitated down a steep bank. I wasn't hurt, but well scratched by the thorny bushes that grew on top of it. I sat up and looked around. The two bears craned their heads over the top and growled savagely.

'The brutes paced along the top of the bank for some time, but the snow-covered bushes that overhung the edge gave a little under their feet, and they were afraid to venture down. At last I heard them retreating, with muttered growlings, in opposite directions. I waited until all was quiet, and then scrambled up the bank and made off in the direction of the shack, thankful that I had escaped so easily.

'Then I remembered the hail. Jim had been in trouble. Where was he? I had been so occupied with my own affairs that I had forgotten him. I retraced my steps. It was getting late, and the sun was just on the edge of the tree-tops. I soon reached the scene of the conflict, and walked back to where the dogs had engaged the grizzly. The snow was so trampled that, in spite of a detailed examination, I could not make head or tail of the signs. Once I thought I had discovered the trail of a moccasin, but that was all.

'After a prolonged search I did find a lock of long, dank hair that had been scraped off a head in a lump, scalp and all. It comforted me some, for I knew it was Indian hair; besides, Jim was as yellow-haired as a Swede. Still the memory of the call haunted me. I looked still farther, but could see no sign of an Indian, so started off once more for the shack. Suddenly I heard a dog whimpering behind me, and turned around to find Hunting Bob, stiff and wounded, trying to crawl after me. I suppose his wounds had stiffened in the cold air. He crouched at my

feet, and whined piteously. I lifted him up, intending to carry him back to the shack, as he seemed all in. But he wriggled out of my arms, and tried to make me understand that he wanted something.

"What do you want?" I asked him, but he only lay and moaned at my feet. I was in a hurry and didn't want to linger. I was still haunted by that white man's hail, and I wanted to be sure that Jim was all right. In the distance a wolf howled in a suggestive way, and I fully expected the grizzly to return and continue the fray. I tried to lift the dog again, but he howled dismally, then crawled into a tunnel under some snow-laden bushes, and whined for me to follow. I didn't like the look of the place. It was dark and dismal under the trees; in that hole it was as black as night. I struck a match and looked into it. The flickering light fell upon the trail where something had dragged itself over the snow, leaving ominous stains behind.

'A faint moan answered my call. I didn't wait to think, but dived into the tunnel, creeping along, until I came to the prostrate form of an Indian. I knew it was an Indian by the feel of his naked body. He was as near unconscious as he could be, and had probably crawled under the bushes waiting for death to end his sufferings. I thought Hunting Bob must have found him, but I learnt afterwards that Hunting Bob and his mate's sudden appearance and assault upon the grizzly had given the Indian time to creep away from his foe. Then I had come up, and the grizzly had gone for me instead of staying to root the Indian out of his hiding-place.

'I was puzzled what to do. The Indian was almost dead, and would be frozen to death in a short time. I tried to lift him, but he was not only a bigger man, but as heavy as myself, and the restricted quarters prevented my getting a good grip upon his body. There was no help for it. I built a huge fire out beyond the bushes, and then dragged him out into its warmth. He revived a bit and opened his eyes, gazing stolidly into the fire as he lay in front of it. It was a weird scene—the wounded, silent Indian and myself crouching there, waiting for the moon to come up. I hoped by that time he would be able to crawl, with my help, down to the shack. But at daybreak we were still there, and the Indian was still too stiff even to stand. I built a huge fire in front of him, dressed his wounds as well as I could, and left him there with Hunting Bob and his mate to keep him company, while I went back to the shack to find Jim.

'I found him in an awful state of mind. He'd been out hunting for me until late at night, and was just about starting out again when I turned up. To cut a long story short, we got the Indian down to his *tepee* and left him there, and by this time I'd found out that it

was Minosi I'd rescued. We left him, as we thought, to die, but in a feeble voice he assured me he would always be grateful, and that he intended living to kill the grizzly that had mauled him.

'We went back to our trapping, and almost forgot all about Minosi, except to wonder whether the old brave had recovered. I thought he'd died, for about three weeks after we'd taken him to his *tepee*, Hunting Bob and his mate came back to the shack, both looking decidedly the worse for wear, but getting all right again in a very short time.

IV.

'When the summer came we sold out our furs, and went prospecting up north for gold. We hadn't any luck, but hung on as long as our supplies lasted. Then we decided to return to our trapping-ground of the winter before. Jim was for following the old trail back, but I wanted to try a new and supposed shorter one. So we parted, each promising to turn up at the shack before the first snow fell. I watched him go off, and lingered to shoot some caribou. Then, having luck with them, I decided to stop and prospect a little longer. I'd plenty of time before me, and I'd been told that the new trail was miles shorter than the other, and was reported to be well marked.

'I grilled caribou steaks and ate them, watching the whirling red leaves, and listening to the honking of the migrating wild geese. Hunting Bob grew uneasy, and followed me as I chipped off chunks of rock and examined them for gold. He whined and whimpered, running down the trail as if urging me to follow, but I was too interested in my prospecting to leave, especially as I'd found a place that was showing promising signs of colour.

'The air was keen, but there was no sign of a break in the weather when I rolled myself in my robes in the evening, but when I awoke in the morning the snow was falling silently from a dull gray sky. Not a sound broke the silence of the white world around me. Hunting Bob whined miserably, and would not rest until he saw me load up the hand-sleigh. There was not a breath of wind to pack the light feathery masses of the snow, and the going was terribly hard. I ploughed steadily on until the early night set in, and it was still snowing in that silent, relentless way.

'The next day I resumed my journey. I plodded on, Hunting Bob running beside me as solemn and serious as an Indian. He knew what lay in front of me; I didn't. There was no sign of life beyond our three selves—even the wolves had fled before the snow. My store of meat grew less, until I dared not eat more than a mouthful at a time, and each day's journey grew shorter as my strength gave out. At last, dead beat, and almost starved, I cowered

in a hollow under a bluff. It was impossible to fight any longer against the snow.

'There was plenty of wood at the edge of the trail under the snow, and the hollow was sheltered and comparatively free from the white covering. I built a huge fire, and crouched down in its warmth, too miserable to do more than gaze at the mounting flames. Hunting Bob sat beside me, uneasy and restless. Every now and then he whined as if worried. His mate burrowed under the snow, catching the mice that lived among the dead leaves close to the earth.

'Hunting Bob grew more and more uneasy, and I wondered what was the matter. Suddenly a surging moan swept through the pine trees. Louder and louder it grew until the blizzard broke in all its force, catching up the loose, powdery snow and flinging it in dense clouds in front as it tore ruthlessly through the pines. The crashing and rending among the trees was terrific, but I hailed it with joy. The surface of the snow would be packed firm and the travelling would be easier. I should be able to make good time in my going. Then the awful thought came like a knell upon my hopes. My meat was quite gone, and if the blizzard lasted more than a few hours I should be too weak to move. Feeling utterly all in, I lay down and slept.

'It seemed to me that the blizzard raged continuously. I lay in front of the fire and chewed a piece of moose hide in a wild endeavour to still the awful gnawing of hunger. I slept fitfully, waking to grim reality after vivid dreams of plenty. The blizzard still raged, and night and day had hardly any significance to me. As long as I could I crawled out and collected wood, but at last that was beyond me, and I lay still. I could do nothing more, and Hunting Bob had left me, though I could not say just when he had gone. The end had come. The blizzard had passed, but it was too late. I was too feeble to move. I could hear faint, haunting sounds. But I was past feeling pain or hunger.

'It appeared to me that I was haunted by weird fancies. I dreamt that an Indian strode out from the early morning haze and, seizing the line of my hand-sleigh, drew me after him down the trail. I heard the barking of Hunting Bob, felt the warmth of fire. The dream was extremely vivid. My body was dead. Only my brain lived and dreamt. Still, throughout that extraordinary jumble of dreaming there came no food, until one evening I heard, as still in a dream, an Indian grunt of satisfaction. There was the rending of skin, and something soft and bleeding was thrust between my cracked and stiffened lips. Unconsciously I ate mouthful after mouthful—and woke to the realisation that my dreams were true, and to see the Indian greedily devouring part of a jack-rabbit.

v.

'Later on I heard the story of how Minosi had been wandering too far afield after a grizzly, and had been caught by the soft snow. He and his family were starving, as all the animals had been driven south by the snow. Hunting Bob had come whimpering to him for help, and because I had stayed with him when mauled by a grizzly, he had turned aside to help me. He had tasted no food for some time himself, until Hunting Bob had caught the belated jack-rabbit and brought it to him. For all he knew, his family might be dying somewhere along the trail; still he had turned back to rescue me.

'A jack-rabbit wasn't much between two starving men, but it put new life into us. Minosi gathered wood and built a roaring fire, and we warmed ourselves, and hope sprang again. As to Hunting Bob, he appeared to understand, for he arrived a few hours afterwards with another jack-rabbit, and seemed to grin with joy as we devoured it. The packing of the snow must have brought back the animals, for jack-rabbits were to be seen here and there at intervals, and we managed to secure enough to keep life in our bodies, although not sufficient to satisfy our hunger.

'I was hardly able to walk from weakness, but Minosi contrived to cover a little of the trail each day, drawing me in the hand-sleigh. Hunting Bob spent his time hunting. Morning, noon, and night we could hear his yap as he chased his prey. One morning, just at day-break, he gave tongue loudly.

"Bear," muttered Minosi, rising shakily to his feet, and reaching out for his rifle, that lay beside him. A fierce joy shone in his sombre eyes. A supply of bear meat would save us, and be sufficient to enable us to make the trail back to our shack.

"We're too weak," I muttered, as I shook my head. I staggered to my feet as Minosi, like a red shadow, vanished through the trees. Hunting Bob's yapping was getting fast and furious now. I crawled forward, clinging desperately to anything that would support me.

'I soon reached the place. A huge grizzly was sitting on his hunkers, flopping his fore-paws about in a wild endeavour to catch Hunting Bob, who danced yappingly around him. Minosi was crawling stealthily through the bushes, intent on getting a close shot at the brute. Suddenly he sprang to his feet, and, with a torrent of abuse, fired at the grizzly's ear. The great brute gave a blood-curdling yell, lurched forward, and fell.

'It was a weird scene: the long, lean form of Minosi standing there, silhouetted against the white snow; the great gray, almost dirty white mass of fur; and the dancing dervish of a hunting dog that snarled, growled, and fought

the dead thing. Then, catching sight of me, the dog dashed to my side, and grinned his delight at the plenty that lay in front of us. We were far too weak to take the bear meat to our fire, and too fearful of other marauders to leave it lying there, so we made a fire on the spot, and feasted at our leisure. Grizzly ain't quite the sort of meat one would hanker after at most times, but I guess no food tasted sweeter than that grizzly meat. I ate until I couldn't eat any more; Hunting Bob did the same; then we rolled over in front of the fire, leaving Minosi still busy feasting. When I awoke in the morning he was still at it, though now his eyes wore a far-away look in them, and he murmured a sort of song of his prowess in killing the grizzly. He evidently believed it was the one that had mauled him. So droning out his triumph song and eating he passed the day, while I and Bob alternately feasted and slept.

'The next day Minosi rolled up half of what remained of the grizzly's meat in the skin, and throwing the bundle over his shoulders, vanished down the trail. A little later Bob and I, with our share of the grizzly meat, were on our way back to the shack.'

SOMETIMES I THINK.

SOMETIMES I think a child-like trust
A greater thing by far
Than all the world's assessment just,
That knows men as they are.

Sometimes I think a woman's touch
Some hidden depths may reach,
And tune some broken chord in such
A way no words can teach.

Sometimes I think a lover sees
(They say that love is blind)
Some virtues fair, pure hopes to please,
That we can never find.

Sometimes I think a sinner knows
A sympathy more deep
And understanding more than those
Who virtue's pathway keep.

Sometimes I think beneath life's pain
There hides some purpose pure,
And sorrow's cross is manhood's gain
To make the pathway sure.

Sometimes I think that life is gift
To soul to make or mar,
Itself to lose or greater lift
Towards some distant star.

Sometimes I think could man keep troth
Unstained with his own soul
He would attain in perfect growth
The uplift of the whole.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

SHAKESPEARE is being tolerated again in the West End of London during this winter season. It is important that this circumstance should be recorded, lest posterity might assume that at the challenge London failed to hold herself in line with some European cities and places like New York, Chicago, and San Francisco, which, though claiming no possession of the immortal in any material and birthplace sense, raise certain pretensions in the spiritual line. Thus we remember that the Germans, who had the audacity to play Shakespeare in Berlin at the white-heat of the war, and found him to succeed marvellously at a time when London would not look at him—save for a momentary peep at *Henry the Fifth* for the sake of the war spirit and the martial speeches—those Germans, who are both good and bad at so many things, set up a claim to Shakespeare, bearing they had spiritual rights in him, from which it appeared they were prepared on challenge to proceed farther. Unsatisfied with torn treaties and the perpetration of all crimes, outrages, and sins, they would steal our poet, paramount genius of all the ages, chief of those upon whom we depend in a measure for prestige in intellect and culture. People of other nations may think us sometimes vulgar and possessed of simple and unsophisticated minds, as witness the case that we pay our national debt right down on the nail, even though we should walk in sackcloth and our creditors be weighted down with overloaded riches; but the truth is not to be escaped that we people, poor and proud, do own Shakespeare, for he was born in Warwickshire, and if we treat him carelessly, leave him hidden and neglected in the cupboard, after all that may be our own affair. Under compulsion, however, we should assert our rights, for if we played no Shakespeare, reduced him not, neglected him, and regarded his plays, when acted, with something like disdain, we might seem to waive our title, as when people never walk along one of those footpaths through the fields that are somehow mixed up mysteriously with public rights they may find a fence erected and their privileges passed for ever. Thus it might appear to some in foreign places that London has

been peculiarly impelled by outside influences to producing Shakespearian plays this season, though the producers may have been indifferent to the foreign vogue. The pleasant truth is that at the present time there is evidently what we might call a strong revivalist movement in progress on the London stage, and amid a sodden mass of post-war features of life, action, and tendency that are disquieting and discouraging, this is found by many who gaze anxiously for a light upon the horizon to be a hopeful sign. For in all ages the theatre has been a great reflector of the minds and consciences of people; it has held the mirror to their inner thoughts, and this season's strongly marked disposition to do better artistically and intellectually with the stage than for a long time past marks a resurgence of our better selves, and points it with a promise. When Mars and Venus were going out together on nights in London a few years back, revue at its silliest, most stupid heights was what served best their distracted minds, and this kind of entertainment fare belongs to the alcohol and nicotine group of habits, which when once contracted in excess are peculiarly difficult to discard. Revue fell away a year or two ago, but seemed to leave a blank behind it, the London stage being then dull, unoriginal, colourless, vapid, and discreditable to the people of the capital of the British Empire. Bottom was touched.

* * *

This year England is setting up some kind of an intellectual resistance, of which this is one evidence, or, at least, we like to regard it so. The fact is unmistakable. The considerable success of certain revivals of pre-war achievements seems to have prepared the way and provided the necessary stimulus. There have been more of them this season—several plays by Sir James Barrie have been running simultaneously—but along with them some splendid productions of fine new work of various character. There is *Hassan*, the poetic play of the late James Elroy Flecker, at His Majesty's Theatre, which takes a place in the history of theatrical production. The many new plays have been of full average merit. I care less for London than once I did; the splendid days and nights of twenty years ago will never

return. The social circle is too wide, irregular, with jaggy holes in it; club life as we knew it is extinct, and all is confusion and rattle; but yet London now is in many ways exhilarating, and never more so than in the winter. For entertainments—apart from opera—such as we have spoken of, she seems, from programmes, to be definitely better than Paris or New York. Had this comprehensive offering included no Shakespeare the omission would have been sadder, more noticeable than before, but the case is that Shakespeare has been somewhat more conspicuous in the general arrangement than for many years. And all the time there is, of course, the Old Vic., which is now its own adopted name, the most famous and distinguished, most worthy Old Vic. It is in a slum street down on the south side of the river by the Waterloo Road, and is approached by an avenue of fried-fish and stewed-eel shops, whelk and coffee stalls, and through a press of people that is as likely to contain cut-throats and burglars as any other, in which no gentleman, not a lover of Shakespeare and honest art, would care ever to be seen. But this true and simple theatre, strong in its determination, sincere in aim, and magnificent in achievement, is now often, and rightly, called the 'chief theatre of London' and 'the national theatre,' and for myself I know that in some foreign places it is almost the only British theatre the people have ever heard of. Lately I found the chief newspapers of Madrid with long articles in series about it; in Rome folk have asked me to tell them of the Old Vic.; and a French officer of a literary and theatrical turn of mind, at a lonely military station in southern Tunisia, when talking to me one night under the starlit desert sky of things he would like to see London for, mentioned this rare establishment. It has staged several more plays of Shakespeare this season; it has produced the horrible, the bloody *Titus Andronicus*, which had not been done in London for sixty-six years, and caused, it is reported, five faintings on the first night; and when *Troilus and Cressida* was staged immediately afterwards, it established the unique and amazing record of having, since 1914, presented all the thirty-six plays that are contained in the First Folio, the tercentenary of whose publication was being celebrated. This, then, is a theatre, with no nonsense. It is the kind of place inside that might in careless minds be considered proper for a small provincial city. Here the play is the thing, and all besides is sympathetic simplicity. Benches are best for Shakespeare, and here we mostly sit on benches, and may smoke. There are no footlights; the bright illuminations are focussed to the stage from lights held above and in front. Such as read of the Waterloo Road need not fear that here within all is not clean and nice, with the true atmosphere pervading. I think that here

we might welcome the shade of Shakespeare less shamefacedly than at any other place in town. The people who attend know why they do so; Miss Lilian Baylis, the manageress, understands her business, the players theirs, and certainly the audience their own likewise. There is an Old Vic. society, or circle, which has meetings of its own and a magazine. Here you may have a seat for fourpence, or, being wild, may spend just ten times as much; while for me, paying one and tenpence, I watched from a fine place in the balcony what in all probability I shall never see again, what few mortals who pay constant homage to Shakespeare have ever seen—the doings of Ajax, Hector, Agamemnon, Ulysses, and the full kit of them in *Troilus and Cressida*.

* * *

Some evenings back I had the chance to discuss this question of Shakespeare and the fair recognition and appreciation of his work in England—it is dreadful, but necessary, to state the case like this—with Miss Sybil Thorndike herself at the back of the New Theatre just before her playing in *The Lie*, the new play by Mr Henry Arthur Jones. She had then returned from Manchester, where she had received the honorary degree of Doctor of Laws from the University in recognition of 'a devotion to her profession which had had a profound influence upon national art.' Manchester shared with the Old Vic. the most important parts in that artistic development that has led to her taking the highest place among British actresses, and to having properly assumed that position of supreme stage artist, occupied by only one or two in a generation, as to which the vacancy was beginning to be acutely and disconsolately felt. For all Sarah's age and rare appearances, Paris feels a wider vacancy since Bernhardt passed away than she would if a good half-dozen of her very best politicians were, for their country's good, to retire themselves to monasteries; Mussolini knows what Eleonora Duse means to Italy, and was careful that as soon as his Fascists had settled down in Rome for the rule of Italy he should seek a conversation with her upon the theatre and art and how they might be encouraged, and see that some of the terms of this important talk were published in the papers. Maria Guerrero in Spain for more than a generation has been a commanding figure, and recently, when the nation determined to honour her, there were scenes of enthusiasm in the streets and elsewhere which, for ebullitions of sincerity by the populace, are not equalled when kings and queens pass in procession. There is that degree in achievement when such figures as these advance from the point when they are considered as fine and famous (and there is always through the inevitable circumstances of extreme publicity a vastly exaggerated estimate of stage

'greatness'), but largely in their selfish interests, to that when, no matter how personal interests may be served, they are national possessions; to this degree Miss Thorndike has arrived, the more worthily and honourably because of her proven sincerity and sacrifice for her art. She performed the miracle more than a year ago of drawing London and the country in long tailing crowds to her theatre to witness her performance, with a minimum of stage accessory, of an old Greek tragedy, Euripides' *Medea*. At the beginning of this season she produced *Cymbeline*, often referred to as one of Shakespeare's 'unproducible' half-dozen. Teeming with thoughts and ideas and beautiful lines, and having Imogen, one of the most delightful of Shakespeare's women, for heroine, it is not considered to be a good play for the stage. Miss Thorndike plans new risks and adventures continually, and brings to their performance the tragic power of a very highly gifted artist. But it was for her knowledge, her divination and sincerity, rather than her celebrity, that I needed a word with her for the purpose of this theme. There is a conspiracy of circumstance to provoke thoughts upon it at this moment. The Old Vic., rejoicing in the gift of a great benefactor, is saved and doing well, and is better appreciated than ever before; Mr Donald Calthrop has established a real Shakespeare season, with a repertory beginning with *Twelfth Night*, at the Kingsway Theatre; and at the beginning of this winter there was that tercentenary of the publication of the First Folio to be celebrated somehow. I am made aware that by some curious process of coincidence Shakespeare this winter is being more extensively played abroad than ever before. In New York, thanks largely to certain actors who have stood as closely to Shakespearian tradition as they could, there has for long been keen appreciation and regular production of his best works. Managers in London say that even to play *Hamlet* here is asking for trouble and bankruptcy, but not so there. In Berlin, of course, they play Shakespeare always. They did so through the war, and they appreciate him better now than ever. Madrid, though its stage is peculiarly enterprising, with great limitations set upon it, and is appreciative of foreign classics, especially the French, has somehow evaded Shakespeare. The cultivated Spaniards, with their devotion to Calderon and their other brilliant dramatists of the past, have had difficulty in discovering anything at all of the spirit of our poet, and even in knowing the matchless beauty of his work, which never can be known in mere translation, while the metre is so different from that of their own short-lined classics; but their foremost living playwright, Jacinto Benavente, he who received the Nobel Prize last year, and whose writing is among the very finest of the new dramatic work of the world, told me one night at the Teatro Español

in Madrid of the devoted study he had made of Shakespeare's work, of his admiration for it, and its influence upon him. That influence is perceived in such a brilliant piece of work as *Los intereses creados*. Ricardo Calvo, the foremost actor of the Spanish classics in Spain, who appears by regular custom and appointment at the Español during the season, told me once that he had played Hamlet in the Spanish provinces and Romeo in Barcelona, and liked the parts, but none else has done so. Margarita Xirgu, the tragedienne who will succeed Guerrero, and who is a really brilliant actress, confided that one of her ambitions is to play Lady Macbeth. And now, this very season, another eminent Spanish actor, Moreno, has played Shylock in a freely adapted version of the *Merchant of Venice*. But the case of Vienna is the most remarkable. Soon as the summer faded the wonderful Viennese, who deserve heavenly recognition for practice of the culture and refinement that fill their soul, amid all manner of difficulties and disasters set themselves to enjoyment of the best in music and the stage. At the Burgtheater, which is national, and one of the biggest and finest in the world, *Richard III.* was produced, and became an instant and amazing success. Shakespeare was here always the strongest 'pull,' but this occasion exceeded all. The theatre was booked to its limit for many nights in advance, and at each performance four thousand people sat in intensest silence spellbound. The play was given without any musical intervals, and, though there was fine scenery, the impressive pictures, as we are told, were mainly the result of lighting effects and grouping and arrangement of colours, backcloths, and such like major accessories.

* * *

Pity that in a season such as this we could not have been enjoying a great *Hamlet* in London, and so demonstrated our superior attributes, for only a British player can make a real *Hamlet*, however others may have read the part. It has been said that we shall never again in our time have a long *Hamlet* run in London, and that is sad if it is so. Yet why should it be? The last must have been that of Sir Johnston Forbes Robertson, already passing to rich, mellow memory, one of the most splendid works of art prepared upon our stage. This was the 'gentlemanly' *Hamlet*; the prince was the fine, noble spirit, the quintessence of delicacy and refinement. We have seen many *Hamlets*, that of Sarah Bernhardt of the golden voice among them, and it is only when the fourth or fifth presentation has been witnessed, and the subject thought upon again a score of times, that, as with the Wagnerian operas, the inner majesty and greatness of this art comes to be fairly realised. It is impossible to know anything of Shakespeare until a free and intimate familiarity with his work is established, and Heaven be thanked

that he cannot be taken with a nod in passing. That is one point of the value of the work that is being done by the Old Vic. in the Waterloo Road. Hamlets will come from there, perhaps. Somewhere in Sicily, in the middle of last winter, Sir Johnston Forbes Robertson and myself happened to be staying at the same place for a time, and, he resting like this, and taking no more interest in the theatre as it seemed, I asked him if it were final that he would never play again, and he answered decisively that it was, and that he would look with dread upon the possibility of a return to theatrical work. He was strenuous; he may be older than, with keen and handsome presence, he seems. So thence there is no more Hamlet. Well, that career was bravely and magnificently made. He was telling me in Sicily of some of the beginnings of it, and the middles, and the end. He would have been an artist, a painter of pictures—always, instead of for pastime, as happened—had he had his choice in life, and was studying at the Royal Academy, but, one of a large family, he had to think of ways and means and futures, accepted an offer to play a part at a theatre, and the die was cast. Long after, Ellen Terry encouraged him to embark upon Shakespearian production on his own account, when in creditable timidity he had hesitated upon the ground of competence. A wonderful worker and perfect artist, his capacity was such, as he told me, that even after all the excitements and strains of a first night, as well as all other nights, he could go home and be asleep within the hour. But the strangest thing, in view of the great success he achieved, was the fact that in the fullest and completest sense he was never really in love with his work. Shakespeare, indeed, he loved, the beauty of the words and thoughts, the marvellous character and construction, but he hated all the mechanism and organisation and all the business botherations of the theatre. Had it been just a matter of reading Shakespeare and playing him, it would have been different.

* * *

I was thinking of these things and of all the futile talk, and nought but talk, about a National Shakespeare Theatre, and of the truth, as I knew it in my youth, of the better education in acted Shakespeare of even the common people, as we call them, in the provinces than in London, due largely to the splendid educative work of Edmund and Osmond Tearle with their touring companies in the past, and Sir Frank Benson later, and of many other things, when, for a few minutes in her room in the theatre, I persuaded Miss Sybil Thorndike to discuss them with me. To her conversation she brings the sincerity she practises in her art, and speaks no optimistic nonsense. Just the truth. And when I had wondered beforehand if, supposing things went well

in talk, I should speculatively suggest that modern Britain is unworthy of the poet, that it knows little of him, and may, perhaps, care so little, and that it would keep him permanently on the shelf next to the Bible, she out with it in advance, saying in effect that that was true, and more. 'We are not a theatre people,' she was saying to me. 'We may be musical, but decidedly our people are not for the theatre. They may have been once, but they have changed. People's dispositions have undergone a transformation with time, and we no longer are like the Elizabethans, or have much in common with them. Poetic plays are not wanted now, and we cannot be considered a great poetry-loving nation. The Continent indeed! It is not, after all, a matter of surprise, even if it is the cause of some inward humiliation, that we are not a theatre people as the continentals are. My husband [Mr Lewis Casson] has himself just returned from Vienna, and he tells me that there they are playing three Shakespearian plays—*As You Like It*, *Twelfth Night*, and, I think, *Hamlet* is the third—all the time, and simultaneously elsewhere they are running a play of Bernard Shaw's and a full season of Wagnerian opera! That is being a theatre people, devoted to the true art of the stage, conscious and sympathetic, sincere and appreciative. Those Vienna theatres are packed to overflowing all the time. But for ourselves it is different, and the truth, not understood, perhaps, fully by the general world outside, is that it is the rich people, combined with the high charges for admission that must be made as the result of the rents levied for theatres, who are to blame. To make Shakespeare pay in the West End of London and achieve long runs, such as are not only good in themselves but give spur to the ambition of other actors and actresses, the stalls, the high-priced places, must be filled, and, as things are, they cannot be or are not filled. The rich people do not come to Shakespeare. Oh, if I had my way!'—and Miss Thorndike was ecstatic at the thought of it—'all the bottom of the theatre should be seats for which nothing more than five shillings should be charged. That would be grand, and in its manner it would be successful. It would give Shakespeare to those who wished it most. But for the present it cannot be. Perhaps, through fortune or misfortune, there may come other changes in the national temperament and disposition, but the tendencies in that direction are not to be discerned at present. The films are having a great influence now. By some it has been suggested that if Shakespearian plays were made great colourful spectacles again they might succeed better. We remember the success of some of the early ones at His Majesty's Theatre with Sir Herbert Tree at one time—those remarkable shows. But I certainly do not think they would succeed again, because the people do not want

stage shows and the doctored Shakespeare in the same way that once they did. They tired them; even under Tree they did not succeed in the end. And in our present time the great stage show, whether Shakespeare or otherwise, does not capture the public fancy to nearly the extent that some imagine. In the matter of things of this kind—well, there was *Chu Chin Chow*, but there has been little besides that has paid. After all, that is better; and if Shakespeare is acted now, it must be done with becoming respect and modesty, and a reasonable and not exaggerated plainness. There are some plays like, say, *Twelfth Night*, that under fair conditions may achieve a measure of success at any time, but with others it must always be a great adventure. Our only national theatre, our Shakespeare theatre, is the splendid Old Theatre. It is paying now for the first time, and

I think it is the only national theatre that ever will. On the other hand, it might be said that our real national theatre, the theatre that the people want, where they see that which they most wish to see, and always will, is the Coliseum. The music-halls are the national theatres of Britain; we are a music-hall people. But do not imagine I say this in disparagement. The entertainments provided at these places are often extraordinarily good, and the comedians are marvellously clever. They have studied their art, worked at it, and brought it to a high state of perfection. I will tell you—I go to watch them, to study them, and learn from them. I have learned much from what I have seen on the stage of the music-halls. When I have the opportunity I love to go there. . . . But, of course, it is not Shakespeare.' And that is or may be the end of it for the time being.

THE ADMIRAL'S SHORE DAYS.

CHAPTER III.—continued.

II.

SHE came next afternoon.

Joyce was forth from the carriage, and had time to aid her descend, before I could reach her from the hall door. She was wearing a white bonnet of violet gauze, through which I could see her bronze hair. The bonnet was edged with gray, and, beyond the edge, the end of bronze curls which was nearer to me gleamed from the sun as she bent her head in stepping from the carriage. She had a slip of violet cloak and a violet skirt, both edged with gray.

She was standing beside Joyce when I came to her, her face very pale—I noted with some anxiety; her lips giving me a smile, but, of course, she had heard me; her dear, gray-blue eyes looking no different, no more different, from hitherto, as she had looked.

I took her on my arm up the steps, through the hall, and on up towards the library, where, for some reason, she and Joyce and Cecil liked to drink their tea than in the drawing-room. And as I walked so with her, looking at her, whilst she asked me of my second-deck stateroom, which she knew were the principal matter I had sent me to Portsmouth, I believed I saw, besides paleness, unhappiness, three-parts in her face. Moreover, I could detect she was quivering a thought.

When I had brought her over the library threshold I glanced at Joyce and Cecil, who were following us. 'I wish a private word with Miss Thayer, my dears,' I said; 'if she will very kindly grant it. Will you have that great kindness, ma'am?'

'Yes, my lord,' said she, but with a most plain quiver of her arm within mine.

I pressed that arm very tight against me as Joyce shut the door, giving us the room to our two selves, and came to a standstill with her. 'Child,' I said, 'you are all trembling—all distressed, I believe. Has it come to weigh very hard, your darkness that you faced so wondrous bravely?'

She looked at me, as it were, striving to smile, but with misery on her lips, with plainest misery in her face. 'Very hard,' she whispered.

I turned more to her, letting her arm within mine slip a little that I might not drag it, and placed a hand on the contour of her arm which was beneath her cloak, held the arm gently. 'Shall I seem cruel if I speak of happiness—of happiness for myself, when you are so unhappy?' I asked. 'I mean—Mary—if you—would be my wife, you would change my life to such happiness as I never thought it could change to till I saw you. Will you wed me, Mary, before I put to sea? And let me be able to think, all the while I'm at sea, of coming home to you?'

I had expected a flooding of pink to her cheeks and forehead, and surprise, well-nigh amazement, in her face. I saw that sweet, slender face between its bronze puffs only look whiter, only look more piteous—with no surprise in it. It moved, giving me a silent answer—No.

I slowly took my fingers from her arm; let my hand hang beside me. 'I ask pardon for that hand, dear ma'am,' I said. 'I love you; and I forgot in this moment that there was but—the very smallest chance you could love me.'

She lifted back her head, with something of denial in the gesture. Her lips were trembling; a flickering beat was very visible by each of her nostrils. She tried to master her lips—and tears were sprung up in her eyes! 'I will tell you,' she said whisperingly, said thickly from stress; 'I love you. I will not wed you. But I love you—better than life and sight, better—'

She gave a sharp, dismayed breath, for I had taken her right in my arms—would have drawn her right to me. But she set her little hands one below each of my epaulettes—for in her honour, as always, I wore a uniform coat in place of my old brown shore coat—and so she stayed me—because indeed I would not use strength to her, seeing her great unwillingness. With all my power, though, I pleaded, 'Kiss me, child! Kiss me, Mary!'

But, 'No, no!' she pleaded in return, her eyes, which could not see me, beseeching me, her slim shoulders beneath my forearm moving desperately troubled. 'No!' she entreated. 'I am not—betrothed to you. Oh no! No!' Piteously her shoulders worked and quivered and her hands pressed at me, and more or less I yielded to her. I took my arms from her, but my hands pressed lingeringly along her cloak-covered arms as she went back from me, and at the edge of the cloak I gained possession of her hands—held them; one in a crumple of silk glove which my fingers had slipped part-way down it.

'My dear one,' I said, fighting against my bewilderment, 'you love me—yet you will not wed me? Why? Why?'

'Because—my lord——' she drew a breath, tried to whisper on, failed, with the tears brimming from her eyes.

I looked down, or I must have kissed her—looked down at the little, half-bared, white hand in my rough, scarred hand, and moved my thumb in caress upon the whiteness. "'My lord,'" I said in echo of her broken words. 'Nay—"Ben." At least, "Ben," since you love me.'

'Ben,' she whispered; 'Ben—Ben!'

Midway her fingers had twitched, tightened on my hands, and she ended with a choke. And, looking up, I saw that the tears were away down her cheeks now, big, fast-running tears.

She did not seek to lift a hand to them, but held my hands still more tightly, bowing her head forward. She felt a tear fall on her wrist, and at that held her head sideways, showing me her face shut-eyed, with tears running across into her dear bronze curls. A sob shook her suddenly—racked her through and through. She bent her head forward again until I saw only her pretty gauze bonnet and her hair; sobbed, and clung harder to my hands from knowing I was very, very near to whipping her into my arms and not heeding her any protest.

She strained and strained against her sobs, soon, in her effort, kneading stiffly at my hands with her fingers. Then: 'I meant not to come,' she whispered. 'But I knew you would—would come to me at the school—knew this must be!'

'What!' I said—and I forced myself to sound a light note, hoping this would aid us. 'What! You'd found out? You'd found out that the old seaman was stumping after you?'

'Found out!' She suddenly lifted our hands, kissed mine—kissed them again, with a kiss that was a sob. Then she drew those hands of mine against her young breast. 'Found out! 'Twas easy to find out. And what did I—care for blindness—since you would take me blind! And then, when you were at Portsmouth, Mrs McCourt—by a chance—told me!'

'Mrs McCourt!' I said in astoundment. 'Mrs McCourt told you what?'

'Of—of your—of Joyce and Cecil's mother, who'—she took a long, shaking breath—'who prayed you marry some—some one that would—watch and guard them. *Watch! Guard!*' Her head went lower. 'How I have suffered!' she whispered. 'How I am suffering now! Let Joyce take me home!'

'I wish that silly old McCourt,' I began savagely. Then, dismissing Mrs McCourt, I put my cheek to the soft violet gauze which covered the bronze hair, yet scarcely amounted to a covering—let my cheek rest there, while her head drooped a shade more till the forehead touched my coat. 'All is right, my beloved,' I said. "'Tis a little strange—how things have fallen, yet nothing beyond that—nothing! You thought that because Janey, their mother, spoke those words, you ought not to wed me?'

'I *knew* I must not!' She drew another long, quivering breath, her breast pressing my hands, her brow heavier against me. 'It'—she strove against a sob—'it would have been—cruel mockery of her! I—*blind! helpless!* A mocking sin! I *knew*. I decided—utterly. But I am suffering so! Let Joyce take me home!'

'Nay, nay,' I said. 'Listen, my love, listen. I gave no word to Janey that I would marry a wife who'd watch them, and she was content to leave the means of guarding to me. There, child! And listen. When I am at sea, and you—my wife—are here at Bagenal, Joyce and Cecil shall go to school as now, if you wish; and you shall have two young governesses in the house for guarding them out of school time. And this will make bright company for you, eh? There, child, *say all is right*. Say you will wed me.'

I felt her head move for 'No.' I felt her strain afresh with a sob, felt the cruel force of the sob when it broke from her, with other sobs after it; and as I tried to hush her sobs with words, I had the hardest struggle with

myself I had ever known to keep my arms round her. Presently came whispers from her.

'I will not. I should still be—mockery of—what she had wished. Even worse—I should end in—in the road of—a wife who could part them!'

'There shall be no wife but you,' I said.

'Yes—for their sake—when they are too new for governesses. They will need her.'

'They will not have her. Do you think, my beloved, that any wife could hold them? No! We must find other means—dear one; for you are going to wed me.'

She lifted her head. I knew it was not assent, and at the first motion I raised my hand because I would not be mean enough to let her lips touch my cheek, which, in her weakness and woe, might well have happened. Her head went a long way back, displaying to her dear face with all its wrack of tears, to her bronze curls a darker bronze where they were against her face because of the wet tears. I thought she swayed a point; so I drew one of my hands from hers and laid it gently, flat-palmed, between her shoulders to steady her. She put a hand, as though to shield herself, upon my coat. After an instant she lifted her other hand, holding mine, to her cheek; and the rough backs of my fingers felt those tears, felt her wet cheeks—with small consciousness of her action, I think—she pressed our fingers against them.

'I decided—utterly,' she whispered very restlessly—very brokenly. Then, pressing my fingers more against the curls, she steadied her whisper. 'I would not dare wed you. Think! if I wedded you, being helpless to bid Joyce and Cecil, knowing I was helpless to do something befell them because I did not bid them! Think—of them, and of that on your soul! I have thought of it every hour since Mrs McCourt told me—every hour in my life. I dare not, could not, face it. Ben—do not love me; you would not have me face it.'

She gave a quick, sighing sob, and moved her fingers and the curls beneath them a little to press up her cheek, leaning heavily against my palm. 'Do not think me all selfish,' she said—'heedful for myself, not heeding you. I shall break my heart for want of you—not that I believe. But that is better than—mockery of—' She gave another quick sob—another, the reddened lids of her dear eyes peaking in anguish as she seemed to look at me—anguish that stabbed me through. 'I—cannot—endure!' she whispered, moaning. 'Let Joyce take me home!'

How could I hold against her appeal longer? I slipped my hand down to her waist, and began to lead her slowly, she still holding my fingers to her curls.

'I have been cruel, my angel,' I said. 'I will go for Joyce. You shall sit in your chair—your favourite chair—for a moment till she comes. Ben will ask you no more to-day.'

'No more—ever,' she whispered. 'Oh-h, no more such minutes—as these!' For two measured steps I was silent, my fingers tightening about hers. I was viewing a wan light on a distant shore, wondering if it was all that was left to me to head for.

'In six or seven years, when they are wed, my beloved,' I said; 'then—'

'No!' she whispered swiftly. 'I vow not! Or you would stay unwed for me.' She drooped back her head farther, weakly, drawing my fingers on to her forehead—with a thick, moaning sob, pressing back her hair and the soft edge of her bonnet. 'I am—being killed,' she moaned.

'Nay, all is over, dear one,' I said. 'I will—never more speak of this, if you will it.'

I brought her to the arm-chair which she always sat in, moved it well away from the hearth for fear that now she might faint and fall near the fire, then let her sink from me into the chair, and stood for brief seconds while she held my hand.

She took it from her forehead, parted her fingers from it; and with a tiny, dull gesture held her palms to her face, set her arms on the chair arm.

I walked to the door and opened it, and looked down the corridor for Joyce. I saw her and Cecil standing at the end, Cecil holding a silver basket-dish of cakes for our tea. I signed to them; went to meet them; and coughed—knowing that my voice would not be as usual. 'Go to Miss Thayer,' I said to Joyce. 'She bids you take her home.'

'Home?' The child stared at me, her face changing very much as she saw something inexplicable in mine.

I nodded. 'You will find her crying—broken-hearted,' I said. 'I think I will tell you why, Joyce—Cecil. She and I love each other. She would have wed me, have come to this motherless house of ours, have made it the sweetest, gladdest place. But, with her eyes blind, she would not be able to tell if my daughters were preparing desperate mischief before her very face. And so she will not come here.'

I looked up at a picture of frigates in line ahead off Toulon, folding my lips very hard, for they had quavered as I finished speaking.

Then I felt Joyce's fingers on my arm, heard her say very tenderly, 'Father, dear!' Giving my eyes a blink, I looked down at her. I saw that her cheeks had lost colour; I saw them lose more, saw her eyes turn stricken, well-nigh aghast, as she gazed at my eyes. 'Father, dearest!' she breathed.

Then, with her fingers holding my arm

hard, she veered her face half-aside, stared up the corridor. A kind of sternness came suddenly to her young mouth, giving her—it crossed my mind—rather the look of a little midshipman in battle. And then, with no further word, she abandoned my arm, and sharply took Cecil by the wrist.

My Cecil's eyes and thoughts were on me. Joyce's grip and drag at her brought her tottering sideways, clutching at her silver dish. 'The cakes! you——' she began, with a little flash of teeth and temper. Joyce took the dish from her, shook her arm for silence, and led her up the corridor, and, whispering to her, into the library. And from there came to me Joyce's voice, low and pitying, 'Oh, ma'am! Oh, ma'am!'

I walked away to the end of the corridor—aware of blinking my eyes again—and swung open a window and whistled to Fred in the stableyard. 'Run the chariot out,' I said. He touched his cap.

I gazed over the park for a moment; then, ere he was gone from view, asked, 'Will your knee stand another ride to Portsmouth—starting to-morrow?'

'Ay, easy, my lord.' He turned on the red brick path to face me. 'Portsmouth again, my lord?'

'Yes,' I said, leaning on the sill. 'They'll pinch me in those guns if they can—fob those cheap orlop stanchions on me. I'd best be there.'

He nodded. He had ranked as prime seaman in his time, and been shipmate with me in the *St Lucia* fight of '82, his last year at sea.

'Ay, you'd as well be,' he said. 'I'll show you what I mean about that foremast-bed. You'll give me another pass to go aboard?'

'Ay, Fred; ay.'

He waited; then, since I did not speak again, went for the chariot. I stayed at the window while two, perhaps three, minutes passed. Then I heard a scurrying of light footsteps in the corridor behind me, and turned and saw Joyce close on me. Her face was very

flushed; her eyes were veritable star eyes, with tears edging them, and tears and bright tear-lines below them. She was smiling—gasping.

'She'll be my lady! She'll be my lady!' Joyce caught my hands, then drove an arm up round my neck; swung herself off her feet by that arm. 'She'll be my lady!' the child gasped, kissing my cheek.

'What! What are you saying?' I muttered, holding her tightly, carrying her a pace or so towards the library in the whirl of my thoughts, then pausing to let her find her feet.

'We have made a promise, Cecil and I. Do you think we would see you—nearly cry, and her— Oh, it all—her arm bore on my neck; swinging again for a second, she gave me another gasping kiss—'it all well-nigh broke my heart. I said to her—I was crying—I said, "Oh, ma'am, be my lady! be my lady! and I'll promise—promise never to do one little act that I think you will not like, ma'am, as long as ever I live. And I'll die before I break that promise!" And Cecil said, "Oh, my lady, be my lady!" Cecil was all mixed, with tears getting in her throat, but she knew well what she was promising. And I said—and it was truth—I said, to urge my la—, I said, "Oh, ma'am, we'd promise no one in the world but you with your poor, beautiful eyes and your sweet lovingness. So only you in all this world, ma'am," I said, "can keep Cecil and me heading fair!" And we promised—and she'll be my lady!'

Joyce stepped back from me; leaned panting against the oak side of the corridor, biting her lip and moving her hands this way and that in her delight. 'Cecil is there, holding her. You will not want Cecil,' she said after me as I made towards the library. 'Will you bid her come with me to fetch the rat-trap?'

'Rat-trap?' I asked, though truly with no interest in this.

'Out of Mrs McCourt's bed. 'Twas only weak-springed. I am honest, it would not have hurt her toes much.'

THE END.

AT A BOLSHEVIST PORT.

By O. B. E.

I.

A RAGGED mob, armed with rifles, lined the quay-side, staring hungrily at the *Gloriana* as she made fast. It was difficult to believe that, as we soon learned, these ghoulish-looking creatures were representatives of an army, the visible signs of Bolshevik law and authority, come to take possession of our ship, to search and examine us, to control the movements of every individual on board while we

lay in port. From these men of the Red Army we gained our first impression of emancipated Russia—this under-fed, consumptive rabble of jail-birds, as our mate called them. It was apologetically explained to us that they were conscripted from the rag-tag of Bolshevism: the poor fellows undergoing an open-air consumptive cure, and the malcontents who refused to work. This may explain why the armed men set over us day and night were changed every twelve hours; Bolshevism mistrusted the guard

as much as it suspected the guarded; hence a different set of men examined our passports and searched our clothing every time we went on shore or returned to our ship.

In the course of the day, after the sanitary authorities had had a good look at us, we were boarded by the customs, police, secret agents, import and export committee, comrades' committee, propaganda agents, and interpreters. They held a lengthy council over the ship's papers, casting sidelong glances at the whisky which the wily captain placed on the table before them. When they had satisfied themselves that everything was in order they proceeded to the living-quarters, leaving the whisky untouched. Lockers, officers' trunks, and seamen's bags were ransacked, and all letters, newspapers, books—every scrap of paper found in them—confiscated. Protests that these things were personal property were answered by a laconic '*Nitchevo!*' ('That's all right!'). 'Gawd, but they've rummy ideas about freedom and liberty, have these Bolshies!' exclaimed our romantic steward, when they annexed what we presumed was a bulky packet of love-letters addressed to him. He was naturally sullen when they demanded the keys of his storerooms, where they made a careful inventory of the contents. Practically everything movable we had on board was noted in various books, and at the end of the day, after they had ousted Sparks and sealed the wireless room, the numerous officials departed, leaving the armed guards in charge, and the untouched whisky on the captain's table.

In the course of the evening the majority of these officials returned, singly this time, on the plea that they had forgotten something or other. Our captain presumed they had come back for the whisky, and produced the bottle. To their credit, be it admitted that each in turn conceded the soundness of his (our captain's) judgment, explaining that they did not care to accept hospitality while the comrades were present. So, to make amends for the lost opportunity, they one and all filled the glass to the brim, quaffing it neat at a gulp. After the fourth full-glass visitor, and when the second bottle of whisky was getting perilously near the bottom in less than half-an-hour, our captain began to get alarmed, and passing the syphon to his fifth visitor, hinted that he might like some soda-water in it. 'Why spoil it?' his self-invited guest asked. 'A Russian throat wants to feel the bite, and your whisky is too weak to begin with!' Immediately he had gone, and before the arrival of number six, the steward was ordered to throw all tumblers overboard, and to serve whisky in future in nothing larger than the smallest liqueur glasses.

II.

On the day following our arrival, after our papers and seamen's books had been examined

ashore, representatives of the police and of the W.W.U.—World Workers' Union—distributed identity cards, our permits to pass the guard and go ashore. The W.W.U. man, a Russian Jew who had picked up a smattering of English in New York, fraternised with the deck-hands and firemen, all of whom he straightway made members of the club, inviting them to make use of it as though it were their own; which, indeed, it was, as he emphasised. Here they are treated to free drinks, free food, and free instruction in the new theories. On special occasions—such as the anniversary of a Red Army victory, which now takes the place of saints' days in the Russian calendar—all crews in port, regardless of nationality, are invited to a banquet at the comrades' club. At these there is unlimited feasting and drinking, while the big guns of Bolshevism boom loudly and defiantly. Money is an evil—a comrade declares—and possession a crime. In the new world of high ideals comrades are the capital, not millionaires' money-bags; the earth is their treasure-house, and the state their banker. A moneyed class is a curse—therefore it is the duty of every comrade to shoot millionaires at sight. There is no society except the society of comrades. All laws made by society are wrong, hence they are abolished.

A beginning was made with the antiquated marriage-tie, which bound two people for life, whether they liked it or not. You may still be officially united if you wish, free of charge. There is a Commissioner of Marriages for this purpose, who ties the knot so loosely that it can be undone within half-an-hour, also free of charge. No awkward questions are asked, nor are there any binding obligations on either side. You merely 'sign on' when you feel like it, and 'sign off' when you are tired, as the sailors interpret this new idea. Naturally they are interested in this subject—about the only phase of Bolshevism that makes any appeal to them, for they are informed that it applies to foreign sailors visiting as well as to Russians, and they recall the secret smiles of the fair ones they met on the way to the club, straightway planning to 'sign on for the duration.' Our donkeyman was the only member of the crew of the *Gloriana* who actually launched on the venture. He divorced his lawful wedded wife living in Sweden, married a Russian girl, deserted his ship, was taken before the Commissioner of Marriages the day we sailed, divorced again, and brought on board between armed policemen. It should be explained that this rascal had once lived in Russia, and had the advantage of a knowledge of the language. Unfortunately we could none of us induce him to narrate his experiences, though we drew our own conclusions when we learned that he was short of money all the homeward voyage.

III.

At the club banquets Britishers are treated with particular favour and respect. After the speeches have been interpreted to them by men who seem to speak all languages, they are invited to ask questions. Our boson rose to the occasion, somewhat unsteadily, it must be admitted, and expatiated on the beauty of ideals, the cussedness of human nature, and many other topics, until the pianist drowned him by striking up 'For he's a jolly good fellow,' in which the comrades joined. Thereafter he was charged to tell the workers of England what they were missing by their conservatism; to prove to them what fools they are; to bid them open their ears to the teachings of the wise and the liberated, and to follow the red flag to—the translator actually said heaven. He forgot for the moment that Bolshevism maintains there is no heaven, except it be the equality of comradeship. Nor is there a hell, other than that of Bolshevik making. The Bible and all that it stands for has gone by the board, while the new gospel that is preached in its stead left our representatives of the workers of England stone-cold. Some of them wanted to know why in a country of freedom they could neither receive nor send letters; why their pockets were searched by an armed guard every time they came ashore or boarded their ship. They were told to have another drink and get back to the *Gloriana*.

As the boson explained to me afterwards—he felt aggrieved at having been interrupted in his speech—the idealists forgot that every British worker who changed a pound note into rubles became a multimillionaire, liable to be shot at sight. He admitted that while he was among Bolsheviks he was a Bolshevik for the fun of the thing; but he failed to see any fun in being a conscript for a stingy lot of officials who were no better than himself, if half as good; men who bolstered up Bolshevism merely to keep themselves in a good job. 'They take all the meat out of the egg, leaving the shell to the poor devil who does the work,' he declared; 'and they glibly tell us they are going to do in a generation what Christianity has not succeeded in doing these thousand years!' It should be explained that at home the boson is a red-hot socialist, a stickler for equality when it concerns the man above him. At first he was impressed when he saw the governor of the district, who had been a baker, sit down and smoke a cigarette with his dock-labouring comrade. Yet when he learnt that while he was banqueting with the labouring comrade in the dingy club with only a piano to play the music, the governor with his associates, the masters of vessels in port and heads of departments, was banqueting in the gilded chamber with a large orchestra to give sparkle to the champagne, he dismissed Bolshevism as a fraudu-

lent system of class distinction. It merely put the baker into the shoes and position of the murdered duke, and he was jealous of this power to which he had no title; a more vicious taskmaster than any plutocrat, because only by this means could he hope to maintain himself in a position for which he was wholly unfitted. Because of these anomalies, it is safe to say that Bolshevik propaganda among our crew missed fire. In fact, the effect was exactly the reverse of that intended, for the majority of our men were so disgusted with what they saw that they became rabid anti-Bolsheviks.

It is difficult to imagine any one who has lived under Bolshevism, except those who profit by it, adopting any other attitude. Imagine a man sitting in a draughty hovel shouting that he has found the best abode in all the world, and you can visualise Bolshevik Russia. The best hotel in the port where we were, once a gilded resort of fashion, is now one of those draughty hovels. Some of the gilded furniture still remains, but it has been wantonly cut and hacked with swords and bayonets so that there is scarcely a chair safe to sit on. Doors hang perilously on one hinge; bayonets have been jabbed through the panels; the skirting has been ripped, presumably for firewood; and there is scarcely a whole pane of glass in the windows to keep out the wind and rain. Deep trenches were dug in the streets by the revolutionaries, where they remain to this day, a barrier to traffic and a danger to pedestrians, particularly at night, when Stygian darkness reigns over the town. The electric power-station broke down some months ago, and nobody seems to have the authority or the knowledge to put it right. A recent blizzard blew down the electric and telephone wires, so that the streets now resemble the front in Flanders after the tanks had crossed. To prevent accidents, the authorities have forbidden any one to appear in the streets after 1 A.M., under penalty of being shot at sight.

As for the shops—and they were once the most attractive in Russia—they are closed and their owners vanished. All business is a monopoly of the universal provider—the state. It runs a market, at which the fortunate few who possess the means may purchase fixed quantities of food at controlled prices. Those who have no rubles must line up before the district distributing-agencies, and patiently wait for such doles as may fall to them in season. There is not a restaurant at which a stranger may procure a meal. Even in private houses you cannot be offered hospitality, for the people can scarcely get sufficient food for themselves, and the Bolsheviks took from them all crockery and cutlery, leaving only a cup, a plate, and a knife for each inmate. They have even taken the houses, confining the original owners to two or three rooms, according to the size of the family, and

crowding into the remaining rooms whom they choose. There is no privacy, no home life; a man may not even call his thoughts his own. In a word, communal and family life have ceased entirely, and there is nothing to take the place of either. There is no public spirit, no organisation; only devastating, hopeless chaos. And when you speak to the zealots of this they cheerfully tell you that all will be well a generation hence; all will be still better when the world turns Bolshevik. The shortcomings of the present are a legacy of the curse of the past, and will be forgotten when the glory of the daystar arises.

Meantime the Red Army marches in rags and tatters, buttonless and almost bootless, moodily chanting songs of the red flag. Their comrades work for ten hours a day at the harbour, for which the state charges the ship six shillings and sixpence. Of this the comrade gets less than one-third for himself and family; the remainder goes to the upkeep of the Red Army, the equally numerous army of officials, and the state. All workers are conscripted; their tasks are allotted to them by the Dictator, regardless of their capabilities, physical or mental. If they disagree with him an ounce of lead may settle the dispute, or a term in the ranks of the Red Army may cure the malcontents. They have no personal freedom, for they are tabulated and listed, and cannot, under dire penalties, move from one town to another. In a word, they have become slaves to that system which promised them ideal circumstances, and they have been made to feel their utter helplessness and dependence upon it. They have been cowed into submission.

IV.

How long they will continue to submit is a question which it would be foolish to try to answer. The Russian is long-suffering, but once he is roused he can become terrible, as the Bolshevik movement is in itself convincing proof. He is giving the experiment a trial, though he is far from satisfied, much less happy under it. The pillars of the movement know this, and periodically arrange flag-waving processions, followed by unlimited free drinks, to cheer the drooping spirits. Yet when you gain the confidence of the more intelligent among them, they tell you that Russia is not Bolshevik; that its teeming millions are under the rule of less than a million advocates of the movement—those whom it has placed in political power. In other words, the real Russian looks upon Bolshevism as another name for the ruling class. In the country districts the only people who have been influenced are those who have been given the lands stolen from their real owners. The peasant population has not yet recovered from the first shock of surprise; all that most of them understand is that Bolshevism is a

destroyer of their beliefs, their ikons, and their churches. This they resent, for they are deeply religious; and it is certain that sooner or later their zeal for the old faith will find expression in action against the despoilers. Their present attitude is that of dumb onlookers, not of active participators in events. They are afraid to speak, for they have witnessed only too many evidences of the summary justice dealt out to those who gainsay their new rulers. They know that Bolshevism is maintained by a highly organised system of espionage; that their nearest neighbour may be one of the secret agents, on whose testimony they may be shot or cast into prison without trial or explanation.

This is the sort of thing that happens. A Mr X. (let us call him that for his own safety), a man of considerable wealth in the days when a million rubles were worth a hundred thousand pounds, instead of less than one pound, according to present values, has been imprisoned six times during the last two years; that is to say, that during this time he has been liberated for periods varying for three days to six weeks. No charge has been preferred against him, nor is any explanation given when he is set free or again arrested. He is left to imagine that he is under suspicion of being implicated in the smuggling of gold and precious stones out of the country. Since the introduction of the order confiscating all articles of jewellery, people have been endeavouring to get their treasures and keepsakes into a place of safety. In spite of the vigilance of secret agents these things continue to cross the frontier, and in order to put an end to this traffic all people who are known to have connections abroad have been placed under lock and key.

It might be argued that Mr X., who is not a Russian, should make use of his periods of freedom and flee the country. This is no easy matter, for the Dictator realises that people of the type of Mr X. are more dangerous outside Russia than they are in it; they might discredit Bolshevik propaganda by telling the truth about the actual conditions under it. Therefore he has robbed them of their passports, thus depriving them of freedom of movement, for even did they succeed in escaping, they would not be permitted to land in any other country.

V.

Here is an experience we had of the difficulty of getting out of Russia. As there is little likelihood of the *Gloriana* returning to Russia, since she has been sold, the Bolsheviks may have the story for what it is worth to them. Our mate and engineer were ashore watching one of the flag-waving processions: a Red Army victory anniversary, celebrated as a general holiday. They were conscious of being shadowed, and when passing through one of the quieter streets a gentleman addressed them in

perfect English. He asked them if they would assist in helping a girl to escape whose life was in danger because she belonged to a family that had stood high in the late Tsar's service. She had had the luck to escape the rifles of the revolutionaries during the massacre of the aristocrats, and had been in hiding ever since. If she were found by the Bolsheviks her crime would be that she had not registered under their scheme for service, and all those who had assisted her in evading this would be punished with her.

Had they been offered a sum of money to help her to escape, the likelihood is that both the mate and the engineer would have refused to have anything to do with it. But they found it difficult to turn a deaf ear to this appeal to their chivalry, especially when they saw the hated aristocrat, a young woman in the early twenties, whose beauty was her passport to their sympathy. All she wanted them to do for her was to take her to the first port of call, from which she hoped to make her way to a near relative,

whose address she showed them, and who had the good fortune to be out of Russia at the time of the revolution. Our mate and engineer set their wits to work, and the night before we sailed a young fellow came on board, accompanied by the latter. Both passed under the scrutiny of the sentries, and disappeared down the engine-room. Next day the *Gloriana* was thoroughly searched from stem to stern, and the authorities permitted us to clear the port. Five days later we touched our first port on the homeward run, and the young fellow, again accompanied by the engineer, went ashore in the dark. The daughter of the late Tsar's servant had escaped. And she deserved to get away, after lying for six days on board, nearly smothered in ashes and oily cotton-waste. Not only were the Bolsheviks outwitted; the mate and engineer managed things so well between them that very few on board, least of all the captain, knew anything of the shipmate we carried. Let it be hoped she succeeded in finding her near relative.

A GIPSY OF THE NORTH.

CHAPTER VII.—*continued.*

CARWYKE, whilst he kept his ears open, watched Marya. That she stood in fear of Nicholovitch was evident; but there was something else about the woman that held his attention. More than once he saw her glance furtively at the trader, a puzzled look upon her dusky face, as if she strove to fathom his purpose, and the watcher easily divined that Nicholovitch's present demeanour was strange to her; and once he saw her dark eyes look at Norma with a jealous gleam in their depths. When he saw that, he understood. The woman was afraid lest this new-comer, a woman of the white race, should usurp her place at Little Novgorod. He could have laughed aloud at the thought, but for the fact that the giant's demeanour lent colour to it. More and more the trader addressed himself to Norma, and there was in his manner and speech an exuberant familiarity that Carwyke did not like, for it boded trouble, whilst it most evidently distressed the girl herself. To save her from the man's familiar speech he made a diversion.

'Novgorod is a lonely post, Nicholovitch. Is there much trade here?'

'As much as I can carry in my two arms, little brother,' answered the trader. 'But what of dat! Soon I shall be as rich as dat dam' Rockefeller.'

'Oh!' cried Billy. 'Then yo've found gold, Mista Nicholovitch?'

'Gold!' the Russian chuckled, and then his bellowing laugh filled the room. 'Yes, mooch gold.' His pig-like eyes, half-hidden by wrinkles

of merriment, for one brief second flashed a glance at Norma's head. 'Mooch gold!' he repeated; 'and I haf not even to dig for it.'

'Then it's in ther river, Mista?' cried Billy excitedly.

'No!' roared the trader, shaking with laughter. 'It is yet far away; but it is under my hand—so!'

As he spoke his arm shot out suddenly, and his huge hand for one moment rested on the girl's shoulder. Carwyke, anticipating evil, half-rose from his seat, but the giant, still laughing, withdrew his hand, and gave his attention to the cold moose-joint which the half-breed Marya had just set on the table. At the same moment the prospector caught the woman's eyes. There was, he was sure, a warning in their dark depths, and a second later, standing behind the bully, she made an imperative gesture with her arm. 'Go!'

He knew that was the meaning of her action, as surely as if she had spoken the word; and as her gaze flashed from her brutal master to Norma he understood what was in the woman's mind. There was danger for Norma—for all of them in this lonely trading-post. He nodded his understanding, and whilst the Russian carved the meat, his mind worked feverishly. It was impossible to leave before the end of the meal. To attempt to do that was to precipitate the trouble that was plainly brewing. The meal must be eaten, and a little stay made before he could talk of continuing the journey. He glanced at Norma, and even whilst she ate saw

her eyelids drop sleepily. The toils of the day had left her bone-weary, as he guessed; and until she had slept, any more exertion on her part was almost impossible.

But it was not safe to sleep in this post. Peril, as he was sure, lurked all about them, and if they were to resume their journey unscathed the utmost vigilance was necessary. His mind reverted to the moments of their encounter. He recalled the excitement the man had exhibited on hearing Norma's surname, and Billy's conviction that the Russian had been lying when he had denied having heard the name before; then the fellow's odd action in laying his hand on Norma when he had spoken of the gold that was under his hand! In heaven's name, what did it all mean? For a second his mind went back to Standifer. Did that scoundrel also know something about Norma—something that he shared with this bullying Russian? He could have laughed at the idea. It was so grotesquely improbable, and yet—

A sudden movement on the part of the trader broke in on his thoughts. The man rose from the table, growling an excuse. 'I cannot eat, no! But I will of the vodka drink.' He moved away from the table, helped himself to the potent spirit, drank, and that done, took from a shelf a bundle of old newspapers. He searched amongst them, and took out one of the big, coloured Sunday editions popular in the States. With this in his hand he stumbled to the window, and there, his brows creased in the effort, he appeared to read a passage in the paper.

Carwyke watched him curiously, and glancing at Billy, saw that he also was watching the Russian's odd action with wondering eyes. After a minute or two the trader dropped the paper, emitted one of his rumbling laughs, and then addressed himself to Billy. 'You ask me of the gold dat I do not dig, hey? Dere are seven million dollars dat are mine—'

'Seven million dollars?' cried the ex-whaler.

'Yes! And I do not dig for dem—no, but I fight—so!' The man's laughing demeanour suffered a lightning change. Letting loose a roaring bellow, with an astonishing swiftness he picked up Billy from the stool on which he was seated and literally flung him at Carwyke. The prospector, borne down by the weight of his companion, crashed to the earthen floor with the ex-whaler atop of him; and in the same second the giant threw himself upon them, his great hands feeling for their throats.

Norma started from her seat and cried out in horror as she stared down at the human tangle, and the woman Marya came running to the room. She looked fearfully at the trio struggling on the floor. The Russian was growling like a baited bear; Billy was babbling odd curses learned in the fo'c'sles of whaling-ships; and only Carwyke was grim and silent as, grasping

the great beard with one hand, he jabbed the snarling, brutish face with the other. With a great effort the Russian suddenly lifted himself to his feet, dragging Carwyke with him. The two whirled round, then the ex-whaler, trampled upon by both, gripped the trader's legs and brought him crashing to earth once more, where again all three rolled over and over in a mad struggle for mastery. Once Billy, being on the top, was flung clear as if he had been a feather blown by a puff of wind; but, before he could pick himself up, the other two rolled over on him, and once more he was involved in that tangle of fighting humanity.

Norma stared like one frozen in terror. Never in her life had she seen men so fight with all the brutish instincts unchained. Back against the wall, where a sudden whirl of the struggle had thrown her, she watched, fearful of the issue. Then a hand was laid upon her arm. The half-breed woman was standing by her side, an odd look in her dark eyes. 'Queeck!' she cried, and urged Norma towards the outer door. 'Neek want yo'. Eef dey not keel heem he take yo'!

A new and sudden fear gripped Norma. With the woman's hand upon her arm she ran from the house to the landing-place, and swift as thought almost was afloat in her kayak. The half-breed waved a hand down-river. 'Me tell yo'r mans——' she cried, and then fled back to the house.

(Continued on page 157.)

MIXED MOTIVES.

As you travel the highways and byways of life
With its joys and its sorrows, its peace and its
strife,

You will find it a truly felicitous plan
To mingle your motives whenever you can.

When honestly working with hands or with head,
You are doing your duty, and earning your bread;
So when you are playing, give vent to your mirth,
And join in the frolic for all you are worth.

Give pleasure to others wherever you go;
Inspirit the weary, and sympathy show;
It then will befall, as a matter o' course,
In sharing the burden you lighten the cross.

When you go for a walk in the country or town,
As you pass thro' the streets, or tramp over the
down,
While training the body, enlighten the mind,
By carefully noting whatever you find.

If in crossing the fields you should chance on a
stile,
Let Nature enfold you, and rest for a while;
Or if to a church you should haply repair,
Consider the fabric, and whisper a prayer.

These random ideas came into my head;
There are various others between aleph and Z
That prove it a thoroughly laudable plan
To mingle your motives whenever you can.

JAMES T. JOHNSTON.

THE MONTH: SCIENCE AND ARTS.

A MACHINE FOR WIPING GLASSES.

THE rinsing and wiping of glasses in hotels, hospitals, schools, and other institutions is, in the aggregate, a big operation. It is not surprising, therefore, that attempts have been made to devise mechanical appliances which will expedite the process. So far as the rinsing is concerned, a simple and effective arrangement of water-jets performs this operation as quickly as the glasses can be put on and taken off the device. Each glass is placed upside-down on a horizontal plate, which has a water-pipe standing up in the middle, and a ring-pipe outside the glass about half-way up. Both pipes are perforated with tiny holes, from which jets of water issue when the supply is turned on. The plate upon which the glass stands slides over the vertical water-pipe, which passes through it to supply the jet-nozzle. A lever under the plate opens the water-valve when the glass is pressed downwards. As the glass is removed, the lever is pulled up by a spring, closing the valve again, and pushing up the plate; hence no water is wasted. The bottom end of the vertical pipe is connected to a horizontal pipe, from which a connection rises to the jet-ring outside the glass. Such are the essential features of the device, which is made of gun-metal and is nickel-plated. It is supported on a short stand-pipe with a screw-down valve to shut off the water. The wiper consists of four horizontal spindles arranged symmetrically about a central spindle, all being rotated at a high speed by a tiny electric motor. On each spindle are a number of calico discs, which are quite limp when stationary, but which are stiffened by centrifugal force when the spindles are rotating. An electric heater under the spindles produces an upward stream of hot air which dries the calico discs between the taking out of one glass and the insertion of the next. Each glass is held by the bottom and pushed in between the spindles, the central one wiping the inside, while a quarter turn exposes the whole of the outer surface to the action of the discs on the outer spindles. The discs are easily replaced by fresh ones when worn or dirty. Below the heater is the motor, which drives pulleys on the back ends of the spindles by a leather cord. The whole contrivance is mounted upon a cast-iron frame, and is enclosed in a removable aluminium cover. It will dry and polish a wet glass as quickly as it can be inserted and given the quarter turn.

A TURBINE-ELECTRIC LOCOMOTIVE.

Among high-powered steam-engines the railway locomotive stands out as the most extravagant in its use of coal, this feature being due to the blowing away up the chimney of the

waste steam from the cylinders instead of its being condensed. The advantages of condensing will be better understood when it is remembered that the earliest steam-engines were worked entirely by condensing the steam, whereby a vacuum was left in the cylinder, which sucked down the piston; or, to be more correct, the pressure of the atmosphere (14·7 lb. per square inch) above the piston forced it down. The steam used had no pressure, as generally understood, yet considerable powers were developed in this way. Roughly, a steam-engine which gives out 10 h.p. when the waste steam is blown away will develop up to 20 h.p. if it is condensed. There are also minor sources of waste in a locomotive. Moreover, while the most economical steam prime mover, the turbine, can be employed directly to start a heavy train, many advantages are gained when it is caused to generate electricity which is used to actuate electric-motors on the axles. This system has been adopted in the Ramsay locomotive, which is being tried on the London Midland and Scottish Railway. It would be impossible in the space available in one of these notes to give a complete description of this interesting development; hence only the general features are touched upon. The boiler is similar to that of any other locomotive, and it provides the necessary steam at a pressure of 200 lb. to the square inch. On one side of it is mounted the main steam turbine, which is coupled to an electric generator. This machine runs at 3600 revolutions per minute, and develops 890 kilowatts (nearly 1200 h.p.), the pressure being 600 volts. A supplementary turbine drives a comparatively small dynamo, which provides current for 'exciting' the magnets of the main generator, for driving various auxiliary motors, and for lighting the train. The most interesting item of the equipment is the condenser, which is mounted on the tender. It consists of large numbers of tubes built into the form of a hollow cylinder, with a 'header' at each end. This cylinder is slowly rotated by an electric-motor, the lower part dipping into a tank of water. During their rotation above the water the tubes are subjected to a strong current of air, which has a powerful cooling effect by evaporating the water; the result being that the steam inside the tubes is condensed, and a vacuum is formed, which materially increases the power of the turbine, as already indicated. Although some water is lost by evaporation, the amount is small compared with that blown away in the form of steam in the ordinary locomotive. Both the engine and the tender have three coupled driving-wheels on each side. The motors can develop continuously 275 shaft-h.p. each at 1175 revolutions per minute, while for an hour each

is capable of giving out 360 shaft-h.p. Two are coupled, through gearing, to the engine wheels, and two to the wheels of the tender. For reasons which cannot be explained here the motors are capable of exerting three times the twisting power at starting that they do when running. This locomotive has hauled a train weighing 275 tons at a speed of 60 miles per hour for 100 miles. It burns about half the coal required by the ordinary locomotive, and needs only a fraction of the water, while it has other advantages.

A DIESEL-ELECTRIC SHIP.

Side by side with the development of the turbine-electric locomotive described above is that of the Diesel-electric ship. Instead of the Diesel engine being coupled to the propeller shaft, it is made to drive a dynamo, from which current is transmitted to a motor which drives the propeller, and is placed close to the stern of the ship. Several advantages are claimed for this system. For instance, two or more light, high-speed engines may be used to generate the electric current, although the motor on the propeller shaft may run at a slow speed, which gives the highest propeller efficiency. Then the engines can be anywhere in the ship, while they do not take up so much space as does a single slow-running engine; hence there is more room for cargo. Other advantages include perfect speed control (from the bridge, if desired); a reduction in the weight of the propelling plant; simpler engines, because no reverse gear is needed; no risk of the ship being held up by engine trouble. The first large ship to be fitted with this system, *La Playa*, was recently completed by Messrs Cammell Laird & Company, of Birkenhead, for the United Fruit Company of Boston, U.S.A. Having a cargo capacity of 5000 tons, this vessel is fitted with four Diesel engines, each of 825 shaft-h.p., which drive four 500 kilowatt dynamos. The motor on the propeller shaft is rated at 2500 h.p. Another advantage worthy of mention is that no extra engines are required for supplying electric current for lighting and power. In this case the aggregate horse-power of the motors used in the ship for the refrigerators, cargo-winch, steering-gear, and other purposes is no less than 950 h.p. Two sister ships are being built for the same owners, one of which is nearing completion. It is admitted that slightly more fuel is used in the Diesel-electric system than in the usual direct-coupled plant, and that the machinery is more costly, but the owners still consider the plan worth while.

A NEW FORM OF FERRO-CONCRETE PIPE.

Ferro-concrete pipes for large water mains and sewers have been in service for many years. Recently a compound pipe, in which a steel shell gives the strength, while concrete affords protection against corrosion, has been

devised by Mr F. W. Macaulay, M.Inst.C.E., the chief engineer to the Elan Valley water-supply scheme for Birmingham. About 900 yards of pipes constructed on this principle have been laid. Measuring 5 feet in diameter inside, each pipe is 12 feet long, and consists of a steel tube, three-eighths of an inch thick, which has a 1-inch lining of concrete (centrifugally applied) inside, this being reinforced with expanded metal. Outside, the steel tube is coated with concrete to a depth of from 4 to 6 inches. The outstanding advantage of the system is the lightness of the pipes, their weight being about half that of ferro-concrete pipes made in the usual way. That the strength is ample is proved by the fact that the pipes described are capable of withstanding a pressure of 175 lb. per square inch.

ROTATABLE CRYSTALS FOR WIRELESS RECEIVERS.

Those who have crystal listening-in sets will be interested in a device for rotating the crystal so that any part of it can be brought into contact with the catwhisker. The crystal is held between two tiny brass cups with serrated edges. One has a short stalk at the back, which turns easily in a horizontal hole in a small brass pillar. The other cup has a much longer stalk, which passes through a hole in a similar pillar, the back end being fitted with an ebonite knob. Between the pillar and this cup is a spiral spring. When a crystal is to be inserted, the cup with the long stalk is pulled away from the other by the knob, against the pressure of the spring, returning to grip the crystal tightly when released. The crystal can be rotated by the ebonite knob, thus exposing every part to contact with the catwhisker except the small portion masked by the cups, and obviating the necessity for groping to find a sensitive spot. The catwhisker is carried in the usual type of holder, which is gripped by a spherical part. The latter rests in a spherical seating at the top of a short brass pillar. It is locked by a crossbar over the top, which is screwed down at each side by a thumb-nut on a brass stud. The fittings described, together with two terminals, are mounted on an ebonite plate measuring 3 inches by 2½ inches, the connections being made in slots underneath. The rotating crystal-holder is easily applied to existing sets with fixed crystal cups.

AN INFINITELY-VARIABLE SPEED GEAR.

The ideal change-speed gear for cars that every one has been anxiously awaiting is one with which any speed can be obtained, from zero to maximum. With electric transmission this ideal has been realised; but, until recently, no mechanical device has been developed that would do more than give a small number of definite speeds. Now, at least two inventions have been tested which claim to solve the problem. The one dealt with here, of French origin, consists of what can be best described

as a wobbling plate, from which connecting rods 'take on' to what are effectively pawls and ratchet wheels on the driven shaft. At the rear end of the propeller shaft is a cylindrical block, the axis of which is at an angle with the axis of the shaft. The consequence of this angularity is that as the shaft revolves the block wobbles round. Mounted on the block, but with a ball-bearing between the two, is a sleeve upon which are mounted six radial pins having spherical heads. As the block wobbles round, so the sleeve and pins wobble also, but do not rotate. It is easy to understand that if a rod is connected to one of the pins, and the other end is provided with a pawl, the pawl can be made to rotate a ratchet wheel. If all six connecting rods were made to drive as many ratchet wheels the motion would be much less jerky, as one or two would always be engaged. But pawls and ratchets, at their best, are unsatisfactory. What is wanted is a device that will slip one way and grip instantly the other. This has been very ingeniously accomplished. Imagine two concentric rings, the outer representing the pawl, and the inner taking the place of the ratchet wheel. A space is left between the rings to be filled with alternate blocks and balls. Each block is square in section if cut through circumferentially, but the ends which are in contact with the rings are curved. These blocks are not quite radial, with the result that if an attempt is made to move the outer ring one way the blocks jam, but they slip easily in the other direction. There are six of these free wheels, so that the driving strokes overlap, and give a practically continuous motion; e.g. on the top gear of 4 to 1 the rear wheels receive 24 overlapping impulses. A separate reverse gear is fitted. We now come to the very interesting method of varying the speed. If the block were tipped so as to bring its axis parallel with that of the shaft it would cease to wobble, and the sleeve and the connecting rods would become stationary. In this condition no motion would be transmitted to the wheels; in fact, the gear would be at zero. Therefore the speed varies with the angle of tip. By an ingenious arrangement of slots and pins the angle of tip is reduced when the block is moved towards the back axle. The connecting rods pull the back axle round, and therefore tend to pull the block into the zero position, and thus lessen the stroke and lower the gear. This tendency is controlled both by the inertia effect of the block and by a special spring, so that the effects, not only of road resistance, but also of throttle-opening, are taken into consideration. The only drawback to this gear is that the wheels cannot be made to drive the engine, thus having a braking effect; but against this feature must be set the automatic lock against running backwards downhill.

STEEL BALLS FOR POLISHING SILVER.

It will come as a surprise to most people that steel balls such as are employed in the bearings of bicycles can be used to polish silver spoons, forks, and other articles. Yet this is the case, if the silver ware and the balls are shaken up together in a vessel containing a special solution, in which soap predominates. For polishing, or, more correctly, 'burnishing,' large numbers of silver articles a machine is used. The silver ware is placed in an octagonal cast-iron, teak-lined drum, measuring 10 inches across inside by 28 inches long. This drum is mounted upon trunnions, which run in bearings in two cast-iron frames. One of the trunnions projects beyond its bearing, to be fitted with a worm-wheel, whereby the drum is rotated at 32 revolutions per minute by a $\frac{1}{2}$ -horse-power electric motor. A door extending round three sides of the drum, and screwed down upon a rubber joint by hinged bolts, gives access to the inside in a few seconds. Two sizes of machine are made. The smaller, of which the inside dimensions of the drum have been given, will take 350 spoons and forks at a time. When the articles are taken out after ten minutes treatment they look like newly-plated ware. About 3 cwt. of balls are kept in the drum, and they are of rustless steel. In addition, there is a number of hollow rubber balls, about the size of tennis-balls, which assist in agitating the mixture of silver ware and steel balls. Finally, the drum is filled up to the door-joint with the special soapy solution. Hollow ware, such as teapots, jugs, and similar articles, are hung by their handles upon horizontal, removable, wooden bars, which fit into sockets in the ends of the drum. A galvanised steel trough under the drum catches any leakage, also the balls and the liquid, should it be necessary to empty the drum at any time. It is claimed that so little silver is removed by burnishing in these machines that the thickness of silver-plating would only be reduced by one-third of 1 per cent. in from twenty to thirty years.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE WHITE HERD.

By LEWIS SPENCE.

PART I.

I.

I HAD been drawn to Joyce's Country, that desolation of gorse, boulder, and marshland which lies between Lough Mask and the Mam-turk Mountains on the borders of Connemara, not by any lure of wild beauty which some profess to find in its desert confusion, but because it appealed to me as a fitting environment in which to capture the atmosphere of savage gloom I wished to reflect in my 'Tartarus' symphony, the outlines of which were then taking shape in my mind. I had been privileged to view a series of striking landscapes of the country painted by a friend who seldom exhibits publicly, and, a week after seeing them, was on my way to Galway.

On my arrival in Joyce's Country I found that it realised with marvellous fidelity my conception of a waste prepared for the reception of the doomed, even more faithfully, indeed, than my friend's pictures had led me to believe. The gray monotone of the land, the harsh skies, the distant glooming of an iron sea, the more immediate menace of overhanging heights—here, indeed, was such a region of shadows and terror as that in which Orpheus might have sought the dim likeness of his dead Eurydice. For me, at least, this was Tartarus.

My cottage beneath the brows of Partry was little better than a cabin, a place of three rooms, one of which was inhabited by the silent man and woman to whom the place belonged. It topped a rise, commanding a sweep of country from the black borders of the hills to the hedges and pales of wooded Castle Bolding, two miles to the south-east. And when the wind blew from that quarter I could hear the bellowing of the White Herd. Never did bugles on the marches of warring nations sound a music more fitted to their environment. The herd had been maintained in that region, said tradition, for generations—an ancient strain of wild Irish cattle, milk-white, pure and uncrossed, as when a native king had first gathered it together. I had walked by the great park at Castle Bolding in which it was now confined, and had glimpsed tossing horns, flashing red eyes,

and the swift movement of gleaming white shapes among the oaks and beeches which screened the place.

I quickly realised the almost peninsular isolation of the neighbourhood, and its extraordinary hold upon ancient custom and hard-dying prejudice. Neither Brittany nor Galloway is so far beyond the world's edge. Here the Norseman found the Iberian, and wrestled and mingled with him to the making of a man of iron, cold and morose to strangers, neither warm-hearted nor irascible, like the men of the south-west, but grim and distrustful. A dread of the region had come upon me too, such an awe as, I have heard, is aroused by the sombre and rock-bound spaces of Iceland. The tall frown of Partry was strong upon me; the gray stretches of moorland appalled by their utter bleakness; the stern furrows of the sea chimed too much with the mood and colour of the land to bring any relief of variety. If the shadow of doom ever hung over any land, it was surely over this. And in the pauses of the strange speech of wind and sea came the bellowings of the White Herd like threatening trumpets, 'ancestral voices prophesying war.' It was a stage set for tragedy in the high manner, tragedy as we find it in the northern sagas, a cup to be drunk to the bitter dregs.

II.

The first act in the drama for which I had been unconsciously waiting was not long in beginning. I was sitting at the door of my cottage one afternoon in early September, trying to capture the atmosphere of moor, fell, and sky in the musical shorthand I was jotting down, when I was surprised to hear a clatter of hoofs coming from the road below. Scarcely a soul, gentle or simple, ever passed that way. Looking down, I saw what I took to be a couple of horsemen trotting along at a fair pace, but as they came nearer, and climbed the rising road which passed my porch, I noticed that one was a woman. So still was everything that I could catch the broken sounds of a conversation, the tones of which seemed pitched in no amiable key. The pair, I could see, were so engrossed

in an altercation as to be oblivious of my nearness. They were, perhaps, a hundred yards from me when I saw the woman suddenly rise in her stirrups—she rode astride—and slash fiercely at her companion's head with her whip. Even at that distance I could hear the vicious thud of the blow. The man reeled in his saddle, and clapped a hand to his face. But when the girl made off at a round gallop he followed, and, as they came up to where I sat, was almost level with her. She pulled up and dismounted. I do not remember ever seeing a woman in such a transport of anger. Her fair face—she was blonde in a cold, dazzling, northern way—was pale with fury, her blue eyes blazed like ice in sunshine, and she pointed her whip at her late escort with a gesture of such withering contempt as would have made most men turn rein and gallop off without more ado.

'You seem a gentleman!' she flashed at me, the words leaping from her lips with the swiftness of great agitation. 'That cur—thrash him—thrash him, I tell you, within an inch of his life.'

'Better try,' snarled her companion, glaring at me as if he had found what he sought—an antagonist upon whom he could wreak the bitterness which seemed boiling within him.

'You both seem excited,' I said soothingly; 'try to control yourselves.'

'Control myself!' almost screamed the man. 'Do you see this?' He pointed to a long, ugly weal which made a dark purple line between eye and mouth. As he touched it it bled freely, and he stared blankly at the stain it left upon his fingers. This seemed to drive him to a frenzy. He even made a threatening movement toward the girl. I stood in his path and motioned him back.

He was on me like a whirlwind. He dropped his whip and leapt at me so fiercely that, taken unawares, I went down at once. He fell on me, and we rolled over and over in the dust. His hands were at my throat. Unused to this kind of thing I struggled awkwardly, floundering, trying to down him by sheer weight. Then I heard the impact of a blow close to my head. My antagonist groaned heavily, and fell back. I scrambled to my feet. The girl was standing over him, whip in hand. He lay inert, his head in a little pool of blood.

'Good heavens,' I exclaimed, 'you've killed him!' Despite her vital beauty, her Grecian cleanness and suppleness of shape, I shrank from her. She seemed not the least disturbed.

'You shouldn't have struck him so hard,' I mumbled.

'I hope he is dead.'

I gazed at her in horrified amazement. She looked, I thought, like one of those fair, muscular heroines of Norse saga, such as took a strong hand in the minor killings of hereditary

enemies in 'Burnt Njal,' the apotheosis of the barbarian Amazon.

'Help me to carry him indoors,' I asked her.

'He may lie there for me,' she said contemptuously, without stirring.

III.

Not without effort I raised the fallen man and carried him into the one bedroom of the cottage, where I laid him on the bed. He breathed heavily, and bled abundantly. I examined the blow he had received, and saw that, although it was not serious, it was sufficiently alarming. At first I had thoughts of sending for a doctor, but, after I had bathed the wound and administered a small quantity of spirits, he regained consciousness, sat up, and looked about him in a dazed way.

'You must lie down,' I told him; 'you are pretty badly hurt.'

'Who the devil are you?' he growled.

'Basil Dean is my name. And yours?'

'Rupert Bolding—down at the park yonder.' He nodded a bandaged head in the direction of Castle Bolding. 'But where's that little vixen gone?'

'You mean the lady who was with you?'

'Yes; Helga Bolding, my cousin. It was she who struck me, I suppose?'

I nodded. So Helga was her name? Well, it certainly suited her.

'I think she is still outside,' I said. 'I will see.'

I stepped out onto the road, but not a sign of the girl or either of the horses could I see. Then I heard the distant clot-clot of hoofs from the plain below, and descried them, a small, moving bunch, nearly a mile away, trotting quickly for Castle Bolding.

I returned to the bedroom. 'She's gone,' I announced, 'and has taken the horses with her.'

He made an angry face. 'Little devil,' he snarled. 'Just like her. I'll have to walk it, I suppose?'

'You certainly can't walk yet,' I said. 'Better lie back and rest awhile. You've had a nasty jar. Perhaps you deserved it.'

'Don't talk like a child, man.' If she was a Valkyrie, he was certainly Hector of Troy, bullying, almost malignant. 'If you'd been where I've been, and knew women as I know them, you wouldn't excuse that little leopardess.'

'Yet you excuse yourself by quoting the custom of some outrageous corner of savagery,' I said sharply, nettled at the contempt in his tone. 'Pull yourself together, Mr Bolding.'

'Don't preach at me, you silly ass!' he jeered, with a sour smile and a grim lighting-up of his deep-set eyes. 'You're just the sort of chap who'd excuse a woman for taking an axe to a man who tried to snatch a kiss from her.'

'Lie down, man!' I said sternly. 'You can't

afford to get into a state. You're badly hurt. Be reasonable, and take a sleep to yourself.'

'I suppose you're talking sense,' he growled. 'Well, here goes;' and, smothering a groan, he turned his face to the wall. I pulled down the blind and left him.

At the door Kelly, from whom I rented the cottage, was standing. He had just returned from his day's work, and was looking with amazed eyes at the sanguinary signs of struggle in front of his dwelling.

'Kelly,' I said, 'there's been a slight accident. Mr Rupert Bolding has been thrown from his horse, and is lying down in the bedroom. Is your wife at home?'

'Misther Rupert Boulding, is it?' he said, a queer smile flickering across his dark face. 'No, sor, indade, me woife's at Misthress O'Dowd's. She'll be back prisintly, though.'

'Well, look here, I'm going to Castle Bolding. If Mr Bolding calls or wants anything, you'll attend to him, won't you?'

'Sure an' I will, yer 'anner. I'll give him a look now and agin.'

IV.

I jumped on my bicycle, and coasted down the rather treacherous hill-road into the plain. The mists, which usually fall in Galway with the approach of evening, were gathering, and the dull rose of a September sunset stained the black shadow of Partry, deepening to bronze above the hard, pale line of the distant sea. A vivid plume of orange light brushed the gray tower of Castle Bolding, making it seem like a strange blossom springing from the surrounding foliage of beech and oak. As I passed through the park I could see through the mist the gleaming shapes of the White Herd, some at rest, others galloping wildly in ever-lessening circles, as is the wont of those far-descended beasts, and I was thankful for the stout iron railings which kept them from the path. Only one of them, a magnificent bull, had so far overcome his native wildness as to approach the pale, and stood breathing his menace at me as I passed. He was a lordly creature, not large by the standard of modern judges, but deep of flank, powerful of shoulder, and white with the whiteness of milk, jetty of muzzle, and with red eyes filled with the noble rage of the tameless. As I wheeled by he greeted my passage with a scornful stamping, and bellowed twice, and from far away was answered by the trumpet-call of his fellows.

I inquired for Miss Helga Bolding, and was shown into the library. In passing through the hall I was struck with the extraordinarily mediæval atmosphere of the house. The entrance-hall and rooms were crowded with trophies of the chase—gigantic horns and antlers, the masks of boar and fox; grim weapons and armour from forgotten generations; dark portraits, which peeped out of the shadows like spectres

in an uninhabited mansion. Here was no intention to adapt the ancient to the uses of to-day. The place impressed me as if it had not been altered for a couple of centuries.

Helga Bolding entered. I had expected to see her dressed for dinner, but she wore a tweed skirt and a knitted jumper, which, if anything, made her look more athletic than her riding-habit had done. She approached me with an almost masculine stride, and stood gazing at me out of her clear, blue eyes. A disconcerting silence fell between us.

'I have called,' I said at last, and rather lamely, 'about your cousin, Mr Bolding. I thought you would have remained after—after the—accident.'

'He is not my cousin,' she said, with deadly coolness; and once again, from her tone and the calm fatality of her bearing, I sensed the atmosphere of the Icelandic saga. 'He is an impostor.'

Her directness almost dazed me. The situation struck me as preposterous in the extreme. The word 'impostor' smacked of drama and that kind of fiction which does not draw upon reality. But anything seemed possible at Castle Bolding, that house out of the Waverley Novels.

'I am afraid I don't quite understand the drift of things, Miss Bolding.' I was floundering badly. 'May I say that my name is Basil Dean? I am a composer of music.'

She gave not the slightest sign that I had spoken. I cursed the ill day that had soused me into this pother.

'I have not the least wish to pry into your affairs,' I stumpled on, 'but Mr Bolding—'

'He is not Mr Bolding.'

'Oh, indeed!' There was nothing more to say. What a fool I was to have come at all.

'There is nothing to hide,' she went on in a loud, challenging voice. 'My father died a year ago. The estate was entailed on my cousin Rupert Bolding, and this—man came here a week ago and claimed to be he. I discovered him to be an impostor. He refused to go, and I was on my way to the attorney at the village, when he followed me and tried to stop me. The rest you saw, when—when he tried to kiss me. I thank you for what you did.'

'What you tell me is very strange,' I said. 'I think you should lose no time in seeing your legal adviser.'

'I am not surprised that you should consider it strange,' she replied, a little scornfully. 'You must be wondering how I came to discover that he—that he was not Rupert Bolding. I have never even seen a photograph of my cousin, who went out to Burma in the Government Survey Service years ago. But I knew from his letters to an aunt that one of his ears was much mutilated by a dacoit knife. The ears of this person are not so mutilated.'

'He speaks of having been abroad,' I ventured. 'But what do you think has become of your cousin? Do you believe him to have been the victim of treachery?'

'I feel positive of it,' she said, 'only I have no definite proofs. These I may obtain, however. But I shall see the lawyer, who will know best what steps to take.'

'I shall not detain you longer.' I was much

impressed with what she had told me. 'I shall keep a close watch upon our gentleman, and possibly may learn something more about him than you know already.'

'If he only knew it,' she smiled strangely, 'he is running a great risk. If the people here find him to be other than he represents himself—well, they are strange folk.'

(Continued on page 163.)

THE ELASTICITY OF TIME.

By JOHN HOGGEN.

EINSTEIN notwithstanding, we continue to regulate our lives and adjust our work by the clock in the tower or the watch in the pocket. In ancient days, and among primitive peoples still, time is taken from the arrival and departure of migratory birds, the returning pest of the insect world, the growth of plants, the times of fruit and blossom, and other signs that denote movement and the passage of days necessary to bring such changes. The sun-dial, however, is surely the loveliest of all measurers of time. How many memories come to us of sunny gardens, with high box borders scenting the warm air, in the midst of which stands a sun-dial, bound about, it may be, with roses and honeysuckle; how much more beautiful it all is than an arrangement of wheels controlling a swinging rod, in a more or less ornate case on our mantel-boards!

It is true that Ben Jonson long ago taught us in a perfect lyric that the true measure of life is not time, but progress towards completeness; but it was the author of *Festus* that brought home still more acutely to men's minds and bosoms the fact that it is the contents of life that are time's master, when he sang in oft-quoted lines that we live in thoughts and feelings and 'not in figures on a dial.' 'The long and the short of it,' in fact, depends on much more than hours that merely pass. Charles Lamb, who (bless him!) was no great poet, touches the thought with solemnity when he tells us that each moment of misery is an hour, that joy passes like swift wind, and asks: 'How to a wicked soul must be whole ages of eternity?' 'At certain periods of life,' writes Thackeray in *Esmond*, 'we live years of emotion in a few weeks, and look back on those times as on great gaps between the old life and the new'; and George Eliot, in *Mr Gilfil's Love Story*, comments on the same experience: 'The conflict of emotion stretched into a long interval the few moments that elapsed before the door opened again.' If we give ourselves, or have administered to us, what Rabelais calls 'a pill to purge melancholy,' a quick change occurs, and we feel with Anna Karénina that 'there are whole months that you would sell for fifty kopeks, and

quarter-hours that you would not take any amount for.' Clearly, it is what happens in time that gives value and sense of length to its moments. 'Enjoy the day, and behold it shrinks to a moment,' George Gissing writes.

A curious sensation of long duration is sometimes brought about by the vision of something that moves us greatly. You remember that when Leigh Hunt showed Keats a lock of Milton's hair, the poet 'thought he had beheld it from the Flood.' He mentions a similar experience in *Lamia*, and a strange yet devout wish to annihilate time is expressed in one of the feeblers of his sonnets. George MacDonald and Oliver Wendell Holmes alike confessed that their thoughts were old 'as soon as born.' Holmes had, indeed, a peculiar fondness for tracing the source and the effect of unwonted emotion or shy, delicate fancies and impressions. While others were content simply to record such things, he followed them through processes of the mind if, haply, he might know their ultimate reach and significance. In *Elsie Venner*, for example, he describes an incident thus: 'Twenty-four hours after the falling of the cliff it seemed as if it had happened ages ago. The new fact had fitted itself in with all the old predictions, forebodings, fears, and acquired solidarity belonging to all events which have slipped out of the fingers of time and dissolved in the antecedent eternity.' David Copperfield's five days' imprisonment for biting Murdstone's hand seemed years—he seemed to have bitten him in 'a remote antiquity.' Modern novelists are liberal dispensers who make their men and women sweat with emotion, while their fore-runners preferred to make them faint; poets—the best of them, at least—follow Wordsworth's advice and remember emotion in tranquillity. But both contribute numerous instances of the varying sensation of time as wrought upon by emotion.

Shakespeare turns the subject over again and again. Rosalind is ready to sum up the matter with a woman's quick wit when she tells us that 'Time travels in divers paces with divers persons'—ambling, trotting, galloping, as the case may be. Juliet's rich, but impatient, passion

makes her cry: 'For in a minute there are many days'; Claudio believed 'Time goes on crutches till love have all his rights'; Cleopatra—rolling all her strength and sweetness into one ball, as Marvell has it—cries: 'Eternity was in our lips and eyes.' And Shakespeare, speaking in his own name, in Sonnet 57, uses the phrase: 'The world-without-end hour.'

De Quincey, describing how his sense of time was powerfully affected by opium, writes: 'The sense of space . . . did not disturb me so much as the vast expansion of time. I sometimes seemed to have lived for seventy or one hundred years in one night; nay, sometimes had feelings representative of a millennium passed in that time, or, however, of a duration far beyond the limits of any human experience.' But it requires no opium other than overpowering emotion charged with imagination to work similar miracles, for, as Mr Algernon Blackwood tells us in *Jimbo*: 'With every one, of course, the measurement of time depends largely upon the state of the emotions.'

Some time ago a sun-dial was found that, after all, told the truth:

Time is
Too slow for those who wait,
Too swift for those who fear,
Too long for those who grieve,
Too short for those who rejoice;
But for those who love
Time is
Eternity.

And Sir Thomas Browne, in his own sonorous voice, tells the same tale: 'Adversity stretcheth our dayes, misery makes Alcmenas nights, and time hath no wings unto it.'

What a strange mix-up the world would be were time to be measured by the mere sense we have of it, or the memory of its passing, and not by the matter-of-fact actual process of the sun! It cannot be. It is necessary to come to terms with fundamental facts, without necessarily ceasing to feel the far-off reality and charm of that elusive realm of fancy (which may, after all, contain the deeper and greater fact) into which we peer, or are fitfully drawn for the moment, and then return to live the life of common men who pay their bills punctually, buy postage-stamps and other things, and fill the hours and minutes with the prosaic and customary life of the world we live in. Indeed, it is indispensable to do so, and Anatole France gives the show and all the glory thereof away when he makes one of his characters say: 'I hold that man is only master of time, which is Life itself, when he has divided it into hours, minutes, and seconds—that is to say, parts proportioned to the brevity of human existence. And I thought to myself that Life really seems short to us only because we measure it irrationally by our own mad hopes.' Still, it must be admitted that this is a view avowedly of the earth earthy, and though 'Time's Laughing-

stocks' may be as numerous as Mr Thomas Hardy likes, and though it may be, and is, necessary to come to terms with time and retain our clocks and watches, some of us prefer to leave a little room for higher and more delicate things. We talk of 'killing time,' but it is time that kills us.

In *The Story of an African Farm* Olive Schreiner finely makes us feel how small and faint is the footpath we traverse, how narrow the shaft of light, as it were, that follows the dancer on the stage of time. These are her words: 'They say that in the world to come time is not measured out by months and years. Neither is it here. The soul's life has seasons of its own; periods not found in any calendar, times that years and months will not scan, but which are as deftly and sharply cut off from one another as the smoothly-arranged years which the earth's motion yields us. To stranger eyes these divisions are not evident; but each, looking back at the little track his consciousness illuminates, sees it cut into distinct portions, whose boundaries are the termination of mental states.'

The elasticity of time! There is no such thing. Well, time may, at least, be regarded as a flagon, limited in measure but filled with wines of limitless quality and potency which make war on each other, and make tipsy and silly the thought that there is nothing to wonder at in our ordinary association with time and space.

No one takes us quite so far, perhaps, as Cardinal Newman. For while Olive Schreiner falls back on 'They say,' Newman, in *The Dream of Gerontius*, boldly speaks (but the whole passage must be read), as it were, from the other side. He makes his 'Angel' say to the 'Soul' that is asking questions, that while men measure time by sun and moon, and the swing 'This way and that of the suspended rod,' it is not so in the immaterial world, for there intervals are measured by living thought alone, and 'grow or wane with its intensity,' and every one

Is standard of his own chronology.

ON THE SHORE.

A FITFUL wind to waken memory,
And call dead voices from the days of yore;
A sobbing sea whose everlasting spray
Bursts in vain tears along a weary shore.

A savour of the salt and tangled weed,
The melancholy of the moon's pale sleep,
And far off, where the loitering sea-birds feed,
A sudden cry of waking from the deep.

With that first breath of dawn upon the dark
Trembles the starlight, and the rose and gray
Curtains of cloud uplifting, lo, a lark
Springs from the shingle, heralding the day.

W. L. FERGUSON.

HOMEWARD-BOUND.

By Lieutenant-Commander G. RAWSON.

I.

CHRISTIAN left the hospital with mingled feelings. He was really grieved at the 'Old Man's' death, and felt he had lost a good friend, but at the same time he could not altogether repress the elation he felt on getting his first command.

He must write to the widow, and tell her everything, for she would want to know all the details, but he would not tell Olga that the 'Old Man' was dead, and that he, Christian, was now captain. He would keep that bit of news as a pleasant surprise for her.

She and the babe would be waiting on the Konig Wharf when they arrived, and how surprised she would be when she found that he was captain. She would be so pleased—and annoyed too, because he had not written to tell her! He smiled to himself as he walked along, back to the ship, where, although the captain was lying dead in hospital, the work went on as usual.

She was to load grain for Copenhagen, and as the sailing day drew near, the spirits of the crew rose. They were all Danes, and they were homeward-bound.

Christian whistled blithely to himself as the *Groner* rounded the breakwater and dipped her bows to the open sea. Eight knots! It was slow, but her bows were pointed for home, Denmark and Olga.

That evening the watch was set, and the crew settled down for the voyage. The mate had plenty of work for the few deck hands. The hatches had to be battened down, there was canvas to be repaired, and, on fine days, painting to be done, and he had only six men, with one at the wheel, and another helping in the engine-room.

For the first week the *Groner* ambled along in fine weather, and a fair wind helped her on her way. She was inclined to roll a lot at times, which caused Christian to think.

Grain in bulk is a tricky cargo, and wants watching. It was apt to shift with too much rolling, and Christian himself had personally superintended the placing and lashing of the shifting boards before the cargo came in. It was a 'liquid' cargo, and as treacherous as shifting sand, and the more they rolled, the less Christian liked it.

But he was homeward-bound, and he was young, and he was not going to let himself be worried.

When they were ten days out, the ship no longer steamed along on an even keel. She had taken a list to port—a slight list of five

degrees, but there it was, and it is not pleasant to be in a grain ship which takes a list in fine weather. It makes one wonder what she might do in bad weather. 'But let her roll,' Christian cheered himself; 'she is rolling home, and half the voyage is nearly over.'

He watched the barometer closely, and was not pleased to find that it had a tendency to fall, a slight fall, but he wanted a rise. A falling glass in mid-Atlantic in late winter is to be treated with respect, particularly if the cargo is inclined to shift. However, the young captain kept his thoughts to himself, although he did not like it. He was uneasy.

He gave orders to the chief engineer to work the coal from the starboard bunkers, and told the mate to use the starboard water-tanks. If they could straighten her up a little, while the list was still small, it might steady the grain. He also had a long conversation with the carpenter, who, after sounding the port bilges, had come to him with a worried look. It appeared he had found nine inches of water.

'However, a little daily pumping will remedy that,' said the captain, with an air of unconcern.

When the carpenter reported next morning that there were twelve inches of water down below, and the chief engineer, under a severe cross-examination, had to admit that the grain had got into the pumps and choked them, Christian, with one eye on the barometer and the other on the clinometer, really began to feel anxious. The barometer warned him of a gale, and the clinometer registered fifteen degrees of list.

Efforts were made to clear the choked pumps, and old Jens himself, and finally Christian, clambered down through the bilges, twisting and crawling, to the place where the water wearily slopped to and fro; but it was a hopeless task, for they could get nowhere near the spot. The grain had begun to 'creep,' and, swollen by the water, had effectually choked the pumps.

With the sea rising, and the list increasing, Christian found himself thinking hard. The heavy list was making matters difficult in the engine-room. Everything, coal, oil, water, grain, was sagging down to port, and the vessel began to look like a drunken reveller that could not stand up.

Christian prayed for fine weather, and could not keep his eyes off the barometer, which hung in his cabin, swinging in its gimbals. In another week, if Jens managed to keep up their speed, they would make Queenstown, where they could put in, and straighten up the cargo, and get at those pumps, and clear them.

For the present they were moving along, and if the list became no worse, all might yet be well.

But when he turned in to his bunk that night he noticed that the wind had shifted into the north-west, and the glass was still falling.

II.

He was awakened by the second mate, who reported that wind and sea were rising. Christian felt the ship labouring, and sometimes she staggered a little, when, poised on the top of a wave, she hesitated before sliding down into the valley beyond. The wind had shifted right round to the east, dead ahead, and the second mate said that the speed had fallen to six knots. All the time he was lugubriously talking, Christian had a horrid feeling that the list had increased.

He put on his oilskins and went up onto the bridge to think things over. The stinging spray cleared his brain, and he calmly analysed the situation. An impulse to lighten the labouring ship by jettisoning some of the grain crossed his mind, but it was impossible to remove a single hatch in this weather.

It was obvious that they were in for a gale, and an easterly gale at that. The list was slowly but steadily increasing; the pumps were choked, and could not be cleared; there was now eighteen inches of water down below; and the seas were discovering the weakness in her decks. He must ease the burden, but how? There was a hope that the hand pumps might keep the rising water down. At six o'clock he sent for the mate, and told him to set all hands onto the two pumps. With difficulty these were rigged, for the ship was rising late to every sea, and the green water was tumbling on board, sweeping the men off their legs. Presently one pump was ready, and four hands set to work on it, but the thin trickle they produced was ludicrously inadequate. An hour later the second pump was going, and a fireman borrowed from the engine-room made up the gang of four. Hour succeeded hour, and the two parties worked laboriously, always up to their knees in water, and sometimes swept from head to foot. Christian perceived not only that their efforts were of no avail, but that if he left them there much longer the men themselves would be lost. The seas were rising, and mountainous combers assailed the ship. In fine weather something might be done to save her, but in this cruel hell of crashing seas he felt impotent.

He laid her off about four points from wind and sea, and ordered Jens to keep the engines turning slowly, at which the old man smiled bitterly. He would have difficulty in keeping them turning at all. He, the old man, and Christian, the young captain, looked into each other's eyes without speaking. Both knew, both

realised the impending danger, but they said no word of it to each other. The men were called from the pumps, and set to get out the sea-anchor. They lashed three spars together in the form of a triangle, and laced the sail over it. Then, with a mighty heave from all hands, the contrivance fell overside, and they paid out the line, eighty fathoms of it. As the line tautened to the strain, the *Groner* lay a little easier. She seemed to respond to the nursing, and the oil with which they attempted to still the fury of the seas was taking effect. But, like a tired woman, she lay deep and heavy, and Christian perceived, with a new fear in his heart, that the list was still increasing.

Thus far, the crew had treated the gale and the list with the equanimity of seamen. It was all a part of seafaring, and most of them had weathered gales as bad as this in the old tub.

But the rising water and the increasing list could not be concealed from them, and here and there among them Christian detected signs of anxiety reflecting his own. With the approach of nightfall troubles accumulated.

A huge sea came sweeping down on the ship.

'Look out!' roared Christian.

He caught a glimpse of the cook staring out of the galley porthole with terror-stricken eyes, and the next moment cook and galley disappeared in the avalanche of water which swept across the deck.

The iron house had gone overboard, tearing a large rent in the lee-bulwarks, through which the water surged. Christian shook his fist at the hungry seas, which appeared to be advancing from all directions to overwhelm them.

Would they give no respite?

The water poured down the rents in the deck where the iron house had stood, and he reflected bitterly that, even should he be able to bring the *Groner* staggering into Queenstown harbour, the greater portion of the grain must inevitably be ruined.

He could hardly bear to look at the weather bulwarks, which groaned and shuddered under the mighty hammer-strokes of the pounding seas.

A hundred times it seemed as if the labouring vessel would be engulfed. Wall after wall of blue-green water appeared in rapid succession, and, crashing down, swept across the decks, taking the lee bulwarks with them.

Wet, cold, hungry, and miserable, the crew had mustered up on the bridge deck. Rest there was none, for the fury of the gale made repose impossible. With the galley and the cook had gone their chances of warm food and drink, but the Primus stove had been brought up from the captain's cabin, and lighted in the chart-room. The hot cocoa revived them, but the night passed slowly, and the ship, settling deeper, took on the appearance of a submerged derelict.

III.

Some hours had passed when Christian espied old Jens climbing up the ladder. He knew what the chief engineer had come to tell him, and did not want the crew to overhear. Jens, divining his purpose, followed him into the chart-room. 'We can't stay below any longer,' he said. 'The water is up to the bed-plates, and soon——' He left the sentence unfinished.

Christian felt that the old man had come to the end of his tether. The responsibility for what was happening in the engine-room was now transferred to his shoulders. He was the captain, and he must maintain control until the end, and if they were destined not to reach port, he must still retain the control, the command, his first command. 'What is the situation down there, exactly?' he said calmly to Jens. He would betray no symptoms of weakness to the older man. After all, they were still afloat, and if matters came to the worst, there were the boats. He braced himself to hear Jens's report.

'The men can't keep their feet down there,' said the chief engineer. 'The water is coming over the bed-plates, and we can't get at the bunkers. Steam has fallen to twenty pounds, and the men are dead beat.'

'Do you mean——?' Christian began.

'I mean that we must draw fires, or the water'll put them out.'

So that was it! Well, things could not well be worse.

They must try to ride out the gale with the sea-anchor, and if that failed there was still the main trysail. In the meantime, if the water continued to rise in the ship, and she found——

He brushed the thought aside. She must not founder—he would not let her. 'Call the men up,' he said to Jens.

They came up slowly, and joined the rest of the hands clustered on the bridge deck. Christian surveyed them, as they clung to the rails, grouped around him. Now that the cook was gone, there were twenty-two all told, including himself, and he watched the despondent group with dismay in his heart.

IV.

Towards dawn the ship fell off into the trough of the sea. The painter had parted, the sea-anchor gone, and the vessel fell away to leeward rapidly. As a last hope there was the main trysail which, when hoisted, might keep her up to the sea. Slowly and painfully Christian led half-a-dozen of the men aft, past the funnel, until they reached the mainmast. Here, with infinite toil, they laboured unceasingly to cast the sail adrift, and presently the frozen men tailed on to the halliards and hoisted away. The rusty gear worked protestingly, but the sail held her up to the seas.

Christian frequently found the men gazing at

him, wondering, perchance, what was passing in his mind. He was a rough, untutored seaman like themselves, and withal suffered from the handicap of youth, but now, in the time of trouble, they looked to him to bring them through. He was the 'captain,' and in that magic word they found their consolation.

Slowly in his mind was born the bitter truth that they were doomed. The incessant and increasing weight of water that crashed down upon the decks and weather bulwarks almost submerged the ship. The fore and aft well decks were well-nigh invisible, and only the fo'c'sle head and bridge showed up like islands amid the weltering chaos of water.

It was time to leave her; the two lifeboats still hung undamaged in the davits, but until the gale abated it was idle to think of even attempting to lower them. Would the seas never cease their deadly attack? Christian gazed dully through the chart-room porthole. Suddenly a dark shadow enveloped the ship. He looked up in amazement. High above him towered the white crest of an enormous wave. His eye received the impression of a gigantic wall, a tremendous upheaval of the ocean, a horrible giant, which far outstripped the big white-capped seas that so relentlessly bore down to the attack. He yelled with all his might through the open port, 'Hold on, for your lives!'

A moment of suspense followed, and then the *Groner* was blotted out from view.

V.

Possibly the wall took ten seconds in its passage over them, but to Christian it seemed an eternity. In his mind was the thought 'This is the end;' but he was mistaken. It was not the end—yet. When some minutes had elapsed, and the seething chaos of tortured water passed, leaving the vessel shuddering under the blow, Christian collected his wits and counted the scattered hands. Fourteen remained, the others——. Among those left he failed to find old Jens.

With desperation in his soul, he looked for the two boats. Only the twisted arms of the davits remained, hanging their heads as if in shame at having lost their precious charges. Rage and mortification possessed him. These devilish seas, would they never cease? His men, his boats, his ship—did they want all—that he possessed? His thoughts wandered to Denmark and Copenhagen and Olga. 'Curse you!' he cried to the oncoming seas, whose white crests seemed to taunt him with fiendish glee. 'Look out!' he cried again, but the weary men were dazed and half-senseless, and the wave tore them from their lashings, and carried three more away.

He seized the broken lashings which had failed to hold one of the men, and knotted

the ends around his body. 'Lashed to a sinking ship,' he thought to himself; and as the realisation of the impending fate of his beloved *Groner* came to him, tears came into his eyes.

Besides himself, there were now only ten men left, and most of them were half-dead with fatigue and cold. He noted that the lashings of several of them were adrift, but the men were seemingly too lifeless to readjust them. Watching his chance, he loosened his own, and swiftly bound up the others. He had to hurry, and had barely time to make himself fast to the rail again before the next comber burst upon them. When it had passed he raised his weary eyes. Ohlsen, the mate, and three others had gone.

Lack of food and sleep, and the cold, were affecting those who remained. The heads of two of them hung forward, so that their chins rested upon their chests, and one had slipped from his lashings onto his knees.

Amid the incessant roar of the hurricane and crashing of the seas, Christian's ears caught the crying of the birds overhead. There were hundreds of them, maintaining their position with difficulty, and winging hard to stem the storm. He wondered what they had come for, and now and again one or other of the birds would swoop down to the surface of the sea, pecking eagerly at some floating tit-bit.

Lashed to the rails, half-standing, half-lying, he looked down the deck which sloped steeply away to leeward. Half the ship lay under the waves, and the one mast which was left, with the tattered remnants of the sail, lay almost parallel with the sea. In his heart Christian realised that the *Groner* was going, slipping away, down, from under his feet.

So he would not see Olga and the little babe again. He wondered what they were doing now. To-day—to-day, he had lost count of the days. His mind wandered, only to be brought back to incredible misery by successive walls of water which swept down, blotting out him, the *Groner*, the world.

Overhead the birds screamed and cried, as if to warn him of the danger, but Christian heard them no longer. Cold had numbed his senses, and consciousness was slipping from him.

Suddenly a dreadful noise rose above the roar of the gale. The water had reached the boilers, and white clouds of steam poured forth, frightening away the birds. The white-crested combers roared in a deep diapason of delight, and the gale, thinking its work done, began to abate.

VI.

One morning, some two months later, on-lookers in the lobby at Lloyd's watched with curiosity the white-headed beadle posting up a notice on the board whilst the *Lutine's* bell

tolled mournfully. They crowded around the notice, and read:

Missing Vessel.

The following vessel, which has previously been referred to as overdue, is now posted as missing, viz. the *Groner* of Copenhagen (Denmark), 2056 tons gross, which left the Plate for Copenhagen on 20th February with a cargo of grain, and has not since been heard of.

In a little house in Copenhagen, Olga with her babe waited for their ship to come home.

VII.

Captain Williams, of the barque *Scottish Falls*, sat at his cabin table writing a letter to his wife.

The barque was on a voyage from Cardiff to San Francisco, and in a few days the captain hoped to cast anchor in the Golden Gate, after a tedious voyage which had now lasted one hundred and forty days.

'We had a bad gale sixty days out from Cardiff,' he wrote. 'It blew from the east with hurricane force, and we had to run for it, with reefed topsails. I never thought the *Falls* would weather it, as it was too late for us to heave-to, but on the fourth day it abated somewhat. Judge of my surprise that afternoon, when the mate reported a water-logged derelict steamer on the port bow. The sea was still high, but it was subsiding all the time, and the mate swore that through his glasses he could see two or three men on the wreck.'

'I rounded to, and waited for daylight, as, if the mate's yarn was true (and two or three of the crew corroborated him), I could not very well proceed on the voyage without investigating further.'

'In the morning it was safe enough to lower a boat, and I sent the mate off to have a look at her. They were a long time away, and when they got back alongside, I saw they had three bodies in the boat.'

'It appears from the lifebuoys that she was a Danish steamer, the *Groner*, laden with grain, and the mate said she was on the point of foundering, as her hatches were blown off; so that she would not be a danger much longer. However, I waited and watched her safely go down before proceeding. Two of the bodies were quite dead, but there seemed to be a spark of life in the third, a youngish man of about twenty-eight or thirty. We got him into a bunk, and, later on, he showed signs of reviving, and by the evening he was wide awake, though still dazed and half-conscious. He was inclined to be delirious, and threw his arms about, and kept on shaking his fist and crying out in some foreign lingo.'

'After three or four days he was sufficiently

recovered to tell me his story. It appears that he is (or was) the captain of the *Groner*, which had struck the same gale as we had met. They had a bad time of it. The seas put the fires out, they lost both their boats, and all the crew were washed away except the three we picked up.

'He has certainly been through a terrible experience, and it was his first command, too! He was tremendously excited when he found we were eleven weeks out, and bound for 'Frisco. Begged me to put in at a South American port, so that he could cable home.

I couldn't do that, but promised I would signal the Falklands, or any ship we met. However, as luck would have it, we passed the islands in a blinding snowstorm, and the only vessel we spoke was another windjammer, off Cape Horn, and, like ourselves, outward bound.

'So the first news of the *Groner* will be known when we reach 'Frisco. He is going to see the Danish consul there, and will go home overland *via* New York. He tells me he has a young wife and babe in Copenhagen.

'Poor thing! She will have long given him up for lost!'

THE SCOTTISH BAR AND ITS PLACE IN SCOTTISH LIFE.

THE offer of their great library, which the Faculty of Advocates recently made to the Scottish people, as a national library, followed by the gift of £100,000 by an Edinburgh citizen to finance the project, has brought into an unusual prominence the small body whose bewigged and gowned activity lends a dry liveliness to the old Scots Parliament House that sequesters behind St Giles' Cathedral in the High Street of Edinburgh.

With their brethren, the Writers to the Signet, the Faculty of Advocates constitutes the College of Justice presided over and ruled by the judges, all of whom are members of the Faculty of Advocates, and are technically described as senators of the College of Justice.

There is a mediæval flavour about the conception that under the presidency and control of the senators this College of Justice is studying and applying the principles of justice handed down from past generations, and adapting them to the ever changing features of modern life, or else interpreting, with an exactitude of construction that leaves the layman aghast, the intricacies of modern legislation. No case can be presented in the Supreme Courts of Scotland except by an advocate, unless it be by the litigant himself.

In some of the newer countries, as, for instance, the United States of America, there is no rigid separation of the Bar from the solicitor's branch of the legal profession. The counsel is not so aloof from his client as with us in Scotland, and similarly in England, who retain the old division. In these countries the legal practitioner is more the agent of his client, whereas with us not only is he charged with the duty of attending to the interests of his client, but also in a very real sense, as a member of the College of Justice, he has the duty of helping the Court in the administration of justice. The strength of the forces maintaining this separation of functions may, however, indicate that a very real advantage, at any rate in an old and developed community, exists

by reason of this divorce. Certain it is that a Bar composed of men of sterling honesty of character and keenness of intellect is one of the most precious of institutions a country can have.

Discipline at the Bar is of the strictest in all that pertains to professional honour; and woe betide the counsel who is false to the code which centuries of practice have laid down for the Bar. It is one of the peculiarities of the Scottish Bar that not only has it a marked eminence in the purely legal field, as its long and illustrious history shows, but it has the proud position of touching Scottish life in all its secular developments, and so avoiding the narrowness that, since Burke's day, has been recognised as the special vice of the legal profession. The community of interest and outlook that the close corporate life begets, similar to that developed in the collegiate life of the old English Universities, has resulted in a very strong corporate sense, not only in matters of professional interest but in the wider aspects of life. The spirit of quiet, unassertive scholarship is still to be found there, the same eagerness of political activity that has made the Parliament House the home alike of reaction and reform, just because each element is vigorously present in the people of whom this Bar is a microcosm; and a truer conception of the Scots tradition in literature than is to be found in the Scots emigrants to Fleet Street. It is not without its significance that the Faculty of Advocates can boast of Sir Walter Scott and Robert Louis Stevenson among its members, and that David Hume was once its librarian.

Critical literature, so far as the English language is concerned, may almost be claimed as beginning at the Scots Bar, for the primary impulse of the *Edinburgh Review* was to be found in that small coterie, headed by Jeffrey and Brougham, who made the success and fame of the original *Edinburgh Review*.

The Faculty of Advocates dates back to the foundation of the Court of Session by an Act of the Scots Parliament in 1532 as the College

of Justice, though there are records of pleaders representing their friends and dependents, as in the old Roman practice, prior to this date. At first the numbers were limited to ten, and no special qualifications were required; but by 1619 the Faculty was open to all who satisfied certain requirements as to knowledge of the civil law of Rome, tested by examination and thesis.

The head of the Faculty is the Dean, who is chosen by the vote of his brethren from among those who by seniority and acumen are counted the leaders of the profession. The highest honour which can be conferred on any counsel by his brethren is his appointment as Dean of Faculty. By virtue of his office the Dean is the leader of the Bar, and as such takes precedence of the Lord Advocate. With his council he is the disciplinary head of the profession.

Before any one—and in these days the word has no limit of sex—can be called to the Scottish Bar, he must, besides paying the fees which are due, partly to the Government in Stamp duty, partly to the Faculty, have taken a degree of a recognised university in general scholarship, the usual cultural Arts course or its equivalent, and a similar qualification in Law; or else submit himself to examination by the Faculty, which, as a university in the mediæval sense, confers the degree of Advocate. The inrant, having been duly approved by ballot, and having taken the Oath of Allegiance before one of the judges in the Outer House, is admitted to membership of the College of Justice and the Scottish Bar.

Thereafter in his new and strange array of wig and gown the aspirant after legal fame starts, with youth's hopes still high, to pace the old Scots Parliament Hall, from the walls of which the portraits of the great dead, as the jurist counts them, look down on his endeavours.

Unless the influence and interest of solicitors ease his path, the young advocate is likely to walk these courts for many briefless years while the surging hopes of youth give place to the grim determination of maturity. But the knowledge that men have proved in time the worth and ability which were denied opportunity for even so long as ten or twelve years keeps steady the heart and head of the counsel whose only influence is the faith that everything comes to him who knows how to wait.

These years of waiting have their unconscious disciplinary power, which steels and moulds the temperament to that logical detachment of view which is the core of the judicial spirit.

The legal mind in its highest form is of late development. It is youthful at forty, and functions at its best in those years verging on the allotted span, when the ordinary mind has lost its elasticity, its decision, its courage. There is, perhaps, a quaint justice in this lasting maturity of the late flowering legal mind which recoups for the long weary years of waiting and training.

The art of the great counsel is not so much as is usually thought the sleuth-like cunning that senses a way between seemingly incongruous or hostile decisions that are held to be binding. Authority in Law, the decisions which past generations of judges have made, or great writers on Jurisprudence have expounded, are indeed of vital importance. The plain citizen wants to know what the Law is, so that, guided by it, he may avoid the costly pitfalls of disobedience. To secure the orderly application and development of legal principles free of any freakish decisions of emotion is the function of authority, and gives its weight to decision and precedent. But, as Law is a living and growing science dealing with and interpreting a multiplicity of ever varying human practices, the letter of past decision has rarely more than an illustrative value; and he is the soundest lawyer who remembers the saying which crystallises the Christian revolt against the trammels of Ecclesiastical authority—The letter killeth, but the spirit giveth life. Most of the legal systems of antiquity have gone to wreck on this rock of authority, and become a meaningless farrago of formalities without any touch with realities. It was thus, perhaps, a wise provision of the old Scots Law that required the judges to be chosen from men eminent in Literature no less than in Law. Of all the practical sciences Law requires most to be kept in touch with the growing spirit of a people, which is most usually expressed in its literature, if it is to escape the danger of being engulfed in its own rules and becoming a mere jumble of artificial regulations without savour of reason.

The English Bar in the main, by reason of the greater amount of litigation which comes before the English Courts, tends to become a corps of specialists, each supremely learned in his own speciality; but in Scotland, by reason of the smaller amount of work, specialism to such an extent is unknown, and in result a broader legal view is possible to the individual counsel. There is, in addition, this distinguishing fact, that the Scots legal system is based on the Civil Law of Rome, and is thus more a code of digested principles than the congeries of often arbitrary and conflicting decisions through which an English lawyer has to make his way.

At any rate, whatever the reasons may be, whether of temperament or circumstances, the Faculty of Advocates has kept closer touch with the Scottish people as a great national institution than the more highly specialised Bar south of the Tweed.

And if its Braxfields have demonstrated the strength of its reactionary elements, its Jeffreys and Cockburns have borne witness to the courage and self-sacrifice of its reformers. It was rage at the cruel victimising of an advocate, John Muir, by the opponents of reform, who feared that even the franchise modification, which

afterwards became the first Reform Act of 1832, meant red ruin and anarchy, that inspired Robert Burns to pen the lyric which, more than anything else he has written, voices the deepest feelings and instincts of the Scottish people—'A Man's a Man for a' That.'

Not only are the judges of the Court of Session, as well as the representatives of the Law of Scotland in the House of Lords and the Judicial Committee of the Privy Council, chosen from the Scottish Bar, but the sheriffs and sheriff-substitutes, who administer justice in the lower Courts in each county, and who are in the last resort responsible for the maintenance of law and order throughout the country, are drawn prevaillingly from the Faculty of Advocates.

The Lord Advocate, assisted by his four deutes as well as the Solicitor-General for Scotland, is the Crown Prosecutor, whose duty it is to bring to the determination of the Criminal Courts every breach of the criminal law of the country, save such as are left, as being only minor offences, to the determination of the local Procurators-Fiscal in the Police Courts, with only the formal supervision of the Crown Office; for in Scotland, as opposed to England, all criminal prosecution is the duty of the State. Public justice in criminal matters is dispensed without those seemingly interminable preliminary inquiries which in England fill the press before the trial. The inquiries in Scotland are conducted in private, under the direct supervision of the advocates-depute.

It is the etiquette of Crown prosecutions that a charge shall never be pressed. Our Law is that every one is innocent until he is proved guilty, in the plain sense that he is clearly proved so to the ordinary man in the street who is called upon as juror to decide. While all the arts of advocacy are open to the counsel for the defence, the prosecuting counsel wins or loses his case by the sheer strength or weakness of the facts proved, with perhaps that element of incongruity of luck represented by the unknown factor of the quality of the jury which the accident of the ballot has given. It is an excellent safeguard of the liberties which are the traditional right of our people, and follows logically from the principle that a man's liberty is not to be taken from him until his offence is established to the satisfaction of the ordinary citizen. Herein our Law differs from codes, like the French, under which guilt is assumed after a charge is taken until the accused clears himself.

But perhaps the most noteworthy service which the Bar discharges for the community—which is not normally to be found in the Law Courts—is the barrier which it raises against fraudulent litigation. The machinery of the Courts could be used to cause innocent people all the trouble, cost, and inconvenience of clear-

ing themselves of unfounded charges were it not for the peculiar relationship which exists between the Bench and the Bar, which makes the counsel responsible to the Court for the cases he brings before it. A case based on false information is not likely to escape his trained eye, but if it does, then his duty, once this is established, is to retire from it. In result the lieges are spared a large mass of malicious litigation which uses the processes of justice for the mean purposes of blackmail.

Time has strangely changed the character of the old Scots Parliament House since the days when it was the home of Scots government, but when the Union of 1707 sped the Parliamentary representatives of the Scots people to Westminster, and the pressure of economic circumstance, together with the development of a new industrial system, made the Scots and the English in all essential respects one people, it was of especial importance in the maintenance of historic continuity that the Parliament House became the home of the Scots legal system, which was retained as one of the terms of union, and which has been maintained by the Scots people with a proud vigour, as being so completely of the essence of their national outlook that it could not be sacrificed in the wider citizenship without forfeit of that which is of the core of a people's being.

The Scottish Bar has thus become the repository of the Scots secular tradition, which it seeks to preserve, not in that literal sense which is death, but in the larger and truer sense which, while preserving its spirit, is able to graft to it the new life of another, though related, tradition, so enriching it, without sacrifice of its peculiar quality.

The judgments of the English Courts are freely quoted in the Court of Session and, where they expound rules which our Scots system can absorb without peril to its essential principles, frequently adopted. But the peculiar outlook of the Scots Law, its basic principles and high logical practical sense, are jealously preserved, with just a touch occasionally of a half-malicious, half-pitying scorn for the cruder rules and outlook of the English system. Each country has its vanities and foibles, and Scots and English have their jokes at each other's expense.

The severe business-like tone of the modern world may make it more difficult to develop in the Parliament House to-day the breezy humour which characterised the eighteenth century. But to come to these later days, and to consider only the departed, the wit of a Charles Neaves, the lucid depths of an Inglis, the firm sagacity of a Kyllachy, and the strong vital humour of an Ardwall show a variety of high mental quality which seems to demonstrate the continued vitality of the Scottish spirit in its native abode, and not merely as rich, quaint blendings in an alien mentality.

A GIPSY OF THE NORTH.

CHAPTER VIII.—LOST!

INSIDE the trading-post the terrific struggle still went forward, the three men fighting desperately for their lives without, as yet, recourse to any weapons except their naked hands. For the moment they were thrown back to the primitive, and as they rolled all over the floor, scattering such things as were in their way, they gasped and grunted, and made beast-like noises. Neither Carwyke nor Eskimo Billy was among the weaklings of the earth; but the big Russian had a giant's strength, and used it like a giant, clinging to them, keeping them on the ground as they rolled over and over, and preventing any effort to break free, whilst disregarding anything they did to him.

Then suddenly Nicholovitch gave a gasping bellow of triumph. His huge hand had found a sinewy throat, and closed on it like a vice. The throat belonged to Carwyke, who, as he felt the big hand, struggled desperately to release himself. The Russian, however, was not to be shaken off. Carwyke, with that constricting hand upon him, felt for his pistol, to find that in the struggle the belt to which the holster was attached had broken and fallen from him, leaving him weaponless. He tore at the Russian's hand, but might as well have torn at the trunk of a big pine. Black specks obscured his sight; he felt as if all the blood in his body had surged to his brain; he could not draw breath, and tried vainly to cry out.

Nicholovitch, now half-lying on his victim, looked in his blackening face and gave a ferocious laugh. Eskimo Billy, with the Russian's left arm encircling him and holding him down, heard that laugh, and divined something of what was happening. With a tremendous effort he broke free and rolled clear. For the moment the giant disregarded him, and his second hand went to Carwyke's throat.

Billy was on his feet in a second. A single glance told him the position of affairs, and assured him there was no time to lose if he was to save Carwyke's life. His eyes fell on the rifles, which had been placed in a corner when they entered the room. He leaped for the corner, picked up one of the weapons, and leaped back, with the weapon clubbed, for at such close quarters a bullet might have proved fatal to both friend and enemy. As he leaped the woman Marya entered the room and ran forward to intervene. He gave her a snarl of warning that checked her for the moment, and a second later brought the butt down on the Russian's great head. The trader gave a grunt

and turned half-over, but did not release his hold of Carwyke's throat. Ruthlessly the ex-whaler swung the rifle again, and clubbed the giant with as little compunction as he would have clubbed a seal. This time the Russian's whole form relaxed, his head fell down on Carwyke's empurpled face, he gave a groan, and then lay motionless.

In the same moment a burning pain struck through the victor's shoulder, and he swung round. The half-breed, knife in hand, was coming for him again. It was no time for niceties, and he struck her a blow which sent her reeling across the room, where she fell over one of the stools and lay still. In three seconds more he had dragged the Russian aside and was looking into his friend's face. What he saw there sent a clutch of fear to his throat, but he did not waste time. The vodka jar was on the shelf, and he half-filled a tin mug with the spirit and ran back to Carwyke.

There was bloody foam about the wanderer's mouth. Billy wiped it away with his hand, then tried to introduce a little of the potent spirit into the relaxed mouth. His first effort was not very successful. The spirit dribbled on either side, and ran down into the neck of the unconscious man's tunic. He looked hastily round for other means, and, hanging on the wall, saw a tin spoon used for cooking. In a trice he had secured it, and began to use it.

A drop at a time, he introduced something like a tablespoonful of the spirit into Carwyke's mouth; then he bathed his forehead and nostrils with the fluid. Having done that, he unfastened the senseless man's tunic and flannel shirt, and waited helplessly, uncertain what to do next.

He heard a movement behind him, and looked round. Marya had revived, and was crawling on her hands and knees towards the knife which she had dropped in her fall. She stopped as the ex-whaler rose sharply to his feet.

'So, yo' wild she-cat——' he began, broke off, and, stepping towards the knife, picked it up.

The woman, still on hands and knees, looked up at him in dumb resignation. She had intended a treacherous thing, and, in her bleak life having had no acquaintance with pity, anticipated none.

'Stand up!' said the ex-whaler sharply.

The woman obeyed him, rising shamblingly to her feet. He looked at her for a moment, saw the apathetic acceptance of tragic fate in her dark eyes, and then spoke, still with the sharp note in his voice. 'Thet man of yours

there would kill yo' if he stood in my socks jest now, wouldn't he?'

The woman's head gave assent; then Billy spoke again. 'Yep! He's thet sort, but I'm not. Yo've acted according to yo'r poor lights, as I'm goin' to act by mine. I can't trust yo', not one li'l bit, an' I haven't the heart to kill you, so I guess I'll hev to tie yo' up. Now don't move, or maybe I'll turn Russian myself.'

He looked round the room, and as he did so saw what he wanted—a long coiled thong of deer-hide hanging from a nail in the rafters. He jerked it down and swiftly bound the woman; then, having rendered her helpless, hurried back to his friend.

Carwyke still lay unconscious, but his face had a less congested look, and there was a little dilation of the nostrils which told that he breathed. With new hope surging within him, Billy picked up the tin mug and spoon, sparing a glance for Nicholovitch as he did so. The prone giant lay exactly as he had done, sprawling grotesquely on his face, arms and legs relaxed, dead or utterly unconscious—which, he could not tell, and he cared less, so long as the man remained powerless to intervene.

Billy gave his full attention to Carwyke, and again began to drop the vodka into the open mouth. Presently he saw a quiver of the bruised and swollen throat, as if there was an attempt to swallow; there came a sigh, and the eyelids trembled and lifted, and closed again.

The ex-whaler administered more vodka, and the eyes opened again, with intelligence gleaming in them. 'Lie still, Mista Carwyke! Take yo'r time. Yo'll be right in a jiffey, an' thet darned Russian is out of action.'

Carwyke turned his head slightly, and his eyes roamed round the room as though searching for something or some one, and then he strove to speak. That the effort was a painful one was clear to the watching Billy, who made haste to intervene.

'Cut ther talk out, Mista Carwyke. Thet throat of yo'r must be main sore, an' there's no need for words.'

But the other persisted, and at last achieved a weak, hoarse whisper. 'Nor—Norma?'

Billy started as if shot. 'God forgive me, I'd clean forgotten ther child!'

He jumped to his feet, and addressed a sharp question to the pinioned woman. 'Where is ther girl?'

There was a harsh menace in his voice and manner that had not been there when he addressed the woman after her attempt upon his life. Marya recognised it, and cowered a little; but in this matter she was blameless, and she spoke out. 'She go een—een canoe. Me send her away from Neek!'

'Um! Thet's all right. She went down the river, I guess!'

The woman nodded assent, and Billy turned to his companion.

'Yo' heard, Mista Carwyke. Thet poor creature there tumbled to ther Russian's game, an' sent Missy off whilst we were fightin', I s'pose. I guess we'll find her down-river as soon as we can get goin'. Better take a drop more o' this Russian physic to brace yo'.'

He lifted the other's shoulders and supported him whilst he painfully swallowed a little of the vodka; then he dragged forward a couple of sacks of flour, and arranged Carwyke against them in a reclining position. That done, he gave his attention to the prostrate Nicholovitch. He did not know whether the man lived or not, but it was as well to take no risks. The man's great frame, notwithstanding the severe clubbing he had suffered, might be capable of unusual recuperation; and if he were to revive, the trouble might begin again.

Using some of the hide-thong which had already proved useful, Billy bound the trader in such a fashion as would render him helpless if he should revive, the woman watching him with a fathomless look in her dark eyes. When he had finished he stepped to the door and looked up and down the river. But for the swirl of the water and the noise of the wind in the willows there was no sound, nor was there any one in sight. He looked towards the landing-place. One of the kayaks, he saw, was gone, but the other remained side by side with the canoes which had been there on their arrival at the post. He considered the canoes thoughtfully for a moment, then he returned indoors. Carwyke looked at him with questioning eyes.

'Ther kayak's gone,' he said, 'an' Missy couldn't hev taken it upstream. Ther current's too fast.' He paused for a moment ere he continued. 'Ther sooner we're travelling ther better. Ther chances are thet there's some other guys attached to this outfit, an' if they was to show up——' Again he paused, and after a moment added, 'Besides, there's Standifer an' his lot. I guess they'll be pushin' this way as fast as they know how, an' I ain't ready for any more scrappin'—not just now. Thet woman there jabbed me with a knife, an' while I reckon it ain't much, I'd best save what's left of me for real work. We've jest got to get to Missy as fast as the water'll take us.'

'What do you suggest, Billy?' asked Carwyke, in a voice that was little better than a hoarse whisper.

'Thet if yo' feel fit to do it yo' should tie up this shoulder of mine—there's sure to be some trade rags about; an' when thet's done we'll take one of ther canoes, an' clear out. Yo'll be able to lie about till yo'r feelin' better, Mista Carwyke. Anyway, we got to quit this

place one-time. Li'l Novgorod!' he snorted. 'Li'l 'Ell, more like!'

'Find the bandaging,' whispered Carwyke.

Billy hurried into the storeroom, and when he returned with a belt of calico his companion had raised himself onto one of the sacks, where he sat with a sick look on his face.

'You ain't feeling well, Mista Carwyka. But 'tis only what yo' might expect after lookin' over ther Divide as yo' did. Yo'll be better in a while.'

Whilst he talked he tore off a generous strip of the calico, then slipped off his outer garment, and knelt at the feet of Carwyke whilst the latter made a shift to dress it.

'It is a clean cut . . . not very deep!'

'Right-o! It ain't goin' to stop me none, anyway.' When Carwyke had finished the ex-whaler rose, gathered their rifles, and went down to the canoes. The valley still wore its deserted air, and, working quickly, he transferred their stores from the interior of the kayak to one of the canoes; then he returned to the store, helped himself to a few things that took his fancy, which he placed in the canoe, and, returning once more, found Carwyke standing at the door.

'Put yo'r arm round me, Mista Carwyke, an' I'll hold yo' up.'

Carwyke felt weaker than he had ever felt in his life. His legs shook under him and almost refused to function, while the arm that rested on the other's shoulder seemed utterly without strength; but stumblingly he made the canoe, and, with Billy's assistance, stepped into it. Then he spoke weakly. 'That woman—'

'I'm goin' to slip back an' attend to Marya. I'll loose ther strip of hide, so thet she can work herself free—after tryin' a bit; an' maybe she'll be able to doctor up her blasted Russian—if he ain't gone too far.'

For the last time he went back to the house; and when he came back to the landing-place, in one hand he carried the jar of vodka and Carwyke's broken belt, whilst with the other he stuffed something inside his Eskimo anorak—what, Carwyke could not see, and felt too sick to inquire about.

'Ther liquor may be useful,' said the ex-whaler with a laugh, as he placed it in the canoe, 'an' I guess ther Russ will hev more somewhere.'

Three minutes later the canoe was pushed out in the current and they were heading down-stream, Billy merely paddling to keep its nose straight, and to guide it from the places where broken water showed. So for a time they progressed, neither speaking; but at last the ex-whaler broke the silence. 'I hope Missy ain't run too far!'

Receiving no answer, he looked back over his shoulder, to find Carwyke was sleeping. 'Wore out,' he muttered, 'an' ain't got over thet chokin' bout yet!'

He did not waken Carwyke, but as they floated with the swift-running current he glanced from bank to bank, on the watch for any sign of the girl or her kayak. He found none, and after a time a look of anxiety came on his face and stayed there. Half-an-hour later he beached the canoe on a sand-bar, and wakened his companion to take counsel with him.

'I'm dead sure I ain't overrun ther kayak, not unless Miss Norma hev dragged it into ther bushes, an' in thet case she'd hev been on the look-out for us, sure. Where can she hev run to?'

'Farther down-stream, I expect,' answered Carwyke. 'Paddle on, Billy! We'll overtake her presently.'

'I sure hope so,' replied Billy earnestly, and pushed the canoe off the sand-bar.

Once more they swung forward in the swirl of the current, but now it was not alone the ex-whaler's face that wore a look of anxiety. There was an even deeper shadow on Roy Carwyke's, and, sick and shaken though he was, his growing apprehension began to obliterate the mere physical nausea.

'Where has the girl got to?' he asked himself, and with burning eyes he searched the river ahead without finding the answer he sought.

Mile by mile they drove on, and with every yard of the way Carwyke's fear mounted. Presently, though feeling weak as a babe, unable to remain idle under the weight of apprehension, he took a paddle and began to work. The narrow valley of Little Novgorod was well behind them now, and they were in a broader valley, bordered by fir-clad hills, in their own way as desolate as the tundra which had been the starting-point of this long journey. The banks were fairly high, and the twists and turns of the river's course hid anything of what lay ahead. As they swept round each bend, Carwyke with anxious eyes searched the new stretch of water revealed, but each time suffered bitter disappointment.

'You're sure we didn't pass her farther up, Billy?'

'Dead sure! Besides, Missy would hev hailed us if we'd run by.'

'Yes! If nothing had happened to—'

'Something's goin' to happen now,' snapped Billy sharply, as they sped round another bend. 'Look ahead, Mista Carwyke!'

Carwyke looked. The river, which had swept nearer the foothills, broke into two at the foot of a rocky bastion which clove it like a sword. Part of it swirled round the foot of the cliff and continued its way along the valley; the other, diverted by the great wedge of rock, swept into a gut of the hills.

'A forked way,' whispered Carwyke in hoarse distraction. 'In heaven's name, which way has the girl taken?'

'I reckon only Heaven knows,' said Billy

despairingly. 'Here's where ther dice are loaded against us.'

It seemed to Carwyke also as if it were so. As they made a landing and Billy went to reconnoitre, unable to remain inactive, spurred by anxiety in spite of his weakness, he stumbled to and fro upon the bank, searching the wilderness for any sign of Norma.

He found none. From somewhere down-river came the weird cry of a loon, the clack of innumerable waterfowl arose from a marsh in the low-lying land; but nowhere was there any indication of the presence of the girl, to see whom at that moment he would have given all that he possessed. His anxiety mounted to anguish. The sombre pines seemed to frown on him from the hills. The hills themselves had a grim aspect, as if they were hostile to his quest. The river swirling by, rippling in the morning sunlight, seemed to mock his apprehension; and suddenly he visioned the girl, lost and alone in this vast wilderness of the north, wandering along its intricate waterways, until, overcome by solitude, reason was unthroned; or perishing miserably of starvation in the shadowy woods.

'God!' he whispered in agony; 'God, be good to her!'

Billy appeared suddenly round the huddle of rocks at the point where the left branch of the river swung into the hills. Carwyke watched him anxiously, hopefully. But as the ex-whaler drew nearer, his face told him that he brought no good tidings.

'Never a glimpse of Missy,' announced Billy. 'Ther river thet way seems to run right into ther heart of ther hills, an' which way Missy took, Heaven knows. S'pose we try a rifle-shot or two? If she's anywhere down ther valley she may hear an' answer.'

'Yes, yes! Quick.'

The ex-whaler took one of the rifles from the canoe, and fired three shots in quick succession. As the sound of them split the stillness of the valley and echoed from the hills, a great flock of geese rose from the marsh and whirled honking into the air.

The two men listened eagerly, but heard no answering shots.

'Try again, Billy.'

Three more shots were fired, and as the reverberation of them died away, and the silence of the wilderness once more reigned, the ex-whaler spoke with a note of despair in his voice. 'No good! She ain't nowhere down there or she'd hev heard, Mista Carwyke. I reckon there's nothing for it but to explore ther way down there.'

He pointed to the narrower way between the hills, and Carwyke stared at it with hopeless eyes. Then a quick thought shot in his mind.

'You don't think that woman at the post was lying, Billy?'

'Nope! When we was there before ther trouble began I was watchin' her, an' I'll lay a dollar that she was'n't no way anxious to keep Missy hangin' around. She didn't trust ther Russian. Besides, ther kayak was gone.'

Carwyke remembered his own conviction of Marya's jealousy of Norma, and nodded gloomily.

'You're right, Billy. But where's the kayak now?'

'We've got to find thet out—an' dam soon! I reckon we'd best tackle thet arm of the river.' He pointed to the left fork as he spoke, and Carwyke gave assent by stumbling towards the canoe. They re-launched it, and drove it past the jutting bastion into the narrower stream. For some twenty minutes they swept on, then Billy cried a warning and directed the frail craft's nose inshore. Ahead lay a long rapid where the water boiled and leaped among impassable rocks. Landing again, they stumbled along the bank to investigate; and suddenly Billy, who was leading, turned and gripped his companion's arm, and gave a hoarse inarticulate cry.

'What——?'

Billy pointed silently towards a place where the water roared and foamed between rounded rocks. There a great pine, blown down by some wild storm, and drifting down the river, had become wedged, and now lifted its dead, bleached arms. On one of them something white gleamed in the sunlight. Carwyke stared at it for a moment without realising what it was. Then the ex-whaler cried in a shaking voice, 'It's ther kayak! God help poor Missy!'

Overwhelming in its impact, realisation came to Carwyke. That white thing, gleaming in the spray and sunshine, was indeed the kayak with a great rent torn in its side.

(Continued on page 174.)

'REFLECTED GLORY.'

DAD says I'm like his mother—
Her picture's on the wall;
Mum says I'm like her brother,
Which I don't see at all.
How could the little girl that's me
Be like a man as big as he?

Aunt Agnes says I am a Brown,
Because I have their features;
Aunt Mary casts her eyelids down
And murmurs, 'Like those creatures!
The child is not of common delf—
She's a De Berry, like myself.'

When mummy's visitors appear
They all at once exclaim:
'The child's your very image, dear;
Her colouring's the same,
But nurse's mirror on the shelf
Tells me I am most like myself.'

ANNE MACDONALD.

Chambers's Journal

SEVENTH SERIES

HORSES, WHITE AND RED.

By W. A. ATKINSON.

UP and down the country, on the slopes of prominent hills and ridges, there are various figures of gigantic size cut in the turf, which form striking landmarks often visible for many miles across the lower levels. Most of these cuttings represent the forms of horses, and many of them occur in the chalk districts, where the removal of a few inches of soil lays bare the white rock, and gives a silhouette of gleaming white in sharp contrast to the surrounding green, brown, or dun. But in less favourable districts the mere removal of the turf does not produce this striking contrast, and the huge intaglio has to be coated with lime, or paved with white stones, in order to obtain the desired effect. In one instance, that of the horse on Edgehill, the exposed rock was red, and the figure acquired the name of the Red Horse.

The oldest and the most famous of these white horses is the one on the hill above Uffington, in Berkshire, which gives its name to the Vale of the White Horse, along which the line of the Great Western Railway runs to Bristol. Its age is unknown. Some writers associate it with the battle of Ashdown, fought between King Alfred and the Danes in the neighbourhood of Compton Beauchamp in 871. They base their arguments chiefly upon the association of King Alfred with the district, and upon the fact that a white horse seems to have been a favourite symbol of the Anglo-Saxons, and was probably depicted on their banners. The white horse at Uffington may, however, date from a time much earlier than the days of King Alfred. It bears some resemblance to the figures of a horse which are found upon the earliest coins of the British. These coins were remote and very imperfect copies of the gold stater of Philip II. of Macedon, and were first coined in Britain from 200 B.C. to 150 B.C. Moreover, in the vicinity of this white horse there are several interesting remains of very ancient date. Uffington 'Castle,' near at hand, is a fine, oval earthwork. Wayland Smith's Cave, familiar to readers of Scott's *Kenilworth*, is what remains of a long barrow of the Neolithic period. An old road, known by the names of Icknield Street and Ridge Way, winds round the slope

of the hills upon which the white horse is cut. This road is mentioned in a charter of a thousand years ago, and was probably in existence before the coming of the Romans.

Whether the Berkshire white horse may or may not claim an antiquity so great as that of the objects by which it is surrounded, it is certainly very old. It represents a galloping horse. The turf is cut away to a depth of 2 or 3 feet, and the chalk of the high downs is exposed. The figure is 374 feet long, and covers nearly an acre of ground. When well lighted by the declining sun, it is visible for a distance of 14 or 15 miles, the hill being the highest in the district, and about 850 feet above sea-level. From time to time the figure needs to be raked and cleared of weeds, and this operation was at one time performed at an annual festival known as the 'Scouring of the Horse.' Lysons states that there was a tradition that some of the neighbouring lands were held by the tenure of cleaning the horse.

The cleaning of the former red horse of Edgehill is said to have been secured by a similar tenure. This horse was cut upon the escarpment of Edgehill, above the village of Tysoe, a few miles south of Kington, and gave its name to the vale at the foot of the ridge, the rock or soil which was exposed being red. It is said to have been cut by the country-people to commemorate that Earl of Warwick who, before the battle of Towton in 1461, killed his horse, and risked his life on foot, determined to win or die with his men. The scouring of this horse, which was in every way inferior to the Uffington white horse, was usually carried out in bygone times on Palm Sunday, the festival upon which the battle was fought. The battle of Edgehill, the first in the Civil War, was fought within sight of the red horse in 1642.

II.

In the county of Wiltshire there are several white horses. Only one of them, however, that on Bratton Down, overlooking Westbury, is old, and even this has been re-cut. Like the one in Berkshire, it is believed to have associations with King Alfred, and to mark the site of his decisive victory over the Danes at Ethandun or Edington. A camp immediately above it, known

as Bratton Castle, has been thought to be Danish, and there are other ancient camps and similar remains in the vicinity. The horse is a very shapely one, standing in an easy, natural attitude, and bearing considerable resemblance to the white horse on the Hambleton Hills in Yorkshire. The figure is cut down to the chalk, and stands out well from its background.

At Marlborough is one of the modern white horses of Wiltshire. It was cut by school-boys in the grassy slopes above the town. At Cherhill, a mile or two east of Calne, there is another of these figures. This was cut towards the end of the eighteenth century at the expense of a resident of Calne, Dr Christopher Alsop. On the summit of the hill there is a camp known as Oldbury Castle. Other white horses in Wiltshire are at Pewsey, Broad Hinton, and Wootton Bassett.

The white horse of Kilburn, near Coxwold, in Yorkshire, stands on the western slopes of the Hambleton Hills, just under the flat edge of the tableland, which here falls rapidly to the great plain which stretches away to York. On a clear day the figure can be seen for nearly 20 miles. It was made so recently as November 1857 by a native of Kilburn, named Thomas Taylor, who is said to have made a fortune in London. It seems to have originated in the whim of its designer; though there is a tradition that it was made to commemorate a horse-trainer, who was supposed to have been carried over a precipice by the horse he was riding. This is probably the result of confusion with the White Mare Crag, or Whitestone Cliff, a mile or two away, where the accident is said to have happened. The figure measures 108 yards in length, 86 yards in height, and covers an area of 3 roods. If it were enclosed in an oblong fence, the enclosed area would be about 2 acres. The underlying soil or rock in this district is not chalk, and the figure had to be made white by means of lime, of which 6 tons were used. Thirty-three men were at work upon the horse upon the day when the finishing touches were applied. In 1896 the figure was nearly obliterated by a hailstorm, which washed out the lime.

In the north-eastern part of Aberdeenshire, near to Strichen, is Mormond Hill, an isolated ridge of no great length, rising to a height of about 800 feet. On the south-western slopes of this hill a white horse is cut, which covers half an acre of ground, and which, owing to the flatness of the surrounding district, may be seen for a great distance. The silhouette is filled in with white stones. The origin of this figure is unknown to the writer; but it probably belongs to the early years of last century, as it is mentioned seventy or eighty years ago. On the other side of Mormond Hill there is a larger figure of a stag made in a similar way. This, however, dates only from 1870.

On the downs at Osmington, near to Weymouth, there is a large figure of a man on horseback, which is visible for many miles at sea. This is a portrait of George III., who had a high opinion of Weymouth as a health-resort, and spent much of his time there. The figure was cut by a soldier, and he succeeded in hitting off the characteristic form and attitude of the monarch, even if he failed to produce a very artistic result. A bed of chalk, which breaks into the cliffs at this point, forms the base of the design.

In the same county, Dorset, on Trendle Hill, near Cerne Abbas, there is the gigantic figure of a man cut out of the turf in the same manner as the horses already referred to. The figure is 180 feet tall. Its arms are extended, and it holds a club in one hand. The foundation is chalk, and, like the various horses, the figure is scoured and trimmed from time to time. It appears to have considerable antiquity, since it is referred to a hundred years or more ago, and even at that time there seemed to be no certain information respecting its origin. A somewhat similar figure is the Long Man of Wilmington, cut in the chalk downs of Sussex not far from Eastbourne. The man is represented with outstretched arms, grasping in his hands the tops of two staves, as tall as himself, with which he seems to be walking. In this instance the figure, which is 230 feet long, is only an outline and not a silhouette. Nothing seems to be known about its origin; but it is surmised that it may possibly be prehistoric, and date from the Bronze Age. About 1870, being nearly obliterated, it was re-marked with white bricks, under the superintendence of the Rev. W. St Croix, vicar of Glynde.

III.

While the majority of these landscape sculptures represent the forms of animals and men, there are occasional instances of the representation of inanimate objects or geometrical designs. One of these is Whiteleaf or Whiteley Cross in Buckinghamshire, near to Monks Risborough. It is cut on the western side of a high chalk-hill of the Chilterns, and faces towards Oxfordshire. The cross itself is 80 feet in height and the same in breadth, but it is attached to a large triangular base, which makes it a much more conspicuous object at a distance. The cross-bar is about 12 feet in breadth or thickness, and the cutting through the superficial soil is 2 or 3 feet deep. The age of the cross is unknown, but it has been thought to commemorate a victory of the Saxons over the Danes. A writer who saw it about the year 1740 says that there were at that time some remains of a fortification at Princes Risborough, which, he thought, might be Saxon, and he assigned the cross to the time of Edward the Elder, son of King Alfred.

Some later antiquaries are disposed to put back its origin to still earlier times. Though the cross as a Christian symbol implies the previous introduction of Christianity, these writers consider that in this instance it is but the modification of an older pagan symbol cut by some pre-Roman occupiers of the land.

There is a similar cross, but without the triangular base, at Bledlow, a little to the south-west. This cross is about 70 feet in height and breadth. The Icknield Way or Street, already mentioned in connection with the Uffington horse, runs along the foot of the chalk escarpment upon which these crosses are cut. This particular Icknield Way—there are many bearing this name—is here in several respects unlike a Roman highway, and Dr Guest and other antiquaries regarded it as a British track-way.

These various cuttings on the hillsides, which rarely fail to excite the wonder or the interest of casual beholders, may have in many cases

something more than a popular interest. They divide themselves into two classes: those, like the horse at Kilburn and the stag on Mormond Hill, which are modern and freakish; and those, like Alfred's horse at Uffington and the Long Man of Wilmington, which are undoubtedly old, and may have a historic significance. The latter occur for the most part on the high downs of Wiltshire, Berkshire, Dorset, Sussex, and other southern counties, where prehistoric remains, testifying to large and flourishing settlements, are numerous. It may be said that these turf sculptures are numerous upon the downs because the underlying chalk affords the best foundation for the purpose; but this does not explain the frequent association of the landscape carvings with prehistoric remains of a totally different kind, nor does it explain the predominance of the horse, which may have some significance. Modern opinion, in spite of the lack of conclusive evidence, seems inclined to assign to some of these figures a very high antiquity.

THE WHITE HERD.

PART II.

V.

I TOOK my leave, and cycled back to the cottage on the hill. Kelly was waiting for me on the doorstep.

'He's still aslape, sor,' he announced in a mysterious whisper. 'He's been sore hurt. No fall from a harse iver made such a wale on the face of anny man, Misther Dean.'

'It didn't,' I confided. 'Do the people hereabouts say anything regarding—regarding this Mr Bolding?'

'They do that, sor, even although he hasn't been here above a week. They are sayin', sor, that he isn't Misther Rupert Bolding at all, at all. There's some as remembers Misther Rupert as a gossoon, and they say as he was brown, while this man's black as the side o' Partry Knock.'

'We must be circumspect,' I admonished. 'We may be doing him a grave injustice.'

'Misther Dean, sor,' he said, with the queer lighting up of the eye which I had come to regard as characteristic of the region, 'the Joyce's Country people are circumspect enough, but they've their own manner uv bein' so, if ye understand. The gentleman in there—he made a motion of his head towards the bedroom—'had better mind his pays and q's. There's a great warmth for the Bouldings here. It's manny a long year since they came to the castel, and now there's but Miss Helga left—a sthrappin' colleen, but a grim.'

'Indeed, she is,' I assented hastily.

'Sure ut'll be more than a clip wi' Miss Helga's whip he'll get ere he's done,' mused Kelly. 'There's a sore thrial waitin' him. If he's a true Bolding, he'll not be feart o' the White Herd. If he isn't, the thafe o' the world——'

'I don't grasp your meaning, Kelly.'

'It's like this, sor,' he explained, the light behind his sombre eyes growing in intensity. 'The tale runs, and has run for ginerations, that the bastes in the White Herd can tell a true Bolding, and will not harm him. Ould Misther Boulding, Miss Helga's father that was, would walk in among thim like a herd among ornary cattle; and it's Miss Helga as feeds thim out'n her own hand, when no man for twenty miles round dares go within as many yards o' thim.'

'Good gracious!' I exclaimed; 'do you really mean to say—to suggest that they'll expect that man in there, whoever he may be, to face—to go among those dreadful beasts?'

'There'll be murmurin' if he darsent,' he replied darkly. 'It's the way of Joyce's Country.'

'A nice way, too!' I hadn't quite realised that the man was talking seriously. 'Was any one ever unable to face this—this sore trial, as you call it?'

'Ould stories say so.' He groped about in his mind. 'Ginerations agone, they say, there came such a man as this might be to Boulding Castel.'

'There did?'

'Yes, indade, sor. The people misdoubted him. He was put to the thrial.'

'And—he failed?'

'Sure, yes, he failed. How did yer 'anner know?'

I shuddered. The shadow of Partry seemed very dark. The west wind came in from the sea with a wail in it. Clouds were massing over Castle Bolding. Above the wind I could hear the bellows of the White Herd. . . .

'So runs the tale,' said Kelly in a tone of grim satisfaction. 'Maybe it's an ould wife's tale. Who can say? Only the people in these parts believe it. That may make it bad for him—in there.' Once more he nodded in the direction of the house.

'I had better look at him,' I said, and went within.

VI.

He was awake and sitting up in bed. He greeted me with a sour look.

'I've been to Castle Bolding,' I said. 'I may as well tell you that reports of you there aren't very favourable.'

'Oh, indeed!' he jeered. 'My affectionate cousin, I suppose? Well, I'll see to it that she won't find a home for her petty dislikes under my roof much longer.'

'I should advise you to be careful. Suspicions of your *bona fides* have been aroused.'

'Suspicions, hey?' He laughed unpleasantly. 'What sort of suspicions, my good Dean?'

'That you are not the man you represent yourself to be.'

He threw back his head and roared with laughter. Then a spasm of pain crossed his face, and he sank upon the pillows. 'Well, I'm hanged!' he growled amusedly. 'Really, Dean, what have you done with your sense of humour—if you ever had any?'

'You'll require all you've got of your own if you stay long in these parts, my friend,' I retorted.

'Of course papers go for nothing—identity papers and such proofs,' he snarled.

'They will probably only deepen suspicion,' I said, watching him closely, 'since both of your ears—'

'Well, what about them? Don't be so devilish mysterious.'

'Are entire. One of Rupert Bolding's ears was hacked about by a dacoit knife.'

A gray shadow seemed to cross his face, but he pulled himself together with what, for his damaged condition, seemed marvellous address. 'Are you trying to live a shilling shocker, Dean?' he asked coolly. 'Really, you are the most remarkably credulous—'

'The shocking process won't be felt by me,' I assured him. 'You don't seem to know the people here as well as a Bolding should. In

vulgar parlance, they'll put you through it, my friend.'

'Oh, ease up,' he snapped. 'I'm feeling better now, and I'll rid you of my company.'

'If you ever took well-meant advice,' I said earnestly, 'you'll do it now, and leave Bolding—at once.'

'What's all this mystery?' There was no banter in his voice now. 'They're queer people here, that's evident. I haven't been here for eighteen years, and then only once. But—'

'I've done my best to warn you,' I said. 'My conscience is clear. You know best yourself whether you can afford to take risks.'

He made no reply, but jumped from the bed and began to make his toilet. He was whistling bravely, but I noticed that he swayed dangerously.

'You can't walk to Castle Bolding in that condition,' I protested.

'Can't I?' he retorted. 'If you'd staggered through miles of jungle as I've done with fever on you—'

I left the room. Ten minutes later I heard his footsteps on the flags, and saw him leave the cottage and swing down the hill. Apparently he was his own man again.

About ten o'clock Kelly knocked at the door of the sitting-room where I sat smoking. 'Mr Dean, sor,' he said in his grave, deliberate way, 'I should loike to say something.'

'By all means, Kelly. Fire away.'

'Sure the countryside's ringin' with it—that that—gentleman tried to keep Miss Helga from goin' to the 'torney's—tried to kiss her. The people are fair wild.'

'Well?'

'Their blood's up. It's slow blood, sor, but when it's on foire—'

'And what do you suggest?'

'Sure, I don't know rightly, yer 'anner. The keepers an' herds are talkin' down at the inn. I don't like their demaneour at all. There's black work on hand, as I'm a Christian man, Mr Dean.'

'I'm sure you are, Kelly. You did quite right to tell me.'

I looked out of the window. Late as it was, I noticed that more than one light burned in the tower of Castle Bolding. What was happening there? How did Helga Bolding fare? I will not deny that she attracted me as no woman had ever done before, but in some strange and unusual manner that I could not fathom. And the phrase of Kelly kept running in my head, 'a sthrappin' colleen, but a grim.' Grim—yes, if the word could possibly apply to a beautiful young woman, it certainly applied to her. Grim she was in spirit, if not in face. I had no fear that she would be unable to protect herself against the man who called himself Rupert Bolding.

VII.

I was awakened by a loud knocking at my door. I cannot explain it, but as I opened my eyes and leapt out of bed at the summons I experienced some such feeling of foreboding, of the nearness of doom, as, I have heard, is felt by those who are about to be present at an execution.

'Miss Helga, sor.' It was Kelly's voice. 'She's waitin' on ye outside.'

I scrambled into my clothes. She was standing at the door. The dawn was just breaking, and its first red glow struck full upon the masses of her bright, yellow hair and the foam-flecked muzzle of the black horse she had spurred up-hill. Blood and haste, I thought, and shrank from the sight of her rather than from the keen thrust of the morning wind.

'You must come,' she said. 'They have him.'

'They——?' I was dazed, incoherent.

'They have rounded up the White Herd. They are taking him——'

'Murderers!' I shouted, beside myself. 'D—d murderers! It is horrible. You acquiesce in their abominable superstitions, you——'

'Perhaps.' She smiled harshly. 'I would not be otherwise. I am a woman of my country-side. That man killed my cousin. I searched his effects last night and found his papers. His name is John Gregory. I came to tell you—to justify myself.'

'Justify yourself!' This diabolical corner of barbarism and its chieftainess! 'Ride on. I'll cycle down. I'll be there in a few minutes.'

As I passed through the great gates I saw that which turned my blood to water. The rising sun blazed scarlet on a great concourse of snow-white cattle, whose gleaming shapes rose and fell as they galloped in a wide circle like the waves of a wind-lashed sea. On the castle steps stood a knot of dark-faced men armed with guns—the herds and keepers on the estate—and in the midst of them was the man who called himself Rupert Bolding. I rode straight up to them and dismounted. As I did so I noticed that Helga Bolding stood on a higher step, looking down on the group beneath her as one might look on at a play. The men were silent. Some of them, I could see, were in liquor. They glowered at me like hounds at the huntsman when he stands between them and their quarry.

'So you've come?' Bolding asked in his bantering way. 'In time for the funeral, eh?'

'You're makin' your own funeral,' said one of the men soberly. 'If you're a Boulding, you've naught to fear. If you aren't, well, go while you've a whole skin.'

'Cursed if I repeat that I'm a Bolding,' he cried fiercely. 'Do you think I'm afraid of a park of skittish bulls? I've faced up a herd of wild elephants, I tell you, a band of howling dacoits, and you talk of—cows!'

'You're mad!' I cried. 'If you're what you represent yourself to be, go now, and you can substantiate it later. But go!'

'Go, be hanged!' he retorted savagely. 'Why on earth should I go? It's nothing to me that you're making a ridiculous mistake. You've got it into your silly heads, you and Helga, that I'm not Rupert Bolding, and, of course, by sticking to that on some flimsy pretext you place yourselves on a level with these dolts here.'

'But can't you see,' I implored—'can't you see that it's got past that? Even if you are Rupert Bolding, as you maintain, and we admitted it, these men here are determined——'

'That's just the part of it I relish.' He laughed recklessly. 'Oh, I know you regard me as a brute because I threatened dear Cousin Helga here. Well, perhaps I am. The wild, you see, caught me young, and I have become a man of the wild. You think this place primitive. Good Lord, had you been where I have been! It's farcical! As for this *canaille*, do you think I'm afraid of them, or of their silly test? Why, man, it's a bagatelle. A parcel of half-tame cattle!'

'Ye laugh at the Herd,' flashed out one of the men. 'There's scarce a man in the whole of Joyce's Country will go within a quarter of a mile of them.'

'So much the worse for you, then, as a pack of skunks. Come on, you fools! I'll show you what a real man's like.'

'Bolding!' I cried, my nerves strung to breaking pitch.

'Yes, Dean? I see you're calling me by my proper name now.'

'Gentlemen!' I appealed to the keepers. 'Miss Helga doesn't wish this to go on.'

She was silent—frozen.

'Miss Bolding,' I almost cringed before her, 'you must see——'

She was staring hard at the man who called himself her cousin.

'If he is what he claims to be,' she said, as evenly as though she were speaking of some one a thousand miles away, 'he is in no danger. If he is not—then he deserves all.'

'But you say that you have proofs that he is not.'

She made no reply.

'I won't stay here and see murder done.' My blood was up now. 'You are savages, barbarians, every one of you.—You, woman, are the worst of all.'

She looked past me with unseeing eyes. I turned away.

'Come, let's be going,' said the claimant

briskly. 'It looks like rain. That'll spoil the sport.'

'Bolding, you madman!' I stood in his way. He brushed past me. I was elbowed aside by a press of jostling, shouting men. They were all mad that morning, they by virtue of their insane superstition, he by virtue of his evil pride and scorn of danger.

'Watch he doesn't run for it, bhoys,' cried a keeper.

'Run!' sneered Bolding; 'I wouldn't run for the devil himself, you fool. Come along, fellow-savages; and you, Sir Civilised, you can watch us from the window if you've got cold feet.'

(Continued on page 184.)

CROCODILE SHOOTING IN INDIA.

By Major R. OAKDEN.

IN September of 1918 the regiment in which I was serving was sent out from Egypt to India. Our first station was at Fyzabad close to a large river, the Gogra, a tributary of the Ganges. There were several jeels in the neighbourhood where duck and snipe were plentiful, but the sport which appealed to most of us, as being of a character we were not likely to experience again, was shooting the crocodiles which abounded in the Gogra.

It would not have been a difficult matter to shoot these from a boat while they were swimming in the river, but there would have been little satisfaction in this, for a successful shot would only result in the corpse sinking to the bottom. The crocodiles had, however, a habit of crawling on to the shores of the river to sun themselves, and it was then that our opportunities occurred of shooting them, either from a boat or after stalking them from the banks.

This was not so easy as it would appear, for the crocodiles of the Gogra, though fearless enough in the water, had been taught by many generations of British officers to be very wary while out of their element. Moreover, though their bulk is large, the vital spot—the place where the head joins the body—is very small, and unless killed outright they manage to wriggle into the water and so put an end to the prospect of securing a trophy. A long-range shot gave little prospect of killing outright, while, both banks and river being destitute of cover, there was considerable difficulty in getting within reasonable range without being detected by the sharp eyes of the crocodile, which would quickly scurry into the friendly shelter of the water.

Their vitality is enormous. On one occasion I was out with a fellow-officer named Williams and two boatmen. After I had shot one small crocodile we decided to divide our forces, he going along the bank with one boatman, while I floated down the river with the other. Having discovered three large crocodiles lying up on a long flat island, I landed at the farthest end, and crawled towards them. When I had got within about a hundred yards of the party, one of them became suspicious and began to move. I knew

that it was useless to attempt to get nearer, so, taking careful aim, fired at the largest. He gave one convulsive movement and fell back, while the others, of course, quickly disappeared into the water.

I went to my victim and, having planted another shot into him at close quarters, measured him, and found him 15 feet 6 inches long. I signed to the boatman to assist me in turning him over so that we could remove the belly skin, which is the part used for making bags and other articles, the remainder being too thick and horny for any practical purpose.

The boatman took hold of one of the hind-legs gingerly, but immediately he did so the leg began to move, and he let it go as he would a hot poker. I planted two more shots into the crocodile, but on further attempts to turn him over the leg still continued its spasmodic movements. Doubtless he was really dead, but my boatman was clearly nervous of touching him, and even had I been quite free from the same feeling—which I was not—the bulk of the crocodile would have been too much for my unaided efforts.

I therefore sent the man away with the boat to fetch our comrades, and after a time he returned with Williams and the other boatman. In response to our directions, the two men approached and touched the hind-leg. The result was as before.

'Put a shot through his heart,' said Williams.

As neither Williams nor I had any idea where the beast kept his heart, this was not very helpful advice, but I put two more shots into his body with the vague idea of hitting the important member. Whether I succeeded or not it had no effect on the unruly leg.

I then refused to waste any more cartridges, and catching hold of the still moving leg, succeeded with the aid of the rest of the party in turning the brute over. We then commenced to remove the belly skin, starting at the throat, but when we got near the hind-leg he began to kick again. I had to stand on the offending limb until the operation was completed.

While this was going on the vultures began to arrive. First one, then three or four, then a whole crowd. How so many arrive out of the

due is extraordinary. I once counted seventy, and then gave it up as hopeless.

When the belly skin had been removed we threw it to the vultures, who pounced upon it, fighting and struggling, but effectually cleaning it of such scraps of meat as had adhered to it. When I had first seen this done I had thought that the birds would ruin the skin, but in reality it is too tough even for their sharp beaks.

On another occasion I went out with a shikari and two boatmen. After patrolling the river unsuccessfully we landed to investigate some pools where a *burra mugger* was reported. We saw nothing of him, but I managed to get a few duck and plover with my shot-gun. It was then April, and I had been out since 4.30 A.M. I decided to return before the heat of the day was at its worst, so about 10 A.M. we entered the boat to go to quarters.

We had not been long in the boat when the shikari called out to me, 'Look—big mugger—shoot.' I looked, and could just see the eyes and tip of the snout of a garyal, or long-nosed crocodile, lying close to an island. I was surprised that the shikari should have suggested shooting a crocodile in the water, but I had confidence in the man, and, taking aim at where I judged the vital portions to be, fired.

The result was utterly unlike anything I had ever seen before. The crocodile raised the whole length of his body out of the water, turned a complete somersault, and came back onto the water with a resounding splash. These wild gyrations continued. He had been lying in an area of shallows, and, being wounded, was trying to follow his natural instinct and dive into deep water. Had the boatmen kept still it is just possible I might have hit him with a second shot, but they rowed vigorously towards him, and, though I fired several times, to hit a revolving crocodile from a rocking boat would have taxed the skill of a Colonel Cody.

After a few minutes he managed to get into slightly deeper water and disappeared, but shortly afterwards got into the shallows again, and the wild gymnastics recommenced. At length he sank into the main stream, and I mentally bade him good-bye.

But I was mistaken, for he reappeared, swimming calmly. I was about to fire, but the shikari restrained me. Instead, the boat was rowed up to him, and to my surprise the shikari took a piece of rope, made a running noose, and slipped it round the jaws of the crocodile.

The result was a wild dive, and the rope, which was of crude native manufacture, broke in his hands. I thought the game was hopeless, but my companions seemed determined not to relinquish the chase, and waited patiently for his reappearance. After about ten minutes we again saw him swimming with the noose round his jaws.

We rowed up to him, and I seized the rope, but this time the noose itself broke. I handed it back to the shikari, signing to him that we should make it double thickness. He did, and we made another attempt, but the noose was too short and clumsy, and the crocodile dived again before he could get it fixed.

I saw that what we wanted was a long length of rope, so that we could play him as one would a fish. All we had was a length of twine which was sometimes used for towing the boat.

This we attached to the rope, and waited patiently for another opportunity. Again he appeared, and was successfully noosed. This time the shikari made no attempt to hold him, but allowed the twine to run through his fingers, while we rowed after him to prevent his taking out the full length of the twine. Of course, it was quite hopeless to think of pulling him ashore, even if we had had a rope strong enough to hold him, unless I could shoot and kill him while on the noose. Even then I doubted if the twine would be strong enough to hold his weight, and therefore waited patiently until we had drawn up to him, and the shikari had the rope in his hands. I had loaded my shot-gun with two 'lethal' cartridges. These were each fitted with a hollow spherical bullet, which I judged to be more effective at close quarters than a rifle bullet. I waited until the shikari had the rope in his hands, and was just on the point of firing, when he dived again and the rope broke.

'Canst thou draw out leviathan with a hook?' we are asked in the Book of Job. Really we seemed to be attempting something equally hopeless. It was now about midday, and the heat was intense, but my companions showed no sign of tiring of the game, and I decided to make a final effort. Again the crocodile reappeared and was noosed. Again he was allowed to run, and we rowed after him, but this time we got the boat close up to him and I fired. He sank, an inert mass. Slowly, and with much trepidation, we towed him across the river, and drew him up the bank. The post-mortem showed that my first shot had blinded him, which doubtless explained a good deal of his behaviour.

THE CLAIMANT.

ON such a night, when infinitely vast

The skies unfold the earth's dark silhouette

And the moon's splendour over all is cast,

My soul cries out, caught in that silver net—

Imprisoned and innately human still,

Though listening to the message of a star

That shines, a beacon, o'er the distant hill

Beyond the valley where deep shadows are.

Dear God! on such a night, a night like this,

'Twere surely almost insolent to pray

For the fulfilment of some dream of bliss

Or for the puny, sordid needs of day;

Yet, conscious of its right divine to be,

The soul insistent claims its empery!

CONSTANCE FARMAR.

THE STRANGE LADY.

By ALAN SULLIVAN, Author of *Man's Work*, &c.

I.

THE canoe crept delicately upstream like a vagrant leaf, whose brown, impalpable weight only skimmed the flat surface of the foam-flecked water. Now stopping, now swerving questingly into untroubled pools, now thrusting out till the swift current thrilled against her bows, she worked steadfastly toward a cleft in the pine-topped ridge that lay directly athwart her course. From this cleft the hollow grumble of a rapid boomed incessantly. Presently, on rounding a point, the barricade of white water flashed in sunlit brilliance.

'If m'sieu will cast in front by the big rock,' said an amiable voice. At the same moment the canoe, poising for an instant, slid shoreward and fetched up in a patch of drifting foam. The paddle blade of Alphonse had not left the water, and now winnowed softly like the tail of a gigantic fish.

Past the great rock moved sluggishly a dark arm of the river. It was agitated with wayward whirlpools that rolled foamlessly out of sight, then swung to the surface and expanded into large, smooth wrinkles. The wrinkles twisted, overlapped, broke, reunited, and disappeared. Through their thin, reiterant hissing a sharp plunge sounded thirty feet ahead.

The brown wrist of Alphonse turned swiftly. The canoe shot ahead and lay inert just outside and abreast of the smooth rings that began to spread so rapidly. Then a yellow rod swayed in the bow like a streak of pale flame, a gossamer thread floated lightly outward, and two flies, hovering for an instant, dropped delicately in the centre of those watery circles.

In another second something stirred beneath the surface, then, flashing upward, broke into the air with a scattering of wine-like spray, and bored down again to the depths. The fisherman's rod had curved like a stalk of wheat, and bright diamond drops were racing along his taut and singing line.

The sun was low when the canoe slipped shoreward to a portage that opened as might a leafy tunnel leading straight into a slumbrous woodland heart. Beside it, the rapid growled interminably like a vast and shaggy watchdog. Alphonse, with a chuckle, balanced the great trout, laid it softly in the moss, and swung the canoe over his head. The quick pad-pad of his moccasined feet seemed at once to be obliterated in silence.

The fisherman lingered on a trail cushioned with the bronze rain of pine needles. Mounting irregularly, it wound between great boles, whose topmost branches were woven into a

canopy that stretched high, green and motionless. Beneath this canopy lay nooks, corners and caverns, windless places and spaces—glade and thicket. The fisherman passed on, blending like a shadow with this divine serenity. At the end of the portage gleamed a lake.

'M'sieu can see Jacques and Alcimore?' said Alphonse, leaning on his stroke when they had re-embarked.

'No, not yet!'

'So, over de bow.'

The canoe swerved ever so slightly, and, staring over the knife-like prow, the fisherman detected two tiny flashes that glimmered intermittently and far away.

'Dey travel fas,' went on the Frenchman. 'Two hundred mile in five day wit' many portage.'

But this time the fisherman did not answer. Alphonse, with his eyes wandering from the distant point to the figure which, even in the canoe, never entirely lost its erectness, fell to thinking once again of the strange chance that brought him and Jacques and Alcimore a hundred miles over the hills to live with this strange gentleman, who caught so many fish and said so little.

II.

He had arrived the summer before, quite unexpectedly, at Fond du Lac, which is, as every one knows, at the end of a narrow-gauge railway that runs north through the Laurentians not far from Quebec. And at Fond du Lac he had asked Pierre Lozeau, the postmaster, in the most perfect French possible, how he should get farther north. It seemed, on looking back at it, that that French had stirred something in the soul of Alphonse, who was lounging in the doorway. He had not dreamed that his own tongue could be so beautiful. So it was a very natural thing that, moved by the desire to hear more of it, and being a free man who had just come off the drive, he should offer to take m'sieu north—as far as m'sieu should wish to go.

That was the first time he had ever looked into the eyes of m'sieu. They were very remarkable—sometimes gray and sometimes green or blue—they seemed to be full of little hidden fires that either melted one's heart or scorched it. Then, again, they were the eyes of one who sees a very long way. Sometimes they were like ice in the early winter, and sometimes as tender as the April sunset. When Alphonse recovered himself, he heard m'sieu say that they would start at once. Then the stranger waved his hand at the station platform, on

which were piled six large leather trunks. When Alphonse had engaged Jacques and Alcimore for the trip, and they all went toward the canoes, it was discovered that from each trunk there had been scratched out a name.

And all this, reflected Alphonse, with his eyes fixed on m'sieu's back, was over a year old. There was that curious trip northward, the strangest trip he had ever made. They soon got into virgin country untouched by the lumberman's axe. Sometimes m'sieu would drive them on from morning till night, and the next day he might lie on his back and stare for hours at the heavens. But all the time Alphonse noted that the lines and wrinkles were leaving his face. In a month he had seemed ten years younger.

Then, too, had come that marvellous night when m'sieu had ordered Alphonse to open a long box, and took out his violin. For a time he gazed at it, turning often to peer into the woods with half-closed eyes. Suddenly he laid his cheek against it and began to play.

And as he played, Alphonse and Jacques and Alcimore began to shiver. Moved by uncontrollable impulse they drew closer together. The night turned blacker, and as the violin deepened its unearthly note, every wolf on the ridge yelped back its answer, and a carcajou, leaning by the river-bank, whined and cried. Wilder and more fearful came the music, till the shadows around seemed full of spirits who were moaning and wringing ghostly hands.

But, just as suddenly, the note changed. The violin ceased its wailing, and from its hollow throat floated a song. The song was so sweet that Alphonse thought at once of Philomèle, the girl he hoped to marry. From the woods there came a strange twittering as the song lifted through and roused drowsy birds to answer its magical message. In the middle of the most beautiful part m'sieu stopped abruptly. Instantly the three Frenchmen had frozen into rages. The whole thing might have been a dream.

The very next day, after portaging around a rapid, they had come to Lac Perdu, a barren sheet lifting flat to a horizon ringed with unruly hills. Thrusting down from the north was a long point, where great white pines stood in ordered ranks at the very water's edge. The stranger saw it and stared wistfully.

'What is it called?' he asked.

Alphonse shook his head in ignorance, but Alcimore spoke up from the other canoe. 'Pointe des Pins, m'sieu. She's all desert, dis lake. No mans live here.'

The stranger stared again, then nodded and smiled contentedly.

III.

And since then many things had happened. The cabin of M'sieu Brown—for thus were

addressed the letters that came to Fond du Lac—was finished, and another for the three voyageurs. That of m'sieu stood near the water, and the other a little way off. The route to Fond du Lac had been traversed many times by Jacques and Alcimore. Nothing now lacked in security and comfort. They looked very romantic, those two cabins, with the roof logs that overhung so far in front to make shade—just like bushy eyebrows. The fisherman surveyed them with satisfaction as he now approached.

'A good trout,' he said, and dangled the great, iridescent fish. 'Five pounds, I think.'

'Seex,' said Alphonse cheerfully. 'Observe his tail, how broad, how strong! M'sieu will go again to dat pool to-morrow.'

M'sieu smiled. 'To-morrow we commence the second year of your service. You are content for another twelve months?'

Very slowly Alphonse drew a beautiful curve in the white sand with the blade of his paddle. 'M'sieu,' he answered with a touch of emotion, 'dere is somedings all mens want—his woman. Lac Perdu, she's wan fine lake, but she don't take de place of Philomèle Doucette. I wait wan year more—dat's hall right; but after dat I guess Philomèle she's say somedings, too.'

Monsieur Brown's eyes took on a softened look. 'And if at the end of the year I should say to you, "Take my cabin, my friend Alphonse, and the canoe and tents and all, except what I brought to Fond du Lac, and live here with Philomèle"?''

Alphonse caught at the lean brown hand, then drew back in confusion. 'M'sieu, I do not know how,' he stammered, and added, 'but will m'sieu not live here any more?'

'No, not here—you see, Alphonse, I have discovered that I was not meant to live in one place. Twenty years from now you may follow me by a trail of cabins, all leading farther north. I shall be in the last one.'

'M'sieu, then, is not mar——?'

The words died on his tongue. The glance of M'sieu Brown had hardened into steel, and his lips were pressed tight. A dull flush had risen to his temples. He stood very still, and suddenly terrible and magnificent.

'But, m'sieu,' faltered Alphonse piteously; 'I—I——' Then again he stared.

The strange appearance had vanished and left his master as kindly as before. 'Alphonse,' he said evenly, 'it is quite right to ask. We wish each other to be happy. Is it not so?'

'Mais certainement, m'sieu.'

'I was married—but now—I have not a wife.'

The Frenchman felt something tugging at his heart-strings. Never had m'sieu seemed so noble. Just then the canoe of Alcimore ran swiftly ashore beside them.

Alphonse took the leather mail-bag and followed m'sieu to his cabin. There the contents were spilled on a table. On top of the heap lay a violet envelope from Philomèle.

'Ah,' smiled M'sieu Brown. He reached suddenly and plucked out another envelope. It was long and white. Alphonse noted that it bore no stamp, and had a great red seal that glowed like blood. M'sieu looked at it hard.

'Leave me,' he said presently. His voice had taken on the tone it had that first day in Fond du Lac.

At supper-time he shook his head and would not eat. Alphonse moved away puzzled and disconsolate. The sun went down, and night closed in, black and starless. Lac Perdu was blotted out, and only by the lispings along the shore could one tell where the water lay. M'sieu lit his lamp, and the three Frenchmen clustered together and stared across at the window, through which they could see the figure of m'sieu sitting with a square sheet of paper in his hand. Sometimes he leaned his head on his palm, but for hours there was nothing more than that.

At midnight they were wakened by what Jacques took to be a wendigo in the woods behind. It was the violin of m'sieu. The sound of it gripped and wrung their hearts. The lamp had long since been extinguished, and he was playing strange things to himself in the dark. At daybreak he looked ten years older.

IV.

It was not long after this that M'sieu Brown decided to go a day's journey down the river, and fish for a week in a certain pool. Alphonse nodded, and suggested that he go down a day early with the tent. He would prepare such a camp as befitted the dignity of his patron.

To this M'sieu Brown assented, so Alphonse paddled away with the middle thwart of his canoe gripped tight between a sinewy calf and a curving thigh.

That evening, the camp half made, he caught, far down the river, the flash of paddles. Presently a canoe, edging along the shore on the rim of the heavy water, thrust its bows around the nearest point. In the stern sat Pierre Lozeau. In the middle was a strange woman. Then Pierre nosed in to shore, and the woman spoke. 'How far are we from Lac Perdu?'

The pulse of Alphonse beat a shade quicker. She had spoken in French—the French of M'sieu Brown. 'One day, madame,' he said curiously.

She turned to Pierre, 'Then, do we camp here? I'm very tired.'

'If madame wishes—yes—dat's hall right.'

He pointed to the work of Alphonse. 'She's wan good place here.'

Alphonse stepped forward quickly and steadied the canoe while madame got out. She stood for a moment, walked stiffly to the little point and stared upstream. The livid sunlight poured over her, and Alphonse instantly decided that she was more beautiful even than Philomèle. There was something strangely familiar about those eyes, those delicate features, and the proud carriage of that head. Suddenly it flashed upon him that upon the log-hewn wall of his cabin on Lac Perdu the picture of this strange lady had been pasted. It was taken from an English magazine. He had found it crumpled in the sitting-room of M'sieu Brown. At the time he wondered why m'sieu should have done this—but now!

He strode into the bush, and staggered back under a mountain of cedar boughs. Half-an-hour later madame had eaten, and lay on a scented mattress staring into the fire.

It was not till an hour after, when she had drawn the doors of her tent, that Pierre Lozeau jerked his chin towards those white walls. 'She's look for M'sieu Brown.'

'What for she's do dat. M'sieu Brown she's not maree.'

Pierre pressed a tawny finger into the bowl of his pipe. 'Hall I know, she's come to my bureau on Fond du Lac an' ask if dere's wan Henglishman who's live on Lac Perdu. Den, by gar, she's mak me tak de canoe and go on voyage.'

Alphonse was sharply torn between a sense of the beauty of the strange lady and a curious throb of protection for his patron. M'sieu did not want the strange lady, or he would not have meant to destroy her picture. At the same instant the printed name flashed into his memory.

'She's de Comtesse de——' he stopped abruptly.

'What's dat?'

'She's look lak picture I see of wan Henglish Comtesse, an' I guess I look lak wan beeg fool for go wild-geese chase on Lac Perdu.' He stretched out on his back, feet to the fire, and instantly fell asleep.

V.

An hour after daybreak Alphonse had killed enough trout for breakfast, and came silently ashore, standing up in his canoe. When he looked up he saw the strange lady. She wore a great cloak, but was shivering in the gray of the morning.

'*Bonjour*, madame.' He kicked the camp fire embers into redness, and heaped on dry birch.

The strange lady smiled her thanks, and spread her long, white hands to the flame. 'Is M'sieu Brown well?' she said very distinctly.

Alphonse, already busy with his trout, started. 'Oui, madame, ver' well—now.'

'Has he been sick?' There was a sudden lift in her voice.

'*Mais non*, madame; but M'sieur Brown he's wan sick man when he strike Lac Perdu.'

She glanced up sharply. 'What was the matter?'

'Don't know, madame. Very strange *maladie*. Jus' same as somedings go wrong here an' here.' He touched head and heart. 'Never see dat kind *maladie* on Lac Perdu or Fond du Lac before.'

'But he is well now?'

'I guess yes. When he play de fiddle he feel pretty queer.'

'Why do you say that?'

'*Bien*, madame, sometimes I want to dance all de way from Lac Perdu to les Rochers Rouges—and the nex' minute he bre'k my heart wit dat fiddle.'

'Are you very fond of M'sieu Brown, Alphonse?' Madame looked up the river.

'*Oui*, madame. She's wan fine man—M'sieu Brown.'

'So am I, Alphonse, and'—she stooped forward, and her voice grew very tender—'I want you to take me to see him.'

The Frenchman examined his trout gravely. It had always seemed a strange thing that M'sieu Brown, such a man, should bury himself on Lac Perdu—and worse than that, talk of going farther north every year. He had said, too, that he was married, but had no wife. And here—he glanced at the strange lady with bright, curious eyes—here was the most beautiful creature he had ever seen, also alone, also unhappy. Suddenly it appeared to him that in this delightful world there was misery enough. Why should it be increased by these two, between whom there was some link he did not understand? What harm could so wonderful a woman do to any one—even his own patron? The biggest trout quivered in his hand, and he felt on the edge of amazing things.

'Madame,' he said slowly, 'M'sieu Brown comes here to fish. *Voici* his *campement*. He come, I guess, 'bout seex o'clock. Suppose madame wait. I feex him up, *le campement*, *bien confortable*. Madame eat, rest—sleep. *Bien?*'

The strange lady glanced at him, turning her head with a quick, bird-like alertness. 'But is there any other reason why I should not go on?'

'None, madame,' countered Alphonse hastily. Then he paused, for romance had begun to flutter in his heart. He would make a *campement*—one worthy of this lady and M'sieu Brown. He had a restless consciousness that whatever he might offer would be infinitely less than this proud lady had been accustomed to

receive, but it would be the finest *campement* ever seen on Lost River. He looked at her with pleading eyes. 'Madame will stay? Is it not so? Pierre Lozeau, he shall return to the bureau at Fond du Lac.' He hesitated, and added swiftly, 'An' if madame, she does not stay on Lac Perdu, I shall tak her down the river—eh?' A flush mounted to his swarthy cheeks.

And into madame's face, as she met that beseeching gaze, there also crept a rising colour. 'Very well, Alphonse. If I do not stay, you shall take me back to Fond du Lac.'

She ate with a delicate hunger, and watched Pierre Lozeau, as in high content he slid downstream. Alphonse finished his breakfast, wiped his fingers in moss, and sprang to his feet. '*Madame, maintenant pour le campement.*'

By mid-afternoon it was finished. The tent was knee-deep in small cedar tops that cushioned it like a spring mattress. The space in front of the tent was floored with flat-split birch. Beyond this rose a royal fireplace, flanked with boulders and backed with great logs that would prison the heat and send it into the open tent. Steps cut in the bank were paved with flat stones, and a small floating dock thrust out from the shore into black water. On one side lifted a shelter roofed with bark, that housed a table and two small opposing benches. It was all sweet and odorous, with the scent of fresh-hewn timber and the sharp fragrance of cedar. At four o'clock Alphonse straightened his back. 'M'sieu Brown,' he said quickly; '*le void.*'

VI.

The strange lady looked up and saw a canoe in mid-stream. It moved swiftly in the centre of the ridge of saw-toothed swells that marked the toe of the rapid. In the stern crouched Alcidore, with his eyes glued to the surging line and feeling the weight of the water with his skilful paddle-blade. In the centre knelt M'sieu Brown. He was bent forward, and stared at a miniature whirlpool in the back-water, above which dangled a single fly. The tail fly had been snapped under. Presently the nose of the canoe edged into the back current, and the fight went on. To Alphonse all this was an old story. He glanced at madame.

Her face had become deadly pale. Her thin hands twisted nervously together, and her lips were moving. He could not hear the words, but they seemed to go out to M'sieu Brown, who turned so suddenly that but for the quick balance of the steersman the canoe would have upset. At the sight of the strange lady he motioned to Alcidore, and they began to come slowly across the stream, and all the time his face became colder and sterner. It was just as

though her eyes had flung out an irresistible cord that was drawing him to the shore. Presently he reached land.

Alphonse shot a swift glance at the face of his patron, and gesticulated wildly to Alcidore, who came, wondering. Instantly Alphonse pulled him down into a clump of ground hemlock. M'sieu Brown, who had taken not the slightest notice of this pantomime, went slowly up the new flagged steps, and forward to where the strange lady stood by the tent door. Two pairs of glittering eyes devoured them.

'Seems lak I know dat woman,' whispered Alcidore.

'Tch!' hissed Alphonse. 'You spik wan leetle word and I sack you, by gar.'

Alcidore grunted a protest, but just then the strange lady stretched out her hands. 'Arthur, Arthur, don't say you'll send me away again!' she implored.

M'sieu Brown trembled quite visibly. 'Why did you come here?'

'I can't live without you. I would have followed you anywhere. Let me stay now.' A royal colour rose to her cheeks. 'I was only dreaming before—I'm awake now.'

'And——'

'He's gone—gone for ever. I was crazy, a fool—but never what you thought—Arthur. Take me—keep me close to you—always.'

M'sieu Brown lifted his eyes and surveyed her petitionary beauty. 'I'm done with life—your way of living. I've lost the taste for it, and shall never go back.'

'You?' she whispered. Her hand fumbled at her throat. 'You—what will——' The rest dwindled into silence.

'There are worse fates than to be forgotten,' said M'sieu Brown slowly.

The strange lady looked at him for a moment, and swayed ever so slightly. 'Then let me be forgotten, too,' she implored. 'Arthur, don't you understand? I want nothing more than you can give me. I am content to stay here always; I should be proud to do that. I have learned to love it already, and,' she faltered, 'beloved—I love you.'

M'sieu Brown caught his breath sharply. 'To live here always—year after year—and to die in the north with me,' he said unsteadily. 'Are you ready for that? Can you forget the life that is behind?'

'My—life—is—just—beginning,' she whispered faintly.

And at that he stepped forward very swiftly.

Not long after the sun dropped behind a bank of cloud, and night came on fast. The flames were leaping in the big fireplace. M'sieu and madame, lying on the spruce branches, were gazing into them, when, quite unconsciously, m'sieu reached for his fiddle-case. Alphonse lay back and closed his eyes.

Presently, woven into the rumbling rapid, came the music, a lifting thing that picked up one's heart and moulded it into many shapes. There was silence when it ceased.

Next day they headed for Lac Perdu. Madame's lips parted in delight when she caught sight of the cabin. The canoes touched shore, and without a word Alphonse dashed toward his own log-house. Once inside, he stopped breathless before a picture pasted to the timbers. 'By gar,' he panted, 'Alcidore, she's wan beeg fool. Suppose Madame Brown she see dat.' Then he tore it from the wall.

THE ROMANCE OF COAL-TAR.

By JOHN HILL, M.B.

I.

THE huge development of the complex coal-tar industry forms one of the most romantic chapters in the history of applied science. Tar is well known as one of the most unsightly by-products in the manufacture of coal-gas. To the average mind it is simply a dirty, sticky mess, but to the experienced chemist coal-tar represents a veritable treasure-house of immensely useful and beautiful substances. The astonishing advances of the analytical chemist within the last fifty or sixty years have made a fascinating romance of what is usually regarded as a very prosaic subject.

For many years after the introduction of coal-gas, tar was looked upon as refuse. It became, in fact, a disagreeable nuisance, the

disposal of which caused the manufacturers a great deal of trouble and expense. Any demand that existed for it was far short of the amount constantly being produced at the gas-works. Eventually, coal-tar became such a drug in the market that when attempts were first made to obtain useful results from its distillation the by-product was willingly given away on condition that the distillers removed it at their own expense!

One of the first products resulting from these early experiments in tar-distillation was naphtha, which was employed by that far-famed Glaswegian, Mackintosh, as a solvent for rubber; it is still used in the preparation of the waterproof material that now bears his name. Further investigations proved its value in the manufacture of certain kinds of varnish;

and over seventy years ago a flare-lamp for the combustion of naphtha was patented. Precisely the same type of lamp is still to be seen on some costers' barrows, and is a favourite method of illuminating travelling shows.

Another discovery that provided a useful and welcome outlet for the gas-companies' refuse was the preparation of timber in such a way as to withstand the action of water. It was found that wood which was exposed to water or moist soil was much more durable if previously impregnated with heavy oil. The best oil for the purpose was found to be creosote, another by-product of the gas-works. Creosote is still largely used on railway sleepers, fences, telegraph poles, and on the wooden portions of piers and harbours, on which it has a most useful preservative action.

II.

But the fullest possibilities of coal-tar as an article of commercial value were not properly realised until scientific knowledge and resource had been brought to bear on the subject, its chemical constitution analysed, and its properties and reactions investigated and recorded. In this way it was found that coal-tar could be split up into about ten primary products, or 'crudes.' From these, some three hundred 'intermediates,' such as the well-known aniline, could be obtained, these in turn being the source of thousands of dyes of every conceivable hue and shade.

Some of the more important of these derivatives are benzene, xylene, toluene, naphthalene, anthracene, phenol, and cresol. Purified phenol is familiarly known as 'Carbolic Acid.' The other materials owe their importance to being the starting-point in the preparation of numerous aniline dyes and other synthetic products of great interest and value in commerce, medicine, and the arts.

The extraction of these substances from coal-tar is accomplished by a process technically known as 'fractional distillation.' Their separation from one another depends on the fact that each has a different boiling-point. The tar is heated in a special boiler, with which is connected an elaborate thermometer, very sensitive at high temperatures. As the temperature in the boiler is gradually raised, the more volatile substances distil over more or less pure, being followed one by one by those which are less volatile—that is, those with a higher boiling-point. Each distillate is collected separately, according to the indications of the thermometer.

Very clever, yet how childishly simple in its cleverness! Nevertheless, for many years after it was first discovered this process was regarded as an interesting curiosity, and nothing more. That the various components of coal-tar could be sifted out in this way was

intriguing enough certainly, but only in a scientific way. Commercial and business men, including even the gas-manufacturers themselves, scoffed at the idea of this laboratory experiment ever being put to any practical use. It is a commonplace (but a standing reproach withal) that we, as a nation, are slow to recognise the value of the research laboratory. We are apt, as a rule, to despise theoretical knowledge of discoveries of which we fail to see the immediate use.

Fortunately, however, for the credit of British genius and enterprise, it was an Englishman, the late Sir Wm. H. Perkin, who first drew the attention of the world to the almost infinite possibilities of coal-tar. While still a youth of eighteen, he made the remarkable discovery that aniline, when oxidised by potassium bichromate, produced a colouring matter of a beautiful shade of purple that had never been seen before. This colour all the world now knows as 'mauve.'

But mauve was only the first of an immensely long series of artificial dyes which skilful chemists were able to produce from the unlovely by-products of the gas-works. Before long, as the investigation of the subject progressed and was widely taken up throughout Europe and America, an astonishing variety of beautiful dyes of great commercial value was produced. Volumes (and extremely interesting ones, too) might be written on the subject of these dyes alone. Many of them, such as alizarin, indigo, Martius yellow and Victoria orange, have proved more successful commercially than the natural dyes which they imitated. Except for a limited field, natural dyes, such as cochineal, logwood, madder, turmeric, and catechu, have been largely ousted by the prodigious growth of the artificial colour industry, while certain mineral colouring matters, chiefly chrome yellow, manganese brown, and (to some extent) Prussian blue, have also been successfully imitated by the redoubtable chemist. Other colours, like magenta, Bismarck brown, malachite green, and methyl violet, have never yet been found in Nature at all, and are of purely laboratory origin. This is an indication of the huge development of the artificial dye industry.

III.

Although aniline, the raw material for so many dyes, is found only in traces at the gas-works, it is easily prepared from benzene, which occurs abundantly in coal-tar. It is interesting to note, in passing, as evidence of the ingenious utilisation of by-products, that in the preparation of aniline from benzene another useful substance is produced. This is nitro-benzene, a substance with an odour like that of bitter almonds. It is extensively used for scenting soap.

It is no exaggeration to state that the uses that science has discovered for coal-tar derivatives are almost legion. Other well-known artificial perfumes are Neroli oil, made from naphthalene, sweetly redolent with the fragrance of orange-flowers; and oil of jasmine, which is prepared from benzene. Equally familiar are artificial musk and oil of wintergreen, derived from phenol. Some of these have been built up synthetically in imitation of the chemical formulæ revealed by analysis. Others have a perfume resembling the natural odours, but are quite different in composition.

Benzene alone, from its elaborate chemical constitution, can be made to yield a host of useful drugs like phenacetin, antipyrin, aspirin, sulphonal, and veronal, besides numerous antiseptics and local anæsthetics. Benzene itself is an antiseptic, but its importance lies in its being the starting-point in the preparation of others that are of greater use to the surgeon, such as picric acid, and several aniline dyes, notably methyl violet, methylene blue, flavine, and brilliant green. Phenol, naphthol, and cresol are other tar-products of proven value as antiseptics and disinfectants.

Still another outlet for the utilisation of the refuse from the gas-works is in the manufacture of lyddite and tri-nitro-toluol (better known as 'T.N.T.'), explosives which play an invaluable part in blasting operations, as well as in the less useful sphere of war.

IV.

As a matter of fact, one can hardly count the uses of coal-tar. It provides the photographer with his developer, the microscopist with his stains, the dairyman with the yellow colour for his butter, and the up-to-date housewife with patent fuel, while in the days of war-time sugar-scarcity still another tribute to its usefulness was the ubiquitous saccharine tablet. By the development of the coal-tar industry a new world of discovery and invention has been opened up, and new substances, of astonishing utility and variety, have been revealed. The advances made in the utilisation of innumerable by-products form one of the greatest triumphs that chemistry has ever achieved. From being spurned as rubbish, coal-tar is now recognised as being of inestimable value, and has been truly described as 'one of the most useful substances in the world.'

The history of its evolution reads more like a fairy tale than an account of scientific progress. A famous humorist has thus neatly expressed it:

There's hardly a thing that a man can name
Of use or beauty in life's small game
But you can extract in alembic or jar
From the 'physical basis' of black coal-tar.
Oil and ointment, and wax and wine,
And the lovely colours called aniline;
You can make anything from a salve to a star,
If you only know how, from black coal-tar.

A GIPSY OF THE NORTH.

CHAPTER IX.—A NEW HOPE.

SICK with despair, Carwyke stared at the wrecked kayak. Then the river, the shattered craft, the woods and hills faded from his view, and he saw only the face of a girl with an aureole of golden hair, and with blue eyes that met his own in level gaze. He had spoken no word of love when he might have done, and now that word must go unspoken for ever. As that conviction assailed him an inarticulate sound broke from his lips, and without a word, or so much as a glance at his companion, he began to stumble forward down-river.

Eskimo Billy followed him, and in silence they reached the tail of the rapids, where something caught the quick eye of the ex-whaler, who pointed silently.

'What is it?' asked Carwyke hoarsely, his vision blurred by fear.

'I reckon it's Missy's paddle caught in ther whirlpool.'

Carwyke's vision cleared a little, and for a moment, like a man hypnotised, he watched the paddle drift round the whirlpool at the foot of the broken water; then he looked down the river with its gloomy woods on either bank.

'Do you think there's any chance she came through, Billy?' he asked in a shaking voice.

The ex-whaler's face betrayed that he had no hope. 'If God worked a miracle——' he began; then broke off and added tonelessly, 'I guess we'll find her below somewhere.'

Carwyke knew that he meant they would find her body, and the thought was agony to him, intolerable. He clutched at a straw. 'Could Norma swim?'

'Like a seal,' answered Billy. 'But what good would that be to her in water like that?'

He jerked a thumb towards the rapids; and looking at the tattered water, racing between the boulders and foaming over rocky ledges, Roy Carwyke knew that no hopeful answer to the question was possible. The strongest swimmer would be tossed like a dead stick in that roaring flume, broken on the ledges, battered by the boulders. The straw at which he had clutched broke in his hands, and with despair in his eyes he looked down the river. Three hundred yards down there was a small sand-bar, about which had gathered a drift-pile of tree-trunks and other debris brought down in

the spring floods. As his eyes fell on it, Billy pointed. 'I guess thet's where we'll find poor Missy,' he said hoarsely.

Together they began to walk in the direction of the drift-pile. They had gone but a few yards, however, when the nature of the bank forced them to climb to the wood above, and make a detour towards the place for which they were making. The wood was very thick, many windfalls barred their way, and twice they were forced to climb high dead-falls where the fallen trunks were piled criss-cross in a most amazing fashion. Half-an-hour passed before they reached the place where they could descend to the drift-pile, and at that point Carwyke halted. 'Go down, Billy,' he said in a shaking voice; 'I—I can't.'

Without a word in reply the ex-whaler climbed down at the bank towards the heap of debris cast out by the surging stream. For a moment Carwyke watched him, then, dropping to the ground, sat with his face buried in his hands. Minutes passed without anything happening, when a sudden shout made him look up sharply—a shout that had a jubilant note; and a second later he saw the ex-whaler come round the drift-pile at a run. 'Mista Carwyke! Mista Carwyke!'

The man was waving an arm excitedly, and with a great surge of hope in his heart Carwyke began to scramble down the bank. For the moment weariness and weakness were forgotten. As he reached the sand-bar he started to run, drunkenly—but still to run. When he reached his companion he was gasping, but managed to cry, 'Have you—found—her, Billy?'

'Nope, thank God!' answered the other, gripping his arm and leading him round the debris. Then he stopped and pointed to the sand, crying excitedly, 'Look there, Mista Carwyke! Look there!'

Carwyke looked at the place indicated, and saw the impress of feet, which still showed moist in the sand. He stared incredulously. He knew what those marks meant. Some one had landed on the bar, wading from the river; and in this desolate land that some one could be no one but Norma Mannering. A great relief flooded his mind, and in a surge of gratitude the words broke from him, 'Thank God!'

'Yep!' said Billy. 'I reckon He worked ther miracle after all.'

For a moment they stood without further speech; then, looking round, Carwyke asked a sharp question, 'But where's Norma now?'

Billy nodded towards the woods above. 'Up there somewhere. Ther footsteps lead to ther bank. I guess Missy climbed up, an' started to go back to meet us, maybe at ther point where ther river forks.'

'Then we must get back quickly,' said Carwyke, turning towards the bank.

'One li'l minute, Mista Carwyke. I reckon

we can't both go. To begin with, yo' ain't fit; an' again, it's best thet one of us should watch ther river-bank in case Missy hev'n't gone so far back on ther trail. We don't want to miss her here.'

'No.' Carwyke looked up at the gloomy woods, and added in a husky whisper, 'That would be terrible.'

'Then I reckon yo'd best go back to ther canoe, as yo' ain't fit for travel in timber. Yo' can keep a look-out there; an' if yo' was to let off a rifle now an' then, I reckon it wouldn't do no harm. Mebbe Missy might hear it, an' work towards yo'.'

Carwyke's spirit rebelled at the inactive rôle assigned to him, but he knew that the other's decision was the right one. His head was aching intolerably; and as he stood there his legs shook under him with weakness and weariness, for the shock following the Russian's murderous activities was now asserting itself more strongly than at any moment since the actual flight from Little Novgorod. Reluctantly he was forced to agree.

'You're right, of course, Billy. I'll go back to the canoe.'

'An' I'll go on ther trail of Miss Norma. I reckon I won't hev to go so very far—for Missy ain't used to woods. I guess I'll be back wi' her inside an hour.'

'I pray God you may!' answered Carwyke fervently, and with a cheery wave of his hand the ex-whaler departed.

Carwyke watched him mount the bank on the trail of the girl so miraculously preserved from death, then he stumbled round the wood-pile, and laboriously climbed the bank on the farther side. It was three-quarters of an hour later when he reached the canoe; and though his head was reeling and his heart throbbing painfully, the first thing he did was to climb to the edge of the wood, to fire his rifle into the air twice. After the second discharge he listened hopefully, but no answering shout came from the recesses of the dim woods. A little disappointed, he seated himself at the top of the bank; and as he did so, a phrase spoken by the ex-whaler shot into his mind, 'For Missy ain't used to woods.'

New fears assailed him. That which Billy had regarded as being a hopeful element suddenly took on itself an aspect most sinister. It was true that Norma was unused to timber. The wide tundra—treeless, except for growths so stunted as scarcely to rank as bushes—had been her home. There, no doubt, she had moved at will and in safety, all the points of the compass readily discernible to her accustomed eyes; but in the woods she would be helpless as a babe. Even an expert woodsman might lose himself in their recesses, and for her their depths were fraught with peril. He remembered the great dead-falls he himself had

climbed. There would be others—many of them—in the virgin forest, which in all probability had never once rung to the sound of an axe. If she encountered any she might try to walk round them, and, in doing so, lose all sense of direction.

Beads of sweat broke on his forehead at the thought. He recalled stories of men who had so been lost in the great forests farther south; and remembered a man whom he and two other men had found, dead, with his rifle in his cold hands and a bullet in his brain. The man had left a message scrawled in a note-book, telling of his wanderings and his accumulating despair; and as he thought of that message, Carwyke shuddered as he had not done when he had read it aloud to his companions. In an agony of apprehension he sprang up, and advancing a hundred yards or more into the woods, fired his rifle thrice in rapid succession. At the point where he stood the roar of the river was scarcely noticeable, and the sound of the shots reverberated through the forest very clearly. He stood with straining ears waiting for a reply. None came. Silence settled on the dim woods as the reverberations died away—a silence that was absolutely unbroken. For a time he stared with hopeless eyes into the serried ranks of the trees; then with hopelessness once more settling on his heart, he stumbled back to the river-bank, looked down its roaring reach for any sign of the girl, and threw himself upon the rough grass with a gesture of despair.

How long he lay there he never knew. At some point overcome with weakness and exhaustion he must have slept, and scarcely had he opened his eyes when he saw Billy emerge from the wood—alone! He staggered to his feet, and, as the ex-whaler advanced, saw that his face was very grave.

'Well?' he asked, in the husky whisper that alone was possible to him. 'Well?'

Eskimo Billy shook his head. 'No luck, Mista Carwyke. I lost ther trail back there in ther wood, an' couldn't pick it up again. I ought to hev took a gun and some grub, an' then I might hev kept on, though I'm ther most doggeden tired man on ther continent. Guess I'll feed up, an' then hev another shot. I've blazed ther way, so thet I can find my road back.'

Without a word Carwyke turned away, despair once more at flood-tide. Norma was lost, and the great woods would be her grave. He tried to assist the other when he began to build a fire and cook a meal; but sheer weakness compelled him to desist and sit down, his head between his hands; and it was not until Billy spoke to him that he looked up. The ex-whaler held a tin mug in his hands.

'Drink thet, Mista Carwyke! Yo're needin' it. Good thing I remembered to bring it away from Little 'Ell.'

Roy took the mug, and began to sip the vodka that it held. It revived him a little; and when the meal was ready he swallowed as much soup as his swollen throat permitted, then watched the other stretch himself by the fire.

'An hour's sleep, and I'll start again. I guess I sha'n't lose no time thet way, for Missy'll hev to halt somewhere herself.'

Rather more than the hour passed before Eskimo Billy rose and stretched himself. Whether he had slept or not, Carwyke, who had been lost in gloomy thoughts, did not know. He himself rose as Billy began to make a pack of food.

'I'll go with you—Billy.'

The ex-whaler looked at him shrewdly, and answered quietly, 'I guess not, Mista Carwyke. Yo' jest ain't fit. Yo' couldn't make a quarter of a mile back there.' He jerked his head towards the forest, and added, 'It's a most almighty tangle!'

'But——'

'Yo' ain't feelin' good, an' yo' know it, Mista Carwyke. Yo'd jest peter out an' be a hindrance rather than a help. Better let me go on my lonesome; I'll go quicker, an' maybe hev Missy back in half ther time. One thing I'll swear, I won't come back without her.'

In his heart Carwyke knew the man was right, and was forced to admit it. 'I couldn't travel quick, that's true, Billy.'

'Then yo' jest stop here, Mista Carwyke. Maybe yo'll do a whole lot more good. Missy at ther point where I lost ther trail was makin' nor'-west, thet is towards ther water we came down before we turned at ther forks; an' if when yo're feeling a bit more good you could haul ther canoe with a tow-line up to ther main river, an' wait at ther dividing-point, yo'd be able to keep a look-out there, for it seems to me thet Miss Norma is working thet way, mebbe to watch out for us comin' down ther river.'

'I hope you're right, Billy!'

'I'm dead sure of it. What for is she makin' thet way, if she ain't?'

'Then I'll remain here, and do as you say.'

'Right, Mista Carwyke. Now, I guess I'll start.'

(Continued on page 178.)

DEATH.

BEWILDERED, lonely, anguished, full of fears,
Too spent for idle speech, too numb for tears;
Like a frail blossom kissed by icy breath
The soul sinks swooning in the arm of death.

Then breaks the song—the song sung by the stars;
Up leaps the soul and tears away its bars;
Enraptured, thrilled, and while they say, 'he dies,'
All gladsome to the Heart of Life he flies.

Chambers's Journal

SEVENTH SERIES

CURIOS AND MEMORIES.

By LAWRENCE G. GREEN.

ONE of the keenest joys of travel comes long after the journey's end ; for it is then, with a settled mind, that all the complexities of life abroad, the wonders of tropic coasts and islands, distant seas and teeming Eastern cities, can be recalled. There is none of the discomfort you experienced—the heat, mosquitoes, and aching legs—when you first stood thrilled at the sight of some queer contrast to your own land. Given imagination, and you may rove the world in your arm-chair at home. Nothing will stimulate more readily a living picture, full of colour and action, than a heap of worthless curios such as I have before me as I write.

A cigarette first ! I choose one from a gun-metal case, with a beaten-gold dragon belching fire at me from the lid. The wall-paper and heavy curtains of my room fade out, and sun-scorched Beira shimmers on a waste of sand : Beira, where muscular Shangaans launch their dug-out canoes in the mud creek ; where crocodiles sprawl in the sunshine up the Busi River, with venturesome little birds picking their teeth ; where Portuguese officials, with strained yellow faces, drink gin outside the Palm Square kiosks. I can hear again the 'Ping-ing-ing-zzz' of the malaria mosquito, beating viciously against the fine gauze netting on the veranda.

On the mantelpiece are two conch-shells. Wonderfully shaped, their shining brown and black curves recall the old jetty at Mozambique, and the pleading Swahili boy who sold them to me. That tiny coral island was Portugal's first stronghold in East Africa ; and as I hold a shell to each ear I listen once more to the deep booming of the surf as it breaks far below the grim ramparts of fort San Sebastian. The old conquistadores heard that melody of the sea as they gazed out beyond the palms for the fleet of dhows that would bring Arab foes. Strange that a pair of smooth shells can roll back the centuries to the days when the hardy navigators of Portugal came plunging into a tropical back-water with their crazy three-deckers.

A mother-of-pearl necklace, touched by the electric light, throws out rays of delicate pink and blue. There is Dar-es-Salaam in the tropic dawn, with the sun streaming yellow through the palms, picking out a minaret on the governor's palace. Rightly the natives named their

No. 690.—VOL. XIV.

'Harbour of Peace.' It is a bay of pure delight, ringed in by steep green banks, fringed with majestic palms. The brush of a master could not truthfully record the full beauty of a dozen fishing-boats, golden-sailed, beating out of that lagoon to open sea. What continual bustle there is down in the native village, where fat Hindoos loll spider-like outside their fantastic little shops, entreating the visitor to enter and see their wares. And those Swahili shops, too, with piles of light-brown kassava root baking in the sun, bowls of rice, and beans of many colours ! How fascinating it is to watch the Indian cigarette-makers ; a quick grab at the heap of tobacco, a lightning turn of the wrist, the flash of a red tongue, and a perfectly rolled cigarette lies on the fibre mat.

Romance in three syllables—Zanzibar. Some wizened Arab scribe, all the way from Muscat with the invaders, was the genius, I suppose. I possess carved ebony-wood elephants and a dozen other trinkets from that island of sultans and harems ; but the name is enough to bring back clear-cut memories of a coral city—the Paris of East Africa, they call it—where dark Africa and the mysterious Orient jostle in the narrow streets of Malindi bazaar.

Zanzibar ! Your call rings loud and clear in the ears of many a wanderer. I came at night, a purple star-filled night, when the sweet, lingering clove smell drifted out over the waters long before I stood under the betel-palms, listening to the sultan's orchestra playing 'La Paloma.' Who could forget the great mosque, and the marvellous throne of inlaid wood, covered with velvet cushions, littered with peacock fans, where only the Aga Khan may sit ? One wanderer, at least, will journey again to the equator to see the great yellow dome of that mosque rising from a jumble of many-coloured roofs ; to hear the chanting of the muezzin, calling the Faithful to prayer, while a blazing sun swings down and melts into deep ultramarine.

At my feet a rug glows with all the colours of the 'Arabian Nights.' Aden is on the screen now. I lounge under the punkas, gasping, clapping my hands for a whisky-and-soda that I know will be tepid. But what a rug, with its suggestions of yellow desert sand, the

[All Rights Reserved.]

FEBRUARY 16, 1924.

vivid blue of the Arabian sky, the red blood of a slaughtered caravan that never reached the tomb of the Prophet! Allaho Akobar! Farewell!

No post-cards from Port Said; only a tin of amber-scented cigarettes. Light one, watch the lazy smoke curling up from gray ash, and on the white spiral see the busy water-front of the 'wickedest city in the world,' with its open-air

cafés, boy conjurers, and frantic touts. Over all, the tall statue of De Lesseps, the man who linked East with West, his eyes fixed on the achievement of a dream.

These visions have stirred up the wanderlust. I must walk awhile in the streets before I can sleep. That is the penalty for being a rover; a few joyous glimpses of the past, and the present is dull indeed.

A GIPSY OF THE NORTH.

CHAPTER IX.—*continued.*

WITH that for sole farewell, the ex-whaler turned, and once more entered the wood, soon to be lost in its recesses. Carwyke watched him until he disappeared, and then turned and stared, first at the fire, then at the water, and lastly at the sombre woods across the river. Condemned as he was to comparative inaction, it was almost impossible for him to keep down despairing thoughts. Weak though he felt, he had now no desire for sleep, and to smoke was impossible. The melancholy of the woods matched that of his thoughts. The great silence, broken only by the ripple of water, became an oppression to him. Inured to the wilderness as he was and accustomed to solitude, he had never felt so utterly lonely as he felt in that hour, and never had he been so aware of the menace that brooded in the wild.

Hitherto he had taken the chances of the wilderness with a certain carelessness that characterises the man who is the prey of the wanderlust. His life had been staked on a chance a score of times, he had taken great risks with a light heart, and many times had challenged the fate into the hands of which, as he feared, Norma Mannering had fallen; but never had any of these events moved him as he was moved by the thought of the girl's peril. Again he visioned her wandering in the vast woods, subsisting on berries and roots, travelling the fatal circle in which every tree seemed alike, every boggy place like every other boggy place, every little stream as like its fellow as two peas are alike—so, until either flesh or spirit or both yielded, and she sat down in bleak despair to wait for the slow coming of death. The vision wrung his heart, so that he cried out at his own helplessness, 'My God! and I can do nothing!'

Then a new thought came to him. Behind him, somewhere up the river that flowed by Little Novgorod, were Standifer and his crew. Even if Norma were found in the next few hours, this long delay would serve her enemies. Standifer was not a man to yield easily a prize that had been almost in his grasp, and that could still be pursued. As he reflected on the matter he was sure that the scoundrel would try to

follow, and if he had no available craft, he would build a raft of dry logs; and once he reached the Russian trader's post, he would be able to secure a canoe.

That meant that in a very few hours more he would come swinging out of the narrow valley of Little Novgorod into the broader valley which the river drained; and when he reached the Forks would no doubt make a careful search in order to discover which way the fugitives had taken. At the post he would, of course, wring from the woman Marya some account of what had happened there. He would doubtless learn that Norma had fled from the post alone in the kayak; and if he explored this gut of the hills he would find the wrecked kayak, and possibly jump to the conclusion which Billy and he himself had reached at the sight of it.

It seemed that to let Standifer do so would be a desirable thing. In that event, supposing Billy and himself were not to be found, Standifer might go his way in the conviction that Norma was dead. But if he sighted the canoe, or suspected that the girl had survived the wrecking of her kayak in the rapids, he would haunt the neighbourhood until he learned the truth. Or possibly, if Norma made the bank of the main river before Billy overtook her or he himself arrived there to watch for her, she might fall straight into Standifer's clutches.

Weak though he was, that consideration moved him to immediate action. Taking an axe, he entered the wood and cut a couple of poles. The effort made his head spin and ache intolerably; but he persevered, and launching the canoe, he began to pole it upstream. It was hard work and slow, and several times he was forced to beach the canoe and rest his throbbing head in his hands. But though driven to rest, he would not give up, and presently he reached a point where the tow-line promised better than the pole, and, fastening the canoe to a hide-rope which had been among the stores brought from Unapik, he slipped the line over his shoulders and began to drag the canoe behind him, walking along the uneven bank.

This toil tried him more than the poling had

done. His head ached as if it would split. The woods seemed to reel grotesquely in his eyes, and there were times when the rocky hills to the south appeared to skip like lambs, whilst his legs fairly shook, and his hands trembled like those of a man afflicted with palsy. But now he would not yield to his weakness. He fought it down, trod on it, and, living on his spirit, he dragged the canoe forward. He must pass the Forks before Standifer reached it, or the whole flight might end in disaster; for once the scoundrel learned the truth he would be certain to haunt the neighbourhood, and search every likely hiding-place until he had found Norma. In which case the girl might as well have remained in the encampment by the sea.

Urged by that thought, with many intervals for rest, he slaved on. There were times when all that he did was merely automatic, when his will seemed almost overborne, but still somehow drove his body forward, and with it dragged the canoe; stretches of time when the inanimate things that barred his way seemed to quicken to life and become active personal enemies, assuming a malignancy that tried his soul to the verge of madness. The throbbing of his head increased. Under the strain the swelling of his bruised throat appeared to be increasing; there were many minutes when his breathing was a mere succession of short gasping intakes; and there came a moment when, stumbling over a rock, he saw the world in which he moved spin and whirl before his eyes, and then suddenly vanish in darkness.

How long he lay in the unconsciousness that followed that fall he never knew. When next he became aware of his surroundings, it was to find himself lying in soft mud, with the canoe, anchored by his body, bobbing at the end of the tow-line. Painfully he picked himself up, and stood for a moment reeling like a drunken man, nothing but his dead weight holding the canoe in leash. His hand went to his head. There was something that he wanted to remember. What was it? For a time his brain withheld the information, and then quite suddenly thrust it on him. 'The vodka!'

That would brace him, would keep him going with its fictitious strength until he reached the Forks, where he could rest and wait for whatever was to follow. Weakly he began to haul in the tow-line, and when the canoe was beached helped himself to a liberal portion of the spirit.

Almost immediately it stimulated his flagging energies, and he moved forward once more, unconscious of everything except the urgency of reaching the main river at the earliest possible moment. There was an odd drumming in his ears; black specks danced before his eyes, and his heart seemed to be pounding like an engine. Yet he kept on hour after hour, with briefest spells of rest, feeling like a man

condemned to everlasting labour, from which there was no possible escape. Then a little cry of thankfulness escaped him. 'At last—thank God!'

Before him, like some fortress of the wilderness, was the great wedge of rock which divided the flowing waters. Ahead opened the wide valley along which ran the other fork of the river. Eagerly he surveyed the scene that opened to his gaze. In all the expanse nothing moved except a flock of birds circling above the marsh, and on the reaches of the river there showed nothing except a few gray geese. His head whirled as he stared on the empty land. He was utterly exhausted by his labours, and the need for rest was imperative. His shirt was soaked with the sweat of his endeavours. He was wet to the waist through splashing in the shallow places of the river when the bank gave no foothold for tracking; but he did not light a fire, since the smoke would indicate his presence to any one coming down the river, whether foe or friend. Before rolling himself in a blanket he fired his rifle twice, and listened eagerly, hopefully, for response. None came; and, with a little gesture of disappointment, he lay down among the bushes where he had cached the canoe. Scarcely had he done so when the sleep of utter exhaustion fell upon him.

(Continued on page 197.)

THE EBB-TIDE.

SING to me softly, here in the twilight, here as
the dusk falls low;
Sing me the songs of those far-off places, lands
that I used to know.
Sing me a song of the sea-wind whining,
And a song of the foam,
For the ceaseless beat of the surf is calling,
Calling me home.

Let your song be of southern palm-trees, under
a tropic moon;
Of starlit sands and a coral reef that borders
some far lagoon.
For the years I have lived are many
(And good years they!)

In the South Pacific, that knew me well
In yesterday.

Then sing of the East and the sunrise, aglow on
the China Sea,
Of the years that are lost in the shadow, and the
youth that is gone from me;
And sing of the tide in Fundy,
Where the west wind sways;
And sing of the cold north icefields
Of other days.

And then, as the twilight changes to night, let
your singing die,
And leave me alone with my fancies, alone while
I bid them good-bye.
One by one they are fading softly
With twilight's glow,
Fading into the silent shadows
Of long ago.

CONSTANCE M. TROY.

FALCONRY: A DAY WITH THE HAWKS.

By N. M. GUNN.

I.

IN name at least, history and, more particularly, historical romance have made the duller of readers familiar with the sport of hawking. Back into obscure antiquity it has been the relaxation of the privileged great, the true 'royal and ancient' sport. To international contests of skill in the field, royal recognition was given by James I. of England and VI. of Scotland when he invited French nobles (then past-masters in the art of hawking) to compete in friendly rivalry in hunting and hawking with his own subjects. Richard of the Lion Heart, while in the Holy Land, amused himself, we are told, by hawking on the plain of Sharon with hawks brought all the way from England. Even Archbishop Ælfric in his *Colloquy*, written in the tenth century, makes mention of the sport. It is perhaps more than a comment on the evolution of our civilisation that the descriptive epithet, 'royal and ancient,' when applied to Scotland's great pastime of to-day, draws the mind, not to the hooded falcon, perched on lordly gauntlet, but to the greensward of S'n' Andrews and the inoffensive flight of the wee ba'!

Although I knew hawking had been pursued in comparatively recent times in Scotland, I was under the impression that to-day the sport was altogether dead. It was, therefore, not without a certain amount of excited interest that I learnt of its keen pursuit on a Caithness moor, and learnt also that the gentleman who was thus discarding the deadly, hammerless, ejector mechanism for the lordly peregrine followed in direct descent of courtesy the ancient sportsmen.

My luck was in. It was a beautiful early October morning with a breath of sou'-west wind when I reached the lodge, an unusually fine day in a somewhat stormy season. Caithness moors are notoriously wind-swept, and a high wind, for many reasons, is little use for hawking.

'Would you like to see the hawks?'

I followed the falconer to a small clearing amongst some shrubs, and in a moment was aware of pairs of round, unwinking eyes fixed on me, of curved beaks, firmly planted legs, greeny-yellow scales above wide-spreading talons, and, more than all else, a magnificent immobility. Nothing here of fear or of truculence; only an impression of sheer nobility that defies definition, an unwinking deadliness of regard that may not be outstared. And we had surprised them after their baths, too! Their feathers were still wet.

The sudden spell of silence was broken by what was obviously the small bird of the lot jumping off its wooden *block* and flapping and struggling against the leather leash that I now perceived was used in each case as a sort of tether from the legs to the block. Each bird had its rounded block, a foot or more in height, set far enough from its neighbours to prevent mutual interference. But what struck me immediately, and now remains as one of the pleasantest memories, was the music of the bells, two spherical brass bells attached to legs and leash, that rang with every movement of the falcon.

This comparatively small bird, I was told, was the 'tiercel,' that is, the male falcon. All the others were females, much larger birds and of an altogether finer dignity. In front of their lord's clatter they remained absolutely unmoved and unheeding. It is a noteworthy fact that in all birds of prey the male is smaller and less powerful than the female.

II.

The weather was considered, the direction of the wind with regard to the slope of a hill, and, generally, all that weather and moor lore means to expert hawking. At last a particular beat was decided upon, but just as we were getting ready for the road a rabbit rushed squealing across the lawn, with a stoat stuck in its throat and floating as a dead, reddish-brown streak along its side. In an instant the spaniel was on the scene. The stoat relinquished its game to the spaniel and made off, but no sooner had the rabbit redoubled its squealing than back rushed the stoat to within a few feet of the scene, stood up stiff as a poker on its hind-legs, and shot its angry nose forward. A shout was given for a gun, and, as though divining the intention, the stoat made reluctantly again for the ditch.

The falcons now appeared, perched on the padded edge of a rectangular frame which fitted exactly into the boxed rear-end of a car. But now there was no longer the unwinking stare, for each falcon was hooded. It was an arresting change, and I presently gathered how all-important. At the moment, the hoods themselves claimed attention. Made of leather, and cunningly shaped to fit the big skull of the bird so as to exclude light without pressing on or hurting any particular spot, they were tied round the neck by a very ingenious arrangement of short leather thongs or *braces*, one pair for opening the slit in the back of the hood and the other for closing it. This hood, with its mediæval air and gay upstanding

feather plume of brilliant red body, seemed certainly to gather to itself not a little of romantic glamour; and always, protruding from a slot in the head-piece, the hooked beak as ineffaceable sign of nobility!

Our destination reached, the falcons were unhitched, one by one, and lifted onto the edge of a lighter framework, or *cadge*, that could be carried easily by one man stepping into the middle of it and lifting the whole up, birds and all. And now I began to appreciate the real significance of the hood, for so long as each bird is hooded there is not the slightest attempt made by it to leave its perch. Needless to say hawks are never lifted as one would lift a hen or any such feathered plebeian! Over the left hand is drawn a leather gauntlet, and on this the hawk is perched, the leather protecting the hand and wrist from the claws. In this way the hawk may be carried quietly for any distance. The hood, it seems, is the key to all hawk training, and its proper use, from the moment the wild bird is caught, is very important.

Leaving the road we got on to the moor, and presently, half-turning, moved directly up-wind.

The sport was about to start. The usual practice is first to get a point from the dog, and then to put up the hawk. As the season wears into October, however, and the grouse begin to get a bit wild, it is often advisable to send the hawk up first, especially if it is almost certain there is game within no great distance, for whenever the hawk is up feathered creatures crouch close, trusting in their gods of immobility and protective colouring.

'I think,' concluded my host, 'I'll put up Lady Jane.'

Lady Jane was accordingly unleashed and transferred to his gauntlet. He walked on a little way, looking around to see that the dogs were in their proper place. Then, bending his head, he caught in his teeth one end of the opening pair of braces, in the fingers of the right hand the other end, and pulled; the slit on the back of the hood opened, the hood itself was slipped off the falcon's head with a deft movement, and with a sweeping, forward motion of the left wrist, Lady Jane was gracefully *cast off*.

A flap or two, and she flattened out her long wings and volplaned the arc of a circle, recalling instantly to mind the taking-off of a monoplane. The likeness was increased when, floating from her folded legs like wireless feelers, were seen the six inches or so of two soft leather thongs (the *jesses*—for fixing to the leash), and for drone of engine was heard, every time the powerful wings beat, the faery tinkling of the bells.

III.

A short reconnoitring flight over our heads, and Lady Jane stood out across the gentle down-

slope of the moor. Farther and farther she went, till I felt certain she was off for good. Why not? Was not the wild instinct there in the curved beak and bold eyes; there, too, the love of great spaces, of great flights? It is not as though these hawks were the heirs of a long domestication; they were true wild birds, *passage-hawks*, caught in Holland when travelling southward from, it might have been, Northern Russia, it might have been this very moor—the true cosmopolitan peregrine. But Lady Jane, now very far out, suddenly wheeled to the left and began beating up again in a great circling sweep.

'She's coming back!' I vouchsafed.

My host smiled.

'I like to see them standing well away; generally means they will climb all the higher, and the higher the better.'

The music of the bells became louder, and in a little while Lady Jane was once more overhead.

A sudden whistle brought my eyes to the moor, and for the first time I became really conscious of the existence of the dogs—a half-dozen of perfectly trained setters. One had been unleashed and was covering ground up and down in front of the keeper, nose to heather, in fine style. It was when he had gone too far to the left that the keeper's whistle had brought him back. Down he came, but not too far, and presently he was reaching out to the left once more.

'Let him go!'—when the whistle again threatened.

And at that instant the dog stiffened, head slightly lowered and pointing dead up-wind, tail standing straight out in a line with the taut spine—a thrilling masterpiece of canine statuary.

The faery bells again beat round in a circle. One could feel doom creeping in on the crouching quarry. But in actual life things rarely rise to the perfect climax.

Suddenly a somewhat disappointed voice: 'She's not climbing very high to-day.'

It was indeed as though Lady Jane, on such a perfect day, felt she could dispense with the power that height gives. Though at a fair height, she circled round our party without noticeably climbing. It was decided to give her her chance.

The keeper had now hold of the dog. When the hawk circled up into the wind once more, he got a shout to flush the game. Forward he went with the dog, having almost to pull the beast by the collar, as though it had become hypnotised by its own concentration. It took a second or two more than was anticipated to rouse the game, and in that second or two the falcon had wheeled round on the off course. With a flurry of wings the grouse was up. A sudden shout from my host, and Lady Jane cut

round in a flash and was *stooping* at the quarry with incredible speed. The race did not last long; there was an impact, some feathers in the air, and the grouse dropped.

'Not badly hit, and there's cover in that ditch!'

It was even so. Some whin bushes and old heather made excellent cover. When we came up, Lady Jane was very awkwardly hopping about, looking for her lost quarry.

IV.

I was now introduced to another of the mysteries of hawking—the *dead lure*. It was necessary to call the falcon off in order that the little spaniel—all this time kicking up a great fuss and straining chokingly at the leash—might be sent into the cover to get the grouse up again.

The *dead lure* consists of an arrangement of feathers and flesh tied to the end of a piece of string. In the earlier stages of its training the hawk has been taught to come to the lure—always with some profit in the way of a juicy morsel to itself. Deftly the falconer whips the lure out of his pocket, gives it a whirl round, and ere he has quite concealed it again the falcon is circling round him. Up and up goes Lady Jane, but now in narrow, watchful spirals, climbing steadily. Presently the spaniel is unleashed, the grouse put up, and this time there is no mistake. It is cleverly done, too, and not a matter of sheer strength and wing superiority, for the falcon, flattening out from her nose-dive, cuts across the chord of a circular swerve and intercepts her quarry in its very attempt to dodge. This time the grouse does not drop. The powerful talons have been driven home, and for a matter of about three hundred yards Lady Jane, pinions outstretched, carries her kill, though its weight is not far short of her own, before she drops with it to a spot whither the falconer, with hood and gauntlet, proceeds to recover her.

My first kill, and I found myself not a little excited. There was nothing here of the deadly blazing away of the guns, with birds falling right and left; nothing but quietude—except for the pleasant tinkle-tinkle at each wing-beat. It seemed, too, a game staged for wild life with man placing the players cunningly, but always with a view to his own profit, as the primal hunter had had to do. For, after all, man's brains are older than high-explosives.

But as life is more incalculable than mechanism, so every flight of a hawk has a new and uncertain element about it. We discovered this on the very next flight.

V.

A young falcon was chosen, with back feathers still of the dove-brown colour of its first year. (The feathers on the back of Lady Jane's wings

were bluish, indicating that she was a trifle beyond the *débutante* stage.) A fresh setter was unleashed, and got a point almost immediately. The young falcon was unhooded and put up. The sport was going to be plentiful and swift. Entered the incalculable element.

The young falcon (I forget her name) flapped, volplaned, climbed, and then headed directly away down the moor. Immediately my host became unsettled. He whipped out his glasses and got on the bird. In a moment she would turn as the first had turned, I thought.

'She is bearing straight away; fly the lure!'

The *dead lure* flashed round on its string.

'The *live lure*! The *live lure*!'

And now I was introduced to the second lure, for there are two. From a receptacle slung to his side the falconer produced a live pigeon, and threw it into the air. It did not fly very far, for attached to its legs was a long piece of string, the end of which the falconer held. When the string was run out the pigeon fluttered to the ground. Usually the white pigeon attracts the falcon unerringly, and the use of the live lure has to be resorted to on many varied occasions, for the study of how a falcon, out to kill, may behave on a moor in the presence of life of any sort—even shooting parties putting up grouse miles away—is a complicated one.

Meanwhile the aristocratic *débutante* pays not the slightest attention, but heads steadily for a small farm, that has been recovered from the moor, about a mile away. Occasionally she swerves and dips, as though some small birds were mobbing her. I lose sight of her.

'She is over the farm! She is down!'

There is not a little exasperation, but there is a greater fear, I can see, of losing the falcon altogether, for this occasionally does happen. Anyway, there's nothing for it now but to set out and recover her. My host and the falconer get back to the car, and are soon heading for the farm. A cryptic remark from some one at my back raises a reflective smile. 'I hope it's not another duck!'

With a pair of glasses I get on to the farm. I notice some gulls flying lazily. Corn is being cut with a reaper. Golden stooks stand in sunny rows. Life is moving about the place unhurriedly. Something ideal about the whole scene strikes me, and I drop the glasses. What a magnificent, far-stretching prospect! Away to the south lie the long-backed Scarabens, and to the right of them the peak of Morven, the highest mountain in Caithness; farther west, through a diaphanous cloudy veil, comes dimly the noble outline of famous Ben Loyal; while to the north, looming out of the horizon's mists like the outlines of gigantic battleships, are the Orkneys. This I consider the finest stretch of moorland scenery in Scotland—and that though I have seen a great harvest moon play 'hide-

and seek' amongst the peaks of Ben Doran when tramping the Moor of Rannoch in the dead of night.

I am recalled from reverie by the keeper, who at this time has been on his back with his long telescope on the farm.

'They've got her,' he said, with all the quiet air of certainty of a gamekeeper.

VI.

We are soon all ready again. A fresh falcon is unhooded and put up, and now I see the finest flight of the day. It was really a splendid piece of work by a falcon that was obviously as conscious of what was toward as the eager setter, his five restless companions in a perfect fever of excitement, and the quivering little spaniel, still painfully anxious to show that he could do the whole job himself. After standing well out, she heeled over and came back climbing steadily; sweep after sweep, spiral after spiral, ever watchful and ever climbing; at each wing-beat the music of the bells, at each wide-winged sweep to wind, silence. And the higher up, the narrower the spirals. Directly overhead, up and up, slowly but steadily. On a wave of excitement came the fervent desire that nothing now would interfere to attract the falcon's attention elsewhere. And nothing did.

At last it could be seen the hawk was *waiting*. The order was given to flush the quarry. I kept my eyes on the hawk, now of insignificant dimensions against the blue. Then I found myself shouting in sheer excitement, 'Hoi!' in concert with my host, as the grouse was put up—a rousing cry that I now tentatively try to render phonetically, for I very much misdoubt my ears at such moments of visual stress. Only that the cry, like the hoods, had its air of mediævalism.

I don't know that I have ever seen anything more thrilling than the rush of the falcon to earth. She came, wings closed, like a bomb, a lateral bolt from the blue, with a whizzing in the air that sent a shiver down the spine. I held my breath before prospect of certain catastrophe. But with all the perfect mastery of this crowning genus in the family Falconidæ she flattened out behind the grouse, and shooting forward with terrific velocity on outstretched wings, struck the quarry and dropped it like a stone to earth. Instantly she banked, looped the loop sideways, and dived to her kill.

I knew now that I had seen a sample of the finest hawking as it has been practised from time immemorial, and I was beginning to understand a little the art of falconry. The incalculable element in it, the intervention of intelligent life-force, made it unquestionably fascinating, apart from any considerations historical or otherwise. Whether I was in luck's way in that I was destined this day for a variety of

incidents I cannot say, but certainly there was no flight that was in any way a duplicate of any of the preceding ones. The very next, though not so compact of sheer thrill, was yet very exciting, for the quarry was an old cock-grouse, and no more need be said to those who understand the surpassing cunning of these old tyrants of the moor.

The old cock, with characteristic wisdom, had got up of his own accord whilst the young falcon (the *débutante* on second trial), beginning to climb in very wide spirals, was at that part of her circle most remote from him. She at once stooped in a magnificent long slant right over our heads. The cock had a long start, and the falcon's wings were brought into play. As it is stated these peregrines have got across Europe at an average speed of over 100 miles per hour, it may be understood that the old cock had not much chance. He was soon overtaken, and though he dodged, seemed to be struck, however slightly, and certainly dropped into a second ditch where there was plenty of long heather. Then began the hunt; for the whole point of the sport is that the hawk must kill, not merely that the grouse be caught. A falcon is of little use in pursuit unless on the wing, but a grouse is very nimble on foot. The old cock knew his advantage. Frequently, I understand, under natural conditions, these wily cocks fly and drop, fly and drop, taking advantage of all cover, till at last they reach a spot where, by lying perfectly still, they are safe from further pursuit. This old cock was ultimately got to the wing, however, and an exciting hunt ended in victory for the *débutante*.

VII.

At lunch-time I was introduced to an outline of the history of falconry (anterior to the Christian era) and to the interesting and human art of training these passage-hawks by a sportsman who, as I had observed, knew the practical exercise of the sport itself to its minutest detail. These sportsmen not only know the idiosyncrasies of every falcon they possess, but can tell at long distances each falcon by name merely by observing its flight, just as fisher-folk can distinguish sailing-boats at sea by the cut of their sails. Indeed, in falconry the wings of a hawk are termed *sails*. This sympathy between a sportsman and his hawks is very real, and not without its appeal even to the case-hardened modern.

I have heard it said hawking is a cruel sport. Such a dictum merely leaves one cold, especially in face of fox-hunting, hare-coursing, otter-hunting, pheasant-driving, and so on. All hunting, all killing, may be looked upon as cruel. Not a day passes but dishes come to table that, if you like, might give pause to merciful humanity. But until such pause, hawking may be regarded as a game that, without any inter-

ference from man, is being carried on under natural conditions of wild life every day the sun rises on the whole problem of the balance of power in Nature. Witness the incident of the stoat and the rabbit. Whether hawking as a sport will revive in these islands is another matter. In view of the increasing greatness of scientific knowledge and of mechanical skill, it is not considered likely. And yet is it not

conceivable, if man will go on eating flesh and refusing to inherit the utopias from More to Wells, will, indeed, give ear to the philosophers who unwind their mediæval horns on the heights of Notting Hill and drink nutty beer at strange inns, that he may, in the years, swing back from the tyranny of mechanism—if not in his work, then in his sports at least? After all, it is the incalculable that thrills.

THE WHITE HERD.

PART III.

VIII.

I GLANCED in the direction of the herd.

It was now gathered in a compact mass not a couple of hundred yards from the fence which divided pasture from pathway. Chill with dread as I was, I could not refrain from admiration of their glossy, snow-white coats, their tossing, horn-crowned heads, their dark and flashing eyes. There they stood, snorting and pawing the turf, and as they saw us approach, one of the old bulls raised a bellow which was caught up by half the herd like a fanfare of trumpets.

With the careless whistle that I remembered from the night before, Rupert Bolding vaulted the fence and began to walk in the direction of the herd, as a drover might advance towards domestic cattle. As he did so I saw the crowd of great beasts, agitated as by a single impulse, break and fly madly away from him. He laughed triumphantly, and turned to the knot of keepers with a leer.

'He thinks they're runnin',' said one of them. 'But let my gintleman wait a minute. Look, see!'

As he spoke the herd turned, and came sweeping backward in a great curve. It is a peculiarity of the ancient breed of wild cattle of these islands that they invariably approach an enemy in circles, and I now saw that they were making a moving ring round Ralph Bolding, the radius of their wheeling gradually lessening. But he stood motionless, with set, white lips and folded arms, although I could see that the first hint of his real danger had come to him.

'By the powers, but he's a rale man, Boulding or no Boulding,' said one of the keepers. 'Sure, bhoys, it's murder. Cannot we get him out of it?'

'For God's sake do, men!' I implored. 'Use your guns. Pick off the leader, and the herd will come to a standstill. Then he'll be able to slip out of that devil's ring they're making round him.'

Helga Bolding flashed a dark glance at me. The men saw it and murmured.

'And is it shoot the white bastes, ye would?'

said a man at my elbow angrily. 'Do ye not know that when a man in Joyce's Country dies his soul——'

'Miss Bolding,' I cried, 'this is horrible!'

'It is vengeance,' she said in tones of ice. 'He deserves death. I told you—of the papers I found.'

The circle had now narrowed so much that the leading bulls were close upon their quarry. They moved with the swiftness of wild things. All at once Bolding was galvanised into action. I saw him strip off his jacket, and, as the nearest beast charged him, flourish the garment in its face as a toreador might at a bull in the ring. Nimbly and with surprising dexterity he avoided the clumsy rushes of the now maddened brutes, flaunting the red-brown tweed before their eyes. It was the last flash of a proud, reckless spirit, dying as it had lived, in bragadocio. At last, eluding the charge of one of the white monsters, he essayed a cowboy trick which drew an involuntary cry from those who stood watching him with strained eyes and shaking limbs; for, even as he avoided the beast, he placed a hand on its withers and made to vault upon its back as if it had been a mustang. But the trampled and treacherous footing on the turf failed him, and he went down among a sea of heaving backs and tossing heads.

I closed my eyes. There was a bellowing as of primeval monsters, and I will swear that I heard a laugh ring out—mocking, almost triumphant—a scornful laugh from a wicked, reckless heart. Then the herd swept on.

IX.

Some days later, as I was preparing to leave Joyce's Country, a strange man came to the cottage.

'I am Inspector Devon of Scotland Yard,' he announced without preamble. 'I am afraid I come on unpleasant business, Mr Dean. I have here a warrant for the arrest of one Rupert Bolding for the murder—the very cold-blooded murder—of John Gregory in Burma, but I have just learned in the village that Bolding has been killed as the result of an accident. I don't

care, in the circumstances, to go to the castle, and they tell me you know all about the business.'

'They referred you to me?'

'Yes, sir. Of course, I know your name well. Fond of music myself. Your word will suffice—'

'Yes, there was an—accident,' I told him. 'He murdered a man, you say!'

'They quarrelled over the loot they made as ivory poachers, and Bolding shot him in his tracks up-country. This is our man, is it not?'

He held out a photograph.

'It is,' I said. 'I may tell you we all thought him an impostor. It was even hinted that he was a man who had murdered Rupert Bolding. Neither of his ears was maimed, as one of Bolding's was supposed to be.'

'His ear maimed?'

'Yes. It seems that he wrote home to some one and mentioned a maimed ear.'

'That's queer,' said the inspector. 'My advices are a bit muddled, like most of those colonial police communications, but they state that the man he killed was so marked. Perhaps Gregory found out that Bolding was heir to Castle Bolding, that no one here knew what he was like, and made up his mind to return and impersonate him. Bolding may have penetrated his purpose, and killed him. They are described as a wild couple—a pair of desperados, in fact. Well, we'll never know now. How did he come to be killed?'

'He—he recklessly ventured out among the wild cattle in the park down there. He was trampled—gored to death.'

'Indeed!' The man was eyeing me hard. 'The people in this neighbourhood are a tough lot, I understand. Mark my words, we'll have trouble in these parts, Mr Dean, and that before

very long. I can take it from you, then, that my man is beyond the reach of justice?'

X.

It was a March afternoon some months later, and I had just retired to an anteroom after conducting my 'Tartarus' symphony. The concert was still in progress, and the crowd of my congratulatory friends had not yet swept in upon me. But as I was packing up my scores I heard a step in the corridor outside, and some one entered. Helga Bolding stood before me.

'I must congratulate you,' she said, with outstretched hand. 'It was splendid. It was—Joyce's Country.'

'Yes, Tartarus,' I agreed.

'Oh, I felt it was my own land,' she cried passionately. Her voice had taken on a quality strangely soft, and her cold, blue eyes were moist and dreamy with longing. 'I heard the wind crossing Partry, and saw the black heads of the hills,' she crooned. 'I am going back there—soon.'

She moved me strangely, this fair, cold woman. I felt the resurgence of a passion I had thought conquered. 'You return to Joyce's Country?' I said, retaining her hand, which rested in mine like a lover's.

'Yes. Will you not be coming there too?'

There was a wooing note in the stern, deep voice. But the phrases of doom from my own symphony were still in my ears. Something suave, Latin if you like, awoke in me, something deep as the springs of civilisation, of order. And I remembered the words of Kelly, 'A sthrappin' colleen, but a grim.'

My grasp on her hand relaxed. 'No,' I said, almost harshly, 'I shall not be coming to Joyce's Country any more.'

THE END.

THE ISLANDS OF FLOWERS.

By W. SLATER.

ACRES and acres of beautiful flowers growing at Christmas—that is a spectacle none would think to find in any portion of Great Britain, yet it is a scene which regularly greets the eye of those who care to seek it. While the people of the United Kingdom, generally, are nursing colds or doctoring chilblains, and wishing that the fog and sleet would cease, one small section of the people—the residents of the Scilly Isles—are busy with their flower-farms, picking and preparing blooms for the London and Scottish markets.

Though only twenty-five miles west-south-west of Land's End, the Scilly Isles know nothing of our English winters. Their climate is mild and equable, and the soil is admirably adapted to the cultivation of flowers, especially

of the early varieties. Flower-farming is, in fact, the only industry of the residents. All kinds of blooms are grown—narcissi, daffodils, geraniums, marguerites, lilies, wall-flowers and anemones, and from Christmas until the end of April, or even into May, a hundred tons of flowers are shipped each week to the mainland, to be distributed amongst the inland markets.

The flower industry of the Scilly Islands is perhaps the largest in the world, yet it had a very small beginning. Forty years ago it was unknown. The residents were poor and workless; fishing had failed, shipbuilding, which was once a feature of the islands, had been killed by the introduction of steam navigation, and potato growing, which had seemed to offer possibilities, was crushed by the

competition of the Channel Islands. The one thing the islands could grow, apparently, was flowers. Hundreds of thousands of narcissi, the common Scilly whites, bloomed each year, and were allowed to die unnoticed. Nobody suspected their value; then, Mr W. H. Trevellick, of Rocky Hill, St Mary's, sent a few bunches, by way of experiment, to Covent Garden. The result was astonishing. A high price was paid him, and an order sent for more. His success stimulated others. The wild flowers were all sold, and the cultivation of the blooms, to increase their productivity, was taken up by all classes. New varieties were introduced, and to-day something like 200 distinct varieties of flowers are grown by the Scillonians, and the islands supply the markets of London, Glasgow, and Edinburgh, as well as many other towns, with flowers all through the winter.

The bulbs are planted in specially prepared beds, in rows from six to nine inches apart, and the beds are renewed every third year. Bulbs allowed to remain too long without being lifted would send up feeble and barren shoots, but the frequent renewal of the beds retains the full vigour of the plants. The plants really require little attention, beyond being kept free from weeds, sheltered from the winds, and the application of an occasional top-dressing of stable litter or freshly gathered seaweed, the latter being plentiful about the coast. The beds are sheltered by wattle-fences, or dwarf hedges of escallonia or veronica. The flower-gardens crown each slope and ledge, and every coign of vantage is appropriated for them. When the season is in full swing, millions of flowers of every shape and shade almost cover the land. Pepper-and-white narcissi, golden daffodils, and a sprinkling of other blooms give one, at a distance, the impression of looking on a carpet of white and gold.

The flower-harvest begins at Christmas, or directly after, according as the season has been favourable or otherwise, and from the start practically all the inhabitants are busy in the fields. The picking is done by women and girls, who each carry large baskets slung from the shoulder, and move about amongst the beds selecting blooms most suited for the market. The flowers are plucked just as the buds are opening, and the blooms are tied in bunches of twelve, and then dipped into shallow trays of tepid water. The object of this treatment is to develop them and keep them fresh until they are packed. The bunches are then carefully packed in rough wooden boxes and hurried off to the quay for shipment to Penzance, whence special trains carry them to London in time for Covent Garden market. The steamboats sail on Tuesdays, Thursdays, and Saturdays, and on these days everybody in the islands is in a state of almost breathless hurry, seeking to get off as many blooms as possible. Last year

a hundred tons a week were sent for many weeks, and the income from their sale must have totalled many thousands of pounds.

The Scillonians have the great advantage that flowers bloom in their islands even before they do in the Channel Islands or the south of France, and they are always first in the market. That explains in a large measure the rapid growth of the industry. In 1887, the earliest year for which reliable figures are available, the total export of flowers for the season was just 100 tons. Twenty years later it exceeded 1000 tons, and last year the output must have been close upon 1500 tons. Think what that means! One flower, daffodil or narcissus, will weigh perhaps one ounce. Suppose twelve blooms are required to weigh one pound; then, to export 1500 tons, between 40,000,000 and 50,000,000 flowers must be grown.

While narcissi are the speciality of the Scilly Isles other blooms are equally popular as the season advances, and one of the great features of the Scillonian flower-farms is the beautiful arum lilies which are grown. These pretty flowers are grown in the open, in narrow trenches to shelter them from the wind. When picked, each bloom is wrapped in cotton-wool and carefully packed for its long journey. The flowers are in great demand early in the year for Church decoration, and when Easter happens to fall early, and only Scillonian lilies are available, some astonishingly high prices are attained.

Nowhere else is the flower industry carried on on such a scale; every inhabitant of the islands is practically dependent upon it for a livelihood; and it is the flowers which have saved Scilly from poverty and ruin, and made its people a prosperous community.

PENSIONED.

OUT of the stinging, stifling heat,
And the raucous shriek of wheel,
Grindstone and file and the deafening beat
Of hammer on clangorous steel;

Away from the toil in the dust and smoke
And steam and the acrid smell
Of sulphurous furnace-fumes that choke
The lungs, I have come to dwell

In the hamely clachan once again,
Where the Bervie skirts the corn—
To watch from my window the falling rain
Glisten on birch and thorn;

To walk, when the winds from the fields blow
sweet,

Under the smokeless skies,
Feeling lush grass beneath my feet,
Its comfort in my eyes;

To hear the songs that the breezes sing,
And brook and bird and bee,
Breathing the incense of nectarous spring
From flower and furze and tree.

God, be it mine my path to vend
In woodland ways to my journey's end!

WILLIAM DOUGLAS.

ATAHUALLPA'S EMERALDS.

By E. CHARLES VIVIAN.

I.

SHAW and Kennett landed at Guayaquil, because there is no such expensive traveling in the world as that down the west coast of South America, and they hoped to add to their funds by some means in the equatorial state. Anyhow, they judged, it would be better to land and take a chance while some small means of looking about remained to them, than to book on to Iquique and arrive penniless. They knew that the chances for an Englishman in a nitrate port are small, while Guayaquil might yield up anything, from yellow fever to fortune. They were young, and therefore hopeful; Colón had been good to them, Guayaquil might be better.

It was hotter, and more moist. It yielded up (at the office of the American consul, a day after they landed) a skinny man from Virginia, who carried quinine loose in his vest pocket, and took pinches, licking the stuff off his fingers with relish, in intervals between smoking maize-leaf-wrapped cigarettes. He said his name was Bates; he called a mule a 'mewel,' a revolver a 'gun,' and a man a 'guy'—over this last Shaw nearly quarrelled with him, for the humid heat made tempers short.

'I've got a tolerable proposition—soot guys like you, right slick,' Bates announced. 'It's emeralds.'

'From here to Bogotá you can pick up an emerald yarn every other mile,' Kennett remarked: he had made that journey, and knew.

'My proposition is as different from the average yarn as a mewel is from a flea,' Bates said calmly.

'Yes,' Kennett drawled, 'they all are.'

'Say,' Bates remarked, after he had licked a pinch of quinine off his fingers, 'ef you two guys are jest jokin' me, say so, an' I'll waste no more wind.'

Shaw subsided into a cane rocker. 'Mister Bates,' he said, with weary irritation, 'I'm not a guy, and my friend is not a guy. If you're looking for financiers or dead-beats, we don't fit in either case; and if you've got a good thing to make up a party on, state it. I'm all ears.'

'You don't look it,' Bates answered. He signed to a small boy and gave an order; three glasses appeared, and in them ice tinkled pleasantly. Bates took a rocker beside Shaw.

'Way up back'—he jerked a thumb inland—'there's a little ranch in a pocket in the hills, cattle an' corn an' mewel pack for supplies. Run by old man Hackett—a little bit cracked, that Hackett; one of the Hacketts out of Mobile, an' they're all more or less woolly under

the lid. Came out here prospectin' near on thirty year ago—an' there he is, settled down an' fixed.'

'Well?' Kennett asked.

'Emeralds,' Bates answered, and left it at that.

'I don't see the connection,' Shaw remarked, after a pause.

'I been up there,' Bates said. 'Hackett's got a daughter, an' she wears 'em. She's got a necklace that would drive Cartier's crazy, an' a pendant—emeralds—that would buy half Guayaquil. Hackett don't know they're worth a tenth as much, an' he don't care anyway—satisfied to live up there away from folks—gets books up by pack mewel with his stores. It's the maddest thing outside fairy tales. But there's some lots of emeralds somewhere round there.'

'Cut stones?' Shaw asked, with obvious incredulity.

'You kin search me,' Bates answered imperturbably. 'I might go up alone again ef it amused me, but it don't—the trail's no picnic path. I've got an option on mewels, an' outfits are easy—my pigeon. Come an' find where Hackett picks up his emeralds, fifty-fifty, me an' you two guy—gentlemen.'

'And supposing we don't find?' Kennett asked.

Bates considered it. 'You land back here, three months—six months,' he answered. 'Not a cent worse off, an' what's left of your outfits to the good.'

'We might get some shooting,' Shaw mused aloud.

'Rock snakes an' vizcacha,' Bates said carelessly; 'nuthin' worth skinnin'. But I'd been wonderin' where I'd find one good man to see the trip through with me—I could have bought dead-beats by the dozen ef I'd wanted them. But, you see, I knew some Mobile Hacketts, way back in God's country, an' I'd only take somebody up to this one so's I could say—"Hackett, here's a *man* I fetched along with me." An' I guess you two guys answer to that tally—I judge right off when I see.'

Shaw mopped the perspiration from his face. 'Game?' he asked Kennett.

'I could do with a three months' holiday, even if it does include a survey of the Hackett family heirlooms,' Kennett answered.

'Gentlemen,' Bates said solemnly, 'don't you mistake yourselves. Old man Hackett never brought stones like them outer Mobile—he found 'em or stole 'em up in the hills way back, round his ranch. Ef there's more, we win, an' ef there's no more, I guess I kin afford the trip, an' then some, though I'm no dollar king.'

'What are you?' Kennett asked suddenly.

'Me?' Bates said. 'I'm Bates from Virginia.' His thin lips shut like a trap on the last word, and he looked at Kennett in a way that proved the question an indiscretion.

'Well, Mr Bates from Virginia,' Shaw said, 'I'll chase your wild goose as soon as any other, and so will Kennett, I think. That is, if you want two companion adventurers.'

'Sooner have only one,' Bates said.

'Sorry,' Kennett answered, 'but it can't be done. We mess together, Shaw and I.'

'Then,' Bates drawled, 'I guess I'll haf to take two. Let's refresh.'

And the glasses were accordingly refilled.

II.

They remembered the heat of Guayaquil as a thing incredible, up in the Andine defiles beyond Alausi, almost under the shadow of Sangai's smoking crest. Here Bates left the main track which traverses Ecuador, and took them northward into the wilds, where, as Shaw put it, they had plenty of wood for fires, but precious little to cook.

There was a day when they panted above the snow-line, nearly on the equator, and Bates shot one of the four mules, which had broken its leg in scrambling over boulders. Then a second mule sickened and died of its own accord, and they lost a quantity of stores in crossing one of the snow-fed mountain torrents. After these happenings both Shaw and Kennett understood that Bates had cause for his reluctance to undertake such a journey alone; it was, as he had said, no picnic path. Bates himself turned greenish-yellow, and announced that his liver had gone back on him, but he'd see the gold-darned trip through or bust; and thus they came to the last evil, a glacier which ran transversely to their line of march, toward which they climbed wearily for two days.

'Say, boys,' Bates remarked, as they crouched together for warmth in the lee of a boulder, the night before crossing the glacier, 'I don't wonder old man Hackett sticks to his ranch. Guess I could do with a smell of Guayaquil now, to tone up my cussed liver.'

'I could do with a long whisky,' Kennett said, 'and a good hot bath, and a spring mattress with plenty of blankets.'

'I'll wake you up when you're through,' Bates offered dryly.

They tackled the glacier the next day. The crossing was not difficult, but from the farther edge the going was treacherous—the packed ice came down a ground-out gully of the mountains, and the channel was banked north and south by snow that was barely hard enough to give support. They came at last, some miles beyond the glacier, to a region of reeking mist, through which a little mountain torrent hurried, and the water was warm.

'Now I'm sure on the trail,' Bates announced. 'This hot creek makes us little more'n a day to go.'

He headed for a sugar-loaf peak, beside which a flat-topped spike of rock cut the northern horizon—the summits of both these landmarks were below the snow-line. As they came near a defile showed between the two heights, and they scrambled over and between ice-eroded boulders, often as big as the mules, to look at last on an Eden fairer for its contrast with the wastes through which they had travelled.

It was, as Bates had told them, a pocket in the hills, a circular level that might have been a vast, ancient crater of the Andine range, fully twenty miles from lip to lip. Down beneath them in the level of the sheltered, fertile valley was a squat and rambling dwelling of stone, evidently built—as are most houses in Ecuador—with a view to the possibility of earthquakes.

'Old man Hackett built it,' Bates announced. 'The near-by huts are for his Mapoche Indians—they date back to Huayna Capac, an' then some.'

'And his daughter?' Kennett asked.

'Sure, she's there, poor thing.'

'Why the adjective?' Shaw inquired.

Bates stuck two fingers in his quinine pocket. 'Some life—one cracked parent an' a handful of Mapoches,' he said. 'An' that with emeralds that would buy a city.'

He would say no more, but his two companions wondered. It was not the words, but the manner of the man, that convinced them of his knowing more than he told. So far, they had the bare outline he had given them in Guayaquil; in all the weeks of their journey he had not elaborated or added to that statement. Shaw had questioned him, but—

'Guess we'll see when we get through,' had been his response.

III.

By the corner of the rambling homestead sat an Indian woman grinding corn in a little hand-mill; in the doorway, leaning against the lintel, was a man thinner and scrawnier and taller than Bates, one whose straggling beard fell white-streaked for inches below his chin, while his bald head shone in the sun. He took a cob-pipe from between his teeth.

'Is that the same mule, Bates?' he asked, as if Bates had been just round the corner of the homestead and had returned.

'Not by a darned sight, Hackett,' Bates answered imperturbably.

The man in the doorway stood up away from the lintel. 'Guess you and your friends will want some sort of looking after,' he remarked. 'Come in and feed.'

He stood aside to usher them in. 'Lucy!' he called, and pointed to the mules. The woman by the corner stopped her grinding to take the

animals in charge, and Bates and his companions entered the house. In a room literally lined with books Bates introduced Kennett and Shaw to their host.

'Glad to see you, gentlemen,' Hackett assured them, in a way that told he meant it. 'I don't see a stranger every year, and so my tongue gets rusty. Hope you'll make a long stay.'

'How's Miss Hackett?' Bates asked.

'As well as ever,' Hackett answered. 'I'll fetch her and let her speak for herself.'

He left them, and returned with a tall girl—or woman—of such beauty that Shaw, young and impressionable, drew a long breath of astonishment at sight of her. She was dark as a Creole of New Orleans in the old days, with eyes that had in their depths a tragic sadness, and when she spoke her voice was music. She leaned on her father's arm as she entered, and even as she shook hands with the three she kept that touch on her father, as if shy, or afraid. Round her throat was a necklace of roughly fashioned links of gold, and in each link was set a great emerald. By that, Shaw and Kennett knew that Bates had spoken truly. Beyond this, she was simply enough dressed in gray linen, which seemed poor by contrast with the necklace.

She smiled at Shaw and talked with him—he was in his Saxon type a handsome man. Kennett, who was little and dark, she passed over with bare notice, and Bates she seemed to regard as an old acquaintance, little valued. Shaw talked to her until food was laid for the three of them, and then Hackett took her away again.

'What's the mystery—why are those two hidden away in a place like this?' Shaw asked Bates when Hackett and his daughter had gone.

'It ain't my story,' Bates answered. 'Mebbe old man Hackett'll tell, an' mebbe he won't. I sha'n't, anyhow. It's emeralds that I took this trail for.'

But already Shaw felt that emeralds were not the only prize the world held.

That night he discussed things with Kennett, apart from Bates, and came to no conclusion regarding the obvious anomaly.

'It's certainly a little paradise of a place,' Kennett said, 'but——'

'But,' Shaw continued for him, 'here's a man of obvious refinement, with all the wealth any man can possibly want, judging by those emeralds——'

'Shutting himself away from civilisation like a Crusoe,' Kennett concluded.

'And condemning a most charming girl to absolute solitude,' Shaw said. 'It's criminal.'

'Maybe—we don't know,' Kennett dissented thoughtfully. 'Supposing—I'm only supposing—Hackett had committed some big crime, and hid away like this to save his daughter from disgrace?'

'Suppose anything you like—he's no right to imprison her in a place like this,' Shaw snapped.

'We don't know—we don't know anything about it,' Kennett said.

'Why does he do it?' Shaw asked—not because he hoped for an answer, but to voice the question that had been in his mind since he had spoken with Joan Hackett.

'Why?' Kennett echoed sombrely.

In a week, waiting for Bates to broach the subject of the emeralds, they learned little. There was, Hackett informed them, an easier but much longer route than the one by which they had come, one which came out on the upper waters of the Magdalena in Colombia. That way came all his stores, and that way had come the piano which he kept in tune and Joan played. His fields grew most of the things he required, and the Mapoches were good workmen when one knew how to govern them. He told these and other obvious things readily enough, talked of the outer world as one who had travelled much and knew more than themselves, but he gave no hint of finding his solitude irksome.

'And your daughter, Miss Joan?' Shaw asked him one evening. 'Doesn't she miss society of her own age and class?'

'She'll never go out of this valley of her own will while I live,' Hackett told him; 'and she's not likely to miss what she has never known.'

'But she knows, through books,' Shaw urged.

'Guess you've read what the bottom of the sea is like,' Hackett answered; 'but you don't want to drown yourself, do you?'

Shaw gave it up then, and went on wondering. Also he spent an increasing amount of time with Joan each day—Hackett did not notice how youth called to youth, nor dream that those two were treading an old path to which there is but one end. Joan, as Shaw knew her, was infinitely attractive, the more so for the shadow that seemed always to brood over her, and that expressed itself in the sadness of her eyes. And, considering that he was the first white man near her own age she had ever seen, it was scarcely strange that he should win her interest and regard. Kennett, a harder and colder type, kept the possibility of emeralds in his mind; Bates, for whom both Shaw and Kennett had conceived a real liking by this time, seemed waiting his opportunity, and so far said no word of the object of their adventure.

IV.

The second week of their stay with Hackett was growing old when Shaw made two discoveries by means of his intimacy with Joan. They had been out together, and were returning through a field of maize that was taller than themselves, when he questioned: 'Where do you find such wonderful emeralds as those you wear?'

'I don't think them wonderful,' she answered. 'An old Mapoche got them for my father, years ago; they belonged to what the Mapoches call Atahualpa's treasure.'

Now the legend of Atahualpa's treasure is the great story of the Andine regions, from Lima to Cartagena, and Shaw paused, dizzy with the thought that the fabled millions snatched from the grasp of the conquistadores were proved real at last—for that necklace was ultimate proof.

'Where is that?' he asked.

She turned and pointed to the northern sector of the encircling hills. 'There,' she said, 'through the fields of sleep.'

'The fields of sleep?' he echoed.

'It is a shrub that grows in the fields,' she answered, 'and its scent is poison—so the Mapoches say. Atahualpa's treasure is laid in a great cave under the hills, and the people who laid it there planted all the fields round with this shrub, so that nobody can go near the cave.'

'But how did the Indian who got your necklace reach the cave?' Shaw asked.

She shook her head. 'My father could tell you,' she said. 'I only know that if you follow the main track through the cultivated lands to the north, you come at last to the fields of sleep—nobody ever goes to the end of the track, though. And if you know the way you might get to the cave, if it were not for the poison shrub. The Mapoches say that some day the Incas will come again, and then the shrub will be rooted out and the treasure taken back to Quito by its real owners.'

'I'd like to see you wearing that necklace in a London ballroom,' Shaw reflected aloud. 'There'd be some sensation.'

'I wonder what it would be like,' she said.

'Come and find out,' he suggested.

'You mean——?' she looked at him, frankly questioning, serious.

He lost consciousness of all things except that her sad and wonderful eyes were so near his own. She did not resist as he drew her close to him. 'You wonderful Joan!' he said. 'If I could make you understand how I love you, you'd come with me—Joan.'

'My dear,' she whispered, as they realised how time had slipped past them, 'I used to dream of what love might mean, but the dreams were never so sweet as this.'

But, when Shaw spoke of telling Hackett—this as preface to taking her out from the valley to the world as he knew it—she bade him say nothing yet. She had been as one transfigured in that hour of love's awakening, but now it seemed to Shaw that the shadow which brooded over her had come back.

'Let us keep our secret,' she asked. 'I want nobody to know yet—they will learn quite soon enough.'

And, since she seemed so earnest over it,

Shaw consented. It was Bates who, later that day, entered the house without warning or noise, and found her lying face downward on a settee, sobbing her heart out. Bates stole out as quietly as he had entered. 'Poor little gal,' he murmured to himself compassionately. For he had seen the drift of things, and understood.

V.

Bates, Kennett, and Shaw held a council over the story of Atahualpa's treasure cave, and it was decided between them that Bates should tackle Hackett over it; they felt that it would hardly be playing the game with Hackett if they made any attempt at finding the cave without his knowledge. And Bates, having tackled Hackett, returned to his fellow-adventurers with a sort of saturnine pleasure expressed on his lean face.

'It's as Shaw said,' he told them. 'There's a river that runs east, under the face of the hills—the far bank of the river is three hundred feet of sheer cliff, an' it's overhung. This side the river there's four miles of the poison shrub, an' no man can go half a mile in the shrub belt an' come back alive.'

'How did the Mapoche do it, then?' Kennett asked. 'How did he get those emeralds Miss Hackett wears?'

Bates shook his head. 'You kin search me,' he said. 'Ef you get at the back of a Mapoche mind, you'll know. Hackett don't tell, an' the Mapoches don't tell.'

'Then we're as far off as ever?' Shaw asked.

Bates shook his head. 'There's not a problem on this airth that ain't got a solution, ef you look far enough an' hard enough,' he said.

'Good medicine, Bates,' said Hackett from the doorway, 'but it don't always cure.'

The three turned to see him standing, shaking his head slowly as if to dissent. He came forward into the room. 'It's about time to put all the cards on the table,' he said. 'I knew why Bates came back here, an' I knew why he brought you two. He's come on what brought me, an' if I don't put all the cards out he'll be as I am, prisoner here.'

The three stood silent until Bates remarked, 'It's your deal, Hackett.'

Hackett sat down. 'I was a young man, rubbing down on the border, when I first heard of this valley,' he said. 'I went to Cartagena, got an outfit, an' came prospectin'. But up in Cartagena I met Dolores Escobar, an' married her. She took the trip here with me. They'll tell you yarns of Atahualpa's treasure anywhere down the west coast, but I believe I was the first white man to hear this yarn—the true one. I had proofs it was true, an' that treasure was to be my wedding present to Dolores. So we planned it, an' she came up the Magdalena—the happiest time I'd ever known. She was all any man could ask, was my wife.'

He paused, and the three held silence. He looked up from musing over his best days. 'We came, an' camped. There was Mapoches here, just as now, an' I got them into shape—shot one to show 'em I meant being master, an' after that I had no more trouble with them. Their head man confirmed the tale I'd had, an' he told me that if I liked I could find a way through the fields of sleep—it's easy, that problem. But it brings another. When you first go near the fields, the scent of the flowers on the shrub is poison, this way—he leaned forward on the table to explain. 'There's a gland in the throat of every man without which he can't live: it secretes some sort of fluid that's necessary to life, an' yet that fluid, if there's too much, is poison, just as too little of it's death. Breathing the scent from the fields of sleep doubles the secretion—it's a sort of gland in itself, that plant, an' if you go near it by degrees, an' breathe a little more an' a little more of the scent, till at last you can live with it, then you can get through the fields. But all the time you're killing the gland in your throat, an' that I didn't know.'

'So I went, an' Dolores went, up to the edge of the fields. We had a tent, an' we moved a little nearer, an' a little nearer, till in the end we could go in the fields an' through them, an' we both went through to the far side. There's Mapoches here that can go through the fields and bring back—what couldn't they bring back? I've seen what was hidden away, an' it's such wealth as no man has ever looked on, millions an' millions. My price of admission is that I stop for ever within reach of that cursed shrub, for if I leave this valley I die.'

'But——' Bates said, in an awestruck way. Hackett held up his hand.

'I wouldn't believe it, though one of the Mapoches told me,' he said. 'We'd spent months there by the shrub, Dolores an' I, an' then Joan was born—it was my mother's name, Joan. She was born up on the edge of the shrub, an' when Dolores was fit to travel with her we set to leave the valley. We travelled easy, to go out back by the Magdalena route, an' she sickened. Before we could get back within reach of the shrub she was dead, an' Joan an' I were near dead, too. I'll never forget what it was like first to smell that cursed scent an' draw back new life into my veins—for it was that.'

He looked round on the three, on whom—and especially on Shaw—the full meaning of all that he had said was dawning. He was prisoner for ever in his valley, and Shaw knew that Joan was prisoner too.

'That's why I say there is a problem that you can't solve,' he said. 'If you like, you three, you can go an' look at the treasure, an' the price you pay is that you never get out to the world again. If you stay here with me another month, though you're far from the

fields of sleep here, you'll be injured men for life: that gland in the throat of each of you will be dwarfed, half spoilt.'

'I aim to drop down from the cliff on the far side,' Bates said, 'an' so get at the cave without touchin' on the poison tract.'

Hackett shook his head. 'No,' he said; 'no man can drop down the cliff an' get back alive. It's in the heart of the scent, an' there is but the one way, imprisonment for life.'

Bates looked at his two companions. 'Well, boys, what say?' he asked them.

Kennett shook his head, and Shaw, who sat leaning forward on his folded arms, made no response.

'You could——' Bates said to Hackett, and paused.

Hackett shook his head. 'I shall never go near the cave again,' he said. 'If you don't know why, I sha'n't tell you.'

'Not for me, Hackett?' Bates pleaded.

'Not for you, Bates,' he answered. 'You can offer me nothing, for nothing in the world is any use to me—or to Joan.'

Shaw sprang to his feet as if he would protest, but instead of speaking paced up and down the room restlessly.

'We must think, boys,' Bates said. 'Maybe the Mapoches——'

'They're prisoners here, just as I am,' Hackett told them. 'Nothing you could offer is any use to them. An'—he leaned forward again, speaking with an angry note in his voice—'they're guardians of the treasure, planted here by the people who planted the shrub, to breed an' last an' go on guarding, but never to leave the valley. There was more wisdom in the old Incas than the conquistadores knew, an' they built a trap here such as has never been built in the world before. An' I believe, some way, there's more in it than the shrub—there's the influence of the old rulers in the valley, an' none of the treasure will ever go out till its real owners come to fetch it, as the legend tells.'

'A child's tale,' Bates said. 'I'm not superstitious, anyhow.'

Suddenly he gripped at the table, and Hackett stood up. There was a creaking noise in the walls of the room, and the floor trembled.

'Make for the open!' Hackett commanded. 'It's earthquake.'

He led the way out, and the three followed—as they went a violent shock flung them momentarily against the swaying wall, but they gained the open to see, far south-westward, a torrent of smoke pouring skyward, high above restless Sangai. The troubled earth shook them and sickened them, and Bates lay down on the ground, his face chalk-white.

'Joan!' Hackett shouted. 'Joan!'

Shaw clutched his arm. 'Where is she?' he asked.

Hackett pointed at the doorway of the house, and Shaw broke forward instantly in search of her. The three whom he left saw him enter the building as the earth seemed to heave itself up in waves, with such a noise as shall be on the last day. A portion of the building facing them collapsed before their eyes, and Kennett gripped Hackett's arm to prevent him from following Shaw.

'Two lives are enough,' Kennett said, explaining.

It may have been minutes or hours that they watched and waited, for in the terror of the earthquake time was forgotten. From north of them came a great crash as of the falling of rocks, and in the end the earth stilled, while up toward the smoke-cloud above Sangai shot a vast tongue of flame. To Bates and Kennett, it was as if the earth were dissolving, but Hackett viewed it more normally: Ecuador knows many such days as that one, and if it had not been for Joan he would have taken it calmly enough. Now, all his thought was with her, and there was agony in his twitching face as Kennett gripped his arm and held him back from the swaying, tottering house.

When stillness had come again, the three went forward to search for Joan and Shaw. They found the two of them together, quite dead, clasped in each other's arms. And Joan's eyes were no longer sad, for death had given her what life could never have made perfect.

'There is a solution to every problem,' Bates

said, reverently removing his hat, 'an' she's found hers, I guess.'

VI.

Two days later Kennett and Bates adjusted the burdens on their mules, and Hackett stood by.

'You two,' said Hackett, 'have been nearest to Atahualpa's treasure—nearest of any that's got away, that is. An' if ever you hear other yarns, tell this one—tell how there's millions of tons of rock fallen over the entrance to the cave, an' half the fields of sleep are under water from the damming of the river. Tell it so that nobody else may ever come near the cursed fields, an'—you've got the emeralds.'

They went back the way they had come, for the way out to the north was blocked by another fall of rock from the shaken hills. At the entrance to the defile that would take them out from the valley they paused to look back, and from the half-ruined house down in the plain a tiny figure waved to them.

'Was there such a treasure?' Kennett asked, 'and are the fields of sleep real? We've never seen.'

'I've seen enough, an' we've got the emeralds to share between us,' Bates answered. 'But, on the whole, I think Shaw came off best of the three of us. He'd never have left her again, an' she—'

He waved back at the figure down on the plain, and turned to go on. 'Poor little gal!' he said.

GEORGE MEREDITH AND FRANCE.

GEOERGE MEREDITH, like that other great Victorian novelist-poet, Thomas Hardy, made his first public appearance in the pages of *Chambers's Journal*. It was in our issue for 7th July 1849 that his verses 'Chillianwallah' were printed. At the time Meredith was but twenty-one years of age—and the *Journal* was four years younger. A month later Meredith married. His wife, daughter of Thomas Love Peacock the novelist, and widow of a naval lieutenant, was eight years his senior. Having married in haste, Meredith had occasion—if not leisure—to repent, until his wife's death in 1861. Soon (1864) he found a new and more suitable mate in Marie Vulliamy, a young lady of Swiss extraction and French upbringing, who confirmed her husband's lifelong love of France—such a love as was bound, sooner or later, to be reciprocated.

In recent years there have been unmistakable signs of an extending Meredith cult across the Channel, and this is sure to be stimulated by a masterly monograph on Meredith by M. René Galland, Docteur-ès-Lettres. Meredith was a

passionate admirer of the Alps and of Dauphiné, and it is fitting that a professor of Grenoble University should undertake the task of presenting to his fellow-countrymen a full-length portrait of this English writer. It is to be hoped that a translation of this discerning and sympathetic study will soon be available for such as cannot read it in the French edition, so excellently printed by Les Presses Françaises of Paris. In a volume of over 400 pages M. Galland covers only the first fifty years (1828–78) of Meredith's life—his youth, we may say, for Meredith was remarkably slow to age—and every reader of this valuable biographical and critical work will eagerly await a further volume from the same source dealing with the last thirty years of a master, the centenary of whose birth is fast approaching.

M. Galland's study is a notable addition to the ever-growing gallery of English portraits from French pens which we owe to the inspiration and teaching of Professor Émile Legouis and his colleagues at the Sorbonne and the other universities of France.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

SICILY is happy in a name that sounds sweetly, a magic name it seems, for the visions it conjures in the minds of those who by power of circumstance are compelled to drive their existence through the sternest parts of a British winter. To be thinking enviously, perhaps, by the fireside, and imagining to the best of one's discontented fancy the loveliness of Sicily, and just to murmur the very name of her—Sicily! Sicily!—is, perhaps, to reach farthest in fancied transportation of mind and pleasure from dull, cold earth to Elysian delights. Ere I first went to Sicily I tested myself in these affairs, and found that while the thoughts of the French Riviera, for example, were highly pleasant, and such as the south of Spain, Egypt, India, parts of North Africa, and the other places to which fortunate people wander in the winter, exerted a peculiar disturbance of one's tranquillity for a few moments, Sicily had always most effect. Others have the same experience. The fact that Sicily is an island, and not easy to reach, may serve a little in the reckoning, but the pretty name does most, while the classic history of Sicily, coveted and fought for by so many nations of the past, with the gods intervening often, is a point as well. But there it is—Sicily! And she is wonderful, magnificent, and in many ways the most delightful of holiday grounds, because of her variety and the way she coaxes interest and investigation and then delighted absorption into the classic past, and for many other reasons; but yet not one in many of those fireside fancies of a Sicily still unknown is right. All the imaginings are scrapped and a new system of delight set up when the reality is presented. Thus in the depth of winter at home, it is not all sunshine and warmth in Sicily, which, after all, is an island, and much exposed. Until near the end of March I found the winter weather in Sicily most difficult; it was, as I knew from reports, worse than what was served in England; and behold the seekers of sunshine in days of February and March huddling round radiators in hotel apartments—miserable, soulless radiators, and not the big fires of supreme comfort that make it often

cheerful to stay at home in Britain. Storms and sleet, dripping scud flying past the windows, chills down the back and into boots—O Sicily! But that is not her fault; for, like other places at such times, she is miscalculated and misjudged. January and February, also March, are the months when most travellers pass through Sicily, and after March the so-called season droops; but it is then that Sicily begins to be herself. If there is a country that is above all else a lover of the spring it is Sicily, and that is a valuable point for remembrance. Linger on the south coast of this island when April starts, and there need be no sighs for England. In this we discover one common misapprehension about Sicily. There are some others. We who have explored the island agree that its most fascinating parts are not those most frequented. So the firesider imagines Palermo, the capital, and itself possessing a beautiful name, as being a city of colouring and other delights, while Girgente (with two soft *g*'s) somehow suggests giants, monsters, and an unpleasant roughness, yet Girgente is queen of Sicily, and save for friends to be seen again, I should not grieve were I not to see Palermo more. But it has fine interests. Here, at their best, are the quaintly decorated Sicilian carts, with scenes of history painted on the panels of all of them, stirring curiosity and then admiration upon the rare exploits of Roger, the northern raider. There are two glorious Byzantine interiors, and decayed palaces of princes in the slums awake us to a sense of the past pomp and dignity of this island, which was a kingdom of great account and a jewel of the Mediterranean for which the conquering races vied. One could look and think for long, and be the better for it, in Palermo, but yet in general aspect and in the emotions it imparts it is often a disappointment. There has been what we may call a Palermo vogue in the past; it has enjoyed the prestige of being a capital. The approach to it by sea from Naples has been a theme for ecstasies by poets, but I know of finer. Nearly a century and a half ago Goethe went to Sicily, and I have examined his statements of impressions. He was four days and three hours on the voyage from Naples to Palermo, and I know at least one

reason why the appearance of the harbour as he reached it delighted him. For me, I went aboard at Naples in time for dinner, slept well, and landed for breakfast in the morning, not believing that this was a grander approach than that to Gibraltar, with the Pillars of Hercules, from the western side at sunrise, or more than one harbour on the North African coast. Goethe, no great traveller, and easily given to enthusiasms, declared that Monte Pellegrino, overlooking Palermo, is the most beautiful headland in the world, and many others have said the same since then, but strangers of to-day have scarce an eye for it. However, Palermo is a sizeable city, has something faintly of the atmosphere of a capital, and it is nobody's business to speak ill of it, but, as is customary, to pass on at good opportunity. There are Taormina and Syracuse, and then Girgente, and other places for deep enjoyment, and then Palermo, after them, has better attractions than before. I feel that Palermo should be taken last in a Sicilian journey, instead of (as commonly) first.

* * *

Taormina is an enticing name, and it has been justified by the place. Long ago, before Taormina was half-spoiled, it must have been a pleasant thing to stay from the beginning to the end of spring at this curious little town, or big village—perched six hundred feet up on the ledge of a mountain rising with a fair steepness from the sea. If you arrive at Giardini, the station down below on sea-level, after dark, you see the lights of Taormina shining high aloft like a new constellation in the sky of night. Its name and beauty have led to that half-spoiling, for in recent years it has been so intensely exploited by tourists of all classes, and especially and disastrously by the Americans, that it has lost its pristine freshness and naturalness. The one long, winding little street, the Corso Umberto, must have been delightful to the stranger when it was, so to say, real and true, for there is still some evidence of its olden charms. But now this street, still picturesque and interesting, contains almost entirely shops that serve the tourists only, with an undue proportion where 'antiques'—when they are 'antiques'—are sold. Also a remarkable number of little cobblers' shops, where, some time ago, the natives invented an industry for themselves—the manufacture of hand-made shoes to the order of the visitors, the colonists, and others. They made them in full view in the shops of this curious street. It is regarded as a good and proper thing to buy a pair of shoes in Taormina; they are neatly, nicely, and even fashionably made of good materials, they fit well, and are cheap. It is the surest way of obtaining value for money in material things—as apart from spiritual exaltation and general interest to the mind, for which the money for

travelling is mainly spent—in the whole of Sicily or Italy. The main street has been transformed through renovation. The purlieus, the narrow byways gained by steep stone stairs, were highly picturesque in other times, and even now, like other parts of Taormina, they hold the artists, but in places below the Corso one comes upon dull houses that were better placed in the suburbs of a manufacturing town. Yet these things must be. I have seen no place in Europe where the American travelling element is so dominant and controlling. One comes by a fancy that these busy, intelligent, and most intensive travellers could, as a party, really win an election at Taormina, but qualification would need to be short and voting quick, for the disposition towards rapid movement is strongly indicated by those who flash through here, and the entire American population changes every few days. When I was there a large Atlantic-liner load of Americans from New York was landed at Syracuse, some way south of Taormina, and along they came, five or six hundred of them all at once. It is at such times and by such sights as these that one is led again to reflect upon the American miracle and the certain future of the world. These people make one think of delicious Taormina as a kind of pump. Nothing is farther from the spirit of this place than machinery of any kind, and a few motor-cars, by which it is almost solely represented, sometimes jar upon the nerves of tranquil British visitors disposed to linger on for a little while; but yet one feels that the circumstances of Taormina for three or four months do palpably suggest the action of some supermundane Anglo-American pump. For these months, the term of which, fortunately, seems to end as the spring comes on and Sicily ascends to her loveliest and best, a big, swollen stream of travellers is pumped north through Taormina, having mostly come from Palermo, at the other end of the island, one day's journey distant, and moving on to Naples and the north of Italy; while at the same time, like the return action of the piston, another stream is pumped south from Naples, not usually to Palermo direct, but rather round the island by Syracuse and Girgente. Two days—perhaps three, or even four—is the time the Americans usually stay at Taormina; British travellers a little longer, since to them Sicily is not merely an incident in a European rush, but still seldom long. Yet it would be a pleasant place in which to linger, were it not for the conscious pressure of this pump upon one's personal disposition.

* * *

Some twenty years ago an American artist came to Taormina, thinking to bide there about three days, but he is still there, and having a home and being well settled, he knows the way to contentment and happiness. For Taormina is unlike other places that travellers know, even places of

the kind through which tourists are pumped ; it has special points of its very own. The mentioned railway-station is almost hidden away far below at the bottom of a precipice. From the top of the height where is Taormina, one looks down, not upon the railway-station, but upon a sea mainly coloured in brilliant purple, for which some Sicilian seas are famous, with a sparkling turquoise border. Though real, it somehow looks unreal, which might be thought a fault in such a sea. For a mark there is a point on the shore where the Greeks first landed and made a city—Nascos—of which no trace remains, and up in the town for its chief historic and scenic attraction there are the splendid ruins of one of the finest ancient theatres, first Greek and then Roman. As you rest on the grass of the amphitheatre, looking towards the stage of old, the view passes through marble columns and broken walls to one of the loveliest scenes of Sicily distantly beyond, the white and vapour-tufted peak of Etna high in the blue, the purple and turquoise sea edging up to Giardini, these framed by one of the ruined windows of the theatre, and the coast-line, leading onto Catania and then to Syracuse, deep below. They say this is the most beautiful view in all Sicily or Italy, where there are so many that entrance us ; and though standards and comparisons are æsthetically impossible, one does not doubt that this would be chosen on a popular vote, for its fame would assist it much. Goethe came wandering through Sicily in 1787, and declared himself thankful it had already been described, since, therefore, he need not attempt the task. The red-gold tints of the old ancient stones of the theatre glow warmly in the sunlight, and the pearly shades of Etna, ranging from gentlest madders by the snow to thin indigo below, assist in marvellous effects of colour. Such as stay in Taormina for more than two or three days fall into a pleasant way of spending mornings in reading or sketching on the grassy banks of the sloping auditorium. It would be difficult to prepare a finer tranquillity. Breathing beauty of the world, one falls to a pleasant pensiveness, while such as like to be concerned with the business of others whom they know not may be continually and most seriously interested, for the acoustic properties of this theatre which the Greeks prepared are still most marvellous. Almost the lowest tones murmured down below by passers-through can be heard high above and long away by others walking round the gallery or sitting on the grass. It is in this way that many of the different States of America become acquainted with each other's business, most intimate gossip, and political prognostications. And it was thus that I came to understand better than before the middle-west attitude in regard to certain great railway problems, as it was lucidly expounded at the far end of the theatre in an undertone to two companions by a gentleman who, I gathered, came from some-

where in Ohio, and the knowledge was improved and made the more valuable for the comments and criticisms of a keen business man from New York, who was sitting some yards away and chattering to his wife. In the time of its glory this wonderful theatre would contain seven thousand people. The Romans changed it much when they came this way, and it changed again as the Romans held it. An eminent English architect, enjoying an effort in reconstruction plans, took me along with him and explained many things. 'It seems clear to me,' he said, 'that, tiring of stage-plays, the Romans had their gladiators here, and that they fought in the arena with wild beasts. See, here are the passages by which they came and went ;' and he explained. 'Yes, evidently they tired of stage-plays,' he murmured, 'just as at home in England they seem to tire of stage-plays now, and need other and cruder things.' This was another of the disagreeable jolts that matters of antiquity make upon the conscience. The analogy was uncomfortable ; the good stage-plays in London as I had left it were so very few ; the people, and those who ministered to their desires, were more interested in prize-fights. This is a place of tranquillity. Time in general is a thing of less than usual account to those who bide a month at Taormina ; it may even be a nuisance. Clocks and watches have their separate tales to tell. The Post Office clock is known to be perpetually wrong, but this is no ordinary Post Office, for it happens at times that it has no stamps to sell, the last supply having been acquired by people for money purposes, or the national distributors may have forgotten Taormina. Letters then may have to be posted stampless. There is a Teatro Margherita in a rare old square in Taormina, but seldom is there any kind of a performance there. Rather does this establishment fall weakly to modernity, for it advertises on the walls in the English language with Sicilian modifications, 'The only place in which is allowed to dance all night.' But better than to witness the fox-trotting, you may see the tarantella danced by agile Sicilian boys, making all manner of fast movements and spinning round like tops ; you may hear the 'Pastorale' played on wooden flutes, short and thick—strange, haunting music in which some say all the spirit of Sicily is held. For this, as we know, is after all the 'Marechiaro' of which Robert Hichens wrote in his famous novel of Sicily ; and on mornings I have walked high up into the hills behind to the Casa del Prete, which was the middle of the scene of the romance. It is in ruins now, but there it is, exactly according to description, with old Norman arch and everything, the broken columns before the door—where the blood calls no more.

* * *

Storms of winter having swept away, the scents of spring lading the Sicilian air came on.

The flowers were wonderful in colour and variety, and the greens more softly, luxuriously brilliant than I have known them anywhere save in our own islands. Evidently, and for a simple reason, greens are for islands. I was sleeping in the small, whitewashed cell of what had been an old Dominican monastery; next door to me was the chapel thereof. So on these spring mornings, uplifting as morns of spring at home, I threw open the little window opposite the foot of the bed, returning to sheets with good excuse for contemplation of a marvellous scene, for just outside the window, almost brushing it, were bushes laden with golden balls of mandarins; beyond were cliffs and banks of green, and, if I held to the dreamy contemplation long enough, an old fellow at a corner up there used constantly to start a matutinal playing of the 'Pastorale.' But the soul of this scene was infinitely the majestic background, which was Etna herself at her proudest and her best. Head on pillow, just where head of holy friar rested in other times, I could see this terrible mountain from a little beyond its base sloping evenly, graciously, grandly on each side to its sharp summit, from which a tuft of vapour commonly exuded. In the morning light the tints on the slope, half snow-covered, are beautiful in their delicate richnesses, rose and violet seeming often to predominate. There are two best views of Etna: this one from my room in the old monastery, and the other from the country on the far side beyond Catania, when travelling thence by railway in the westerly direction towards Girgente, this showing the mountain in another shape, and with a flood of whiter light upon it most times. Yet there is another vision of Etna, who has been adding more chapters lately to her terrible history of flame and destruction, that, to be lightly paradoxical, is presented in the night and is not seen. The stranger's first introduction to this lady of terrors (by one of those curious inversions of feeling, as of the dog that licks the hand that has beaten it, is venerated by the natives round about, and often called in affection 'Mother Etna') is commonly made at night, for darkness has fallen ere the one and only train has brought him in from Palermo when the days are short. Having settled and fed, he may meander into the little street, or a garden if the night is fine, and then, if the air is clear, at intervals of five or ten minutes, out there in the distance and sky-high in the blackness, he will probably see two or three big awful bursts of the most lurid flame, a small extension of it to the right, and then, after a few seconds, a lapse to the deep dark again. There is no sound, as there is at Vesuvius for those who stand on the crater's edge and listen to that weird thunderous roar, which so attracted an American lady who stood beside me listening that she said she had stayed in Naples three weeks longer than intended, in

order to come up the mountain two or three days in each week to listen to it and see it in all its horrors, so fearfully like our ideas of Dante's Inferno. In the daytime these fire-scenes on Etna are not visible, but occasionally a faint murmur of distant sound is heard.

* * *

The psychology of the people who live on the slopes of Etna, and at the foot of it, and within range of its outbursts, is curious and quite unreasonable. Fatality is mixed up with it. History, circumstance, and prudence may tell them of the overwhelming folly of making their homes and depending for their livelihood on the soil of these parts, but none other attracts them, and though hot destructive lava may drive them away to-day, they will seek to return to-morrow, and will be admiring, praising, and even loving Etna on the return. When in these parts I was continually told in a casual way by natives, men and women, that they somehow felt that Etna's time was due, and that she would be in great eruption very soon. They had no reason for thinking it, but felt it. It was only about four months later that the great eruption occurred. Here one might mention, as by special information of an official kind, that, as is the way with all great disasters, the damage of eruptions of Etna is greatly exaggerated at the time, and the last one was a strong example of this tendency to make things seem worse than they really are. Stories were sent to me of cinders falling on the roof of the old monastery where I slept, which was many miles away, and I imagined a scene of widest desolation; but now I am told on the highest authority that not a single person was killed by the eruption, and that only four hundred were rendered homeless, the total damage at most amounting to some seventy million lire, which is less than one million pounds. No other than Mussolini enormously reduces even these figures, saying that only a hundred and fifty people became refugees, and that the damage was not more than two million lire. Seen every day, Etna seems to become part of our existence when at this end of Sicily, and one begins even faintly to appreciate something of the native feeling, fortified as it is by their religious associations, their faith in the preventive effects of staying the advancing lava by certain observances, while the apparent obedience of the 'Mother Etna' to these heavenly demands is laid well to her credit. A geographer of long ago, after seeing the mountain for the first time, wrote: 'It is impossible to contemplate the volcano without regarding it as a being gifted with an individual life, enjoying the consciousness of its strength; the lines of Etna, so regular and noble in their repose, exhibit something of the figure of a sleeping god. It is not, as the ancient legend had it, the mountain that weighs

on the body of Enceladus; it is Titan himself, the ancient protecting divinity of the Siculos. Enceladus was the son of Tartarus and Ge (Earth) and one of the giants of the hundred arms who warred against the gods. He was, by the story, struck by lightning when making flight through Sicily, and Jupiter buried him underneath Etna. They who know much say it is the fiery breath of this Enceladus that Etna gives forth as smoke from the top, and that when the mountain, shaking, is convulsed by eruption, it is a sign that poor Enceladus is once more turning round uneasily below. Pindar and Virgil, and some others who had seen and contemplated, wrote in fine phrases upon various fancies. Virgil suggested that on the flanks of Etna were the forges in which Cyclops and Vulcan

concocted Jupiter's lightning. There is respect and veneration everywhere, and affection, as it seems, from those from whom it might least be expected. I recall the stupid feeling of sentimentalism that possessed myself and two others as, when making journey from east to west of Sicily, through the middle of it, the time came when, by distance and geographical intervention, Etna—unless we returned to her—was about to be shut out for ever from our view. She had dominated us, our views and many thoughts, for several weeks, and now for farewell she presented herself on a clear morning at her loveliest, shining white and gold with delicate inflections of rosy pink. A longing look, and she was gone, and for a while was our Sicily much the emptier for her going.

A GIPSY OF THE NORTH.

CHAPTER X.—IN PERIL BY WATER.

OUT of his profound slumber Roy Carwyke awoke with the sound of a rifle-shot in his ears. Starting up, he looked round with a thought that he must have been dreaming, but even whilst the thought was in his mind it was dispelled by another crashing shot awakening the echoes. The sound came from the river, and, rising to his feet, he moved stiffly to the edge of the bank, where he would have an uninterrupted view. As he did so a chorus of laughter greeted him, and, looking down, he saw a couple of canoes being held against the current. In each canoe there were two men, and in the one nearest to him, sitting in a huddled position with the sun shining on her golden head, was Norma Mannering. A hoarse cry broke from him as he recognised her, and then Standifer's mocking voice sounded across the water.

'You're some sleeper, Carwyke, and it's a pity to have wakened you. But I did not want to seem ungrateful; I owe you many thanks. You pulled the nuts out of the fire for me very neatly. I am infinitely obliged to you. Au revoir!'

Standifer spoke a sharp word. The paddles ceased to break water, and the canoes began to shoot forward. A spasm of despairing wrath shook the watching man. His stiffness forgotten, he ran back to his sleeping-place to secure his rifle. A single glance told him that the canoe had been rendered useless, great holes having been cut in the bottom with a sharp knife. The only weapons that remained to him were an axe, a knife, and his revolver, which, still attached to the broken belt, had been lying among the stones. Seizing it, he ran hurriedly back to the bank.

The canoes were now too far away for the weapon to be of any use, and as he stood there watching the recession of his enemies and of the

girl he loved, his lean face was a picture of utter despair. A burst of mocking laughter sounded across the water; then a rifle cracked, and a bullet whizzed over his head. He did not even move. He was indifferent to anything that Standifer and his crew might do to him, and in the bitterness of the moment death would have been a welcome relief. The shot, however, was not repeated, and with despair in his eyes he watched the canoes moving towards a bend of the river. Till they disappeared he remained an immobile figure; but as they swept out of sight his immobility fell from him like a garment, and as his arm half-lifted hoarse words broke from him.

'If Standifer hurts a hair of her head I will kill him like a dog.'

There was in the words nothing of the despairing wrath which had sent him hurrying from the bank for his rifle. They were the utterance of a resolve which had suddenly crystallised in his heart, and from which nothing would move him. Having spoken his vow, he wasted no more time staring at the empty reaches of the river. Going back to the canoe, he submitted it to a thorough inspection. The framework was intact, but the bark covering was practically destroyed, for, besides the holes in the bottom, the sides had been woefully slashed. It would take two or three days to repair it, and there was not so much time to spare. In the intricate waterways of the north it would be easy to lose track of the canoes altogether, and in that case Norma might pass beyond his aid for ever. That thought shook him with fear and quickened his decision. He would not wait for Billy. He would make a raft and follow in the wake of the canoes, leaving a note for his companion, informing him what had happened and telling him what he proposed to do. That way he

might keep in touch with the Standifer crew until the ex-whaler could come to his assistance; for now they believed themselves beyond pursuit, Norma's captors would probably not hurry over-much.

The sound sleep he had enjoyed had refreshed him considerably. He was stiff after his heavy toil at the tow-line, and his throat was still very painful; but his head was clear, and his legs no longer shook as he walked, and he was conscious of hunger.

After thinking out his plans he built a fire, set a pan of beans to cook, and then, taking the axe, moved up-river until he found what he wanted—a couple of wind-felled trees, which with their sap dried out of them were still sound. Cutting four equal lengths, he levered them to a little sand-bar, lashed them together with the tracking-line which he had used on his journey from the rapids, and fastened across them smaller pieces of timber, split roughly with the axe, to form a platform.

He worked rapidly, and in a remarkably short space of time he had constructed an efficient little raft which, whilst its speed would not be very much above the drift of the current, would bear him safely down the river. After fashioning a rough sweep he returned to the fire, made a selection of stores, ate the meal which he had prepared, scrawled the note for Billy, and, fastening it in the wrecked canoe, lifted the craft to a spot where the ex-whaler was bound to see it if he came down the bank. Then he heaped green wood and leaves upon the fire to cause a smoke and so attract the other's attention; and that done, carried his stores to the raft and set himself adrift in the current.

At first the raft drifted slowly round in the current; but when he got the sweep to work he found that he could keep it head on, and that using the sweep screw wise, he could move a little faster than the water. Then he settled himself to long and steady endeavour.

As he worked the sweep he wondered how Norma had fallen into Standifer's clutches. That the scoundrel had somehow reached Little Novgorod and there obtained the canoes which he now possessed was not difficult to guess. And Norma's presence in the canoe with Standifer was scarcely more difficult of explanation. Probably she had made her way through the woods to the river-bank much farther up, and, utterly worn out, had been observed by Standifer, and had fallen an easy prey. That seemed the likely sequence of events, and that Norma was a prisoner and not a willing passenger in the canoe he was assured; for her detestation of Standifer was so pronounced that she would scarcely have accompanied him voluntarily even to save her life.

Then the problem before him began to exercise his mind. On the slow-moving raft he

could scarcely hope to overtake the canoes ahead—but for one thing. Standifer and his crew would feel that the game was in their hands, and probably would not press the journey over-much. They would make camp somewhere and sleep, and in those hours he would gain on them; and if the river should prove to be free from rapids, in a little time he might even overtake them. He prayed fervently that he might. If he did not, there was no hope for Norma, for somehow the scoundrel would compel her to fall in with his designs.

Again he found himself wondering about the nature of those designs. That Standifer proposed to marry the girl, he knew; but, like Billy, he was convinced that it was not under the compulsion of the ordinary human motive that the scoundrel sought the union with an unwilling maid. There was something else behind. What was it?

He reviewed the circumstances of the girl's life without finding the clue he sought. There was so little there that afforded room for speculation, unless Billy's conviction that some treacherous action on the part of Standifer was the cause of her father's disappearance from the scene of his labours was justified. He himself shared that conviction, and realised that, if it were correct, it pointed to a motive for Standifer's actions that lay beyond the girl herself, that had to do in some way with the lost missionary. What could it be?

Quite suddenly he recalled the big Russian's evident familiarity with Mr Mannering's name, and his excitement on learning that Norma was the missionary's daughter; and in the same moment he visioned the giant laying his filthy hand on Norma's shoulder, and heard again his bellowing laughter as, answering Billy's question about the gold, he had cried, 'No! It is yet far away, but it is under my hand—so!'

Again the suspicion occurred to him that the Russian and Standifer held knowledge of Norma that was denied to Billy and himself, and this time it stayed; and the more he considered it, the more did it deepen towards conviction. The Russian had spoken of himself as a potential millionaire, and had looked at Norma as he had uttered his conviction; and a little time after had made his mad attack on Billy and himself, with the evident intention of securing possession of the girl. Gold! Was that the explanation? Was the late Mr Mannering a richer man than ever he had seemed to be whilst he laboured among the Eskimos? Did Standifer know that, and was the fact that Norma was her father's heiress the explanation of his actions in regard to the girl?

It seemed likely. Men would do anything for gold—some men, at any rate, and Standifer was plainly of the predatory breed. But how had the Russian come to know the fact, assum-

ing it was such? Little Novgorod was too far from Unapik for the natives ever to trade there; and it lay on the wrong side of the Height of Land. The Eskimos would go to the coast stations to do their bartering, and would not make the far more arduous journey across the Height. Yet the Russian had known. There was no doubt of that at all. His half-cryptic words in the light of this thought were a very revelation. But how had he come to know a thing of which even Billy, who had lived in close association with Mr Manning for some years, had remained ignorant?

He found no answer to that question, no certain solution to the other problems that centred around Norma; and, wearied by the reiteration of them, he strove to put them aside, and to consider what lay ahead. His own task was simple somehow, and at no matter what risk to himself, he must get Norma out of Standifer's hands.

That the undertaking was a difficult one he could not disguise from himself; that it could be accomplished without grave risks he did not believe. Standifer now imagined the game was in his hands, and that he was safe from all pursuit; but if he discovered that he was being followed he would be ruthless, and next time he or one of his ruffians would shoot to kill.

Roy Carwyke had no doubt of that. The man was utterly unscrupulous, and would not hesitate to rid himself of one who threatened to become an embarrassment to him. He recognised that when the moment for action came he would have to exercise cunning rather than courage, since apart from the disparity of numbers, armed as he was only with a pistol and an axe, it would be impossible for him to venture upon an open attack. And assuming that his slow pursuit was successful, and that he came within measurable distance of the canoe ahead, the endless summer daylight would make a nearer approach difficult. He would have to wait until the others were in camp, and then try to approach by land. Assured as they would be of their safety from pursuit, the abductors would be careless, and it might prove to be possible to get into touch with Norma, and escape with her into the great woods. Such a course would itself mean a plunge into new dangers, but they were preferable to the fate that awaited the girl if she remained in Standifer's hands.

The raft gave a heavy swerve that brought him from his reflections to the realities of the moment. The pace of the current, as he saw, was quickening, and the low swampy valley was narrowing between the hills, which ahead, instead of being clothed in green pine, lifted gaunt and blackened trunks, showing that some great fire had swept the narrowing valley. An anxious look came in his eyes. If there were rapids ahead, as was likely, the raft was no

craft on which to venture them. In rough water or among the rocks it must inevitably go to pieces and leave him at the mercy of the waters.

Yet he kept on. To land and reconnoitre would be a waste of precious time. His sole chance of overtaking Standifer lay in steady unhalting progress, and whatever risks the narrowing valley held must be faced and taken as they came. The mountains on his left hand were growing higher. On one, which lifted a strange pinnacled top to the skies, he caught the gleam of snow, and the bank on that side was now barren rock, worn smooth by the rush of water or the friction of ice.

Still the valley closed, and soon he was flanked by hills on either hand, hills which marched so close together that they shut out the sun; and as it surged down the gorge the water had a dark, glassy look. He considered it carefully. The glassy quality of it troubled him. With scarce a break in its smooth surface it raced forward. The only sounds in the gorge were made by the screaming of a pair of eagles high among the crags, and the ripple of the river against the rocky sides. He lifted his eyes from the water to the ramparts which hemmed it, and made the discovery that the black water was hurling him forward at a quite terrific pace. The dark rocks on either hand were sliding by. At a point ahead he caught sight of a huge rock, which at some time had fallen from the heights above. It was at least four hundred yards away, and with his eyes upon it he began to count aloud slowly, 'One, two . . .'

At fourteen he was whirled by it like a feather in a great wind; and a second later, as the gorge turned a little, under its tan his face went suddenly gray, and his heart almost stopped beating. Up the gorge came a booming sound, the sound of falling water. He stared about him desperately. Those smooth rocky sides offered no escape. They hemmed him in precipitously, and the water hurled him forward to destruction.

Ahead he caught a gleam of sunlight playing on a cloud of spray and flashing into rainbows, whilst the roar of crashing waters filled the narrow place. He released his hold on the sweep. It was now no further use. Destruction lay before him, and in a minute he would take the plunge that would be the end. In that short space he found time to wonder if Standifer's canoes had also been swept to destruction. It was more than possible, for, like so many rivers of the Alaskan wilderness, this river was uncharted. Standifer might, however, have landed farther up, and portaged over the hills, in which case he would have been saved from—

A wind up the gorge brought a cold mist of spray against his face. The shaft of sunlight grew suddenly more bright, and as the raft hung for a moment on the very edge of the fall,

as if hesitating to take the leap, he visioned the greenness of a sunlit valley, and the next moment shot into space and plunged through the cascade to the depth below.

Hope, fear, all emotions and all feeling were lost in the single, supreme, sickening sensation of falling. He felt himself plunged deep into water, where darkness that he conceived to be the preliminary of death overtook him; then he was shot upward to the light of day, bruised and gasping, but alive. A second later he was caught in a whirlpool, carried round once or twice, and finally cast out on the outer edge, and whirled forward anew.

Finding himself alive, he deliberately surrendered himself to the current, striking out with it, and trying to recover his breath. More than once, however, he was in danger of drowning. The river was full of eddies and whirlpools. Once he was sucked down and came up breathless, almost black in the face and helpless, then again he was hurtled forward. But soon the current began to slacken, and as his mind recovered from the shock of the fall, his will began to assert itself and to search for deliverance.

Ten minutes later this offered itself. Below him a 'sweeper,' a great pine which had fallen in the river, but was still anchored to the crumbling bank by its roots, offered itself. It stretched a third of the way across the swirling water, bobbing up and down in the stream, and if he could reach it, salvation was assured.

Summoning his waning strength, he tried to strike athwart the current. It was but a little deflection of his course that he was able to make, but it was sufficient. A minute later he was swept among the feathery boughs, and clutched them desperately.

The hurrying water pulled at him as if to break his hold; but he clung on, and when his breath came back he began to drag himself inshore, shifting his hold from branch to branch until, dropping his feet, he found himself able to wade. Dripping wet, utterly weary, chilled to the bone and shaking like an aspen, he climbed to the bank, and then collapsed upon the dry pine-needles that were strewn everywhere.

Motionless he lay there like a dead man, a numbness on his mind that made even thought impossible. He was in the condition of collapse that will sometimes follow great exertion—when nothing matters, and when life itself seems to be on the verge of ebbing. Ten minutes passed, and still he lay on his face among the brown scatterings of the pines; then he gave a sudden start, rolled over, and sat up with an incredulous look upon his face, his eyes staring down the valley, up which the wind was blowing.

His attitude now was one of tense alertness. He looked like a man who was listening for something. A moment later, through the swirl and rush of water, he caught that for which he was listening—a man's voice shouting.

'Is it real?' he muttered, as he staggered to his feet and turned his face down-stream.

As he did so, the odour of burning pine was borne to him on the breeze; and, exhausted though he was, he began to stumble through the trees, working his way down the valley. The nature of the land caused him to make a diversion. He stumbled into muskeg, but forced his way across to firmer land, a bemuddled, dragged figure. Thickets of willow hid from him what lay ahead, but he stumbled through them, waded a small stream to the bushes on the farther side, heard a man laugh, caught anew the pungent odour of resinous wood burning; and then broke from the willows almost on the encampment he was seeking.

Two men were standing by the fire, their backs towards him, staring away from the river up a valley which ran almost at right angles from that which the river followed. On the rough grass lay a canoe, beside which stood Norma, a pensive look on her beautiful face. As her eyes fell on his dragged figure she cried out in surprise, and as she did so one of the men turned sharply on his heel. It was Standifer. For a moment he stared incredulously at the other as if he had been some ghostly apparition; then he cried out sharply, 'Carwyke, by Jove!'

(Continued on page 221.)

THE MASSACRE OF MONZIEVAIRD.

By HENRY HILTON BROWN.

I.

THE old kirkyard of Monzievaired lies close to the avenue of Ochertyre, about two miles from Crieff. The country here swells into hills, which are at first grass-grown, varied by patches of wood and lines of trees; then heather hills succeed grass hills, rising bare and rugged, until they culminate in the 3000-foot peak of Ben-y-Hone, where snow lingers till

midsummer, and the peregrine falcon builds its nest.

We see to-day a perfectly peaceful scene. We might fancy that bloodshed and strife had never invaded this happy glen, until we remember that the kirkyard of Monzievaired witnessed the most horrible atrocity recorded in the grim annals of mediæval Scotland. It was a tragedy which roused much anger at the time, and which brought consequences that fulfilled

the saying: 'There is no great evil but brings other evils in its train.'

George Murray, Abbot of Inchaffray, in the beginning of 1490, resolved to assess the teind payable for lands in the parish of Monzievaired possessed by the Clan Drummond. It were vain to ask whether this was a deliberately provocative measure; it was assuredly a most unwise one. There had been feud between Murrays and Drummonds for many years, and fresh fuel ought not to have been cast upon the fire, especially by a churchman. The Abbot granted warrant to the Murrays of Ochtertyre to collect the assessment, and the Murrays collected it no doubt for their own satisfaction, but also as a duty which they owed to the Church, and which they dared not decline.

The aggression roused bitter indignation among the Drummonds. A number of clansmen, assisted by M'Robbies, assembled under the leadership of David Drummond, second surviving son of Lord Drummond. They met the Murrays on Knockmary, a small hill across the Earn opposite Ochtertyre. Both sides fought well, but the Murrays were worsted, and fell back across the river. The Drummonds had suffered severely, and also withdrew. Unfortunately they encountered a party of Campbells, who were at feud with the Murrays. The Campbell leader upbraided David Drummond with leaving half-done work, and urged him to join forces, return, and make an end of his foes. David's clan ferocity flashed up at the proposal. The battle had been inconclusive; he would now fight to a finish. Drummonds and Campbells crossed the Earn, probably by the old bridge of Strowan, and advanced upon Ochtertyre.

The Murrays, seeing the enemy strongly reinforced, prudently declined a combat. According to recognised right, they took sanctuary in the church of Monzievaired. Six score—some say eight score—men, women, and children shut themselves up in the sacred building. David Drummond must have known the extreme danger of violating sanctuary. He proposed to abandon the attack, but at that moment a Murray foolishly shot an arrow from the church and killed a Drummond. Prudence was now scattered to the winds. The Drummonds gathered furze, brushwood and small trees, and piled the combustibles against the building. They then set fire to the heap and to the heather thatch, and burned alive all the miserable inmates. None escaped except a boy, who was saved by a Drummond of milder mien.

It is curious to note the upshot of this act of mercy. The unfortunate Drummond was so execrated by his clansmen for his weakness in saving the boy, that he fled to Ireland. Finding there that he had exchanged one tribe of savages for another still more savage, he returned to Perthshire, became a vassal of the Murrays, and was given a grant of lands. To this day

these lands bear his name, Drummondernoch, Irish Drummond.

II.

If the Massacre of Monzievaired had occurred in a private house, it is probable that vengeance would have been left to the Murrays. Such horrors were not infrequent in Scottish private wars. But this outrage was sacrilege. The Murrays when attacked had been executing an ecclesiastical warrant, and they were burnt in a consecrated building. The crime was an insult to the Church of Rome, which well knows how to resent such affronts. Pressure was put upon the king, James IV. The pressure must have been irresistibly heavy, because the criminal was a son of Lord Drummond, who was not only Justiciary General and probably the greatest man in Scotland at that date, but was also a dear friend of the king, and one whom he delighted to honour. It was a strong step to behead the son of such a man, but pressure prevailed, and the leader of the Drummonds was executed at Stirling.

There is some uncertainty as to the name of that leader. It has been assumed in this article that David Drummond, second surviving son of the first Lord Drummond, was in command of the Drummonds at Monzievaired, and on the whole this is the more probable theory. Local tradition at all events asserts that he was leader, and that not only was he put to death, but his name was blotted from the list of his father's sons. The reader can verify for himself part of this tradition. If he consults *Burke's Peerage* under the record of the noble family of Perth, he will find it stated that the first Lord Drummond had nine children. Their names were Malcolm (who predeceased his father), William, John, Margaret, Elizabeth, Beatrix, Annabella, Eupheme, and Sibylla. If there had been a David Drummond, his name must have been expunged from the list, as tradition relates. But the family tradition, as given in the *Peerage*, accepts the view that William, Master of Drummond, Lord Drummond's oldest surviving son, paid the penalty of the crime. Against the family view it has to be observed that Lord Drummond himself, in a bond of redress for the outrage, declared that the culprit was his second son. The Master of Drummond was in fact his second son, Malcolm, his first-born having died, but if Lord Drummond had meant his eldest son and heir we should have expected him to use his son's lawful title, Master of Drummond. The old historian Lindsay of Pitcottie, who, though often inaccurate as to dates, is usually trustworthy as to names, is perfectly definite in his statement. He says that Lord Drummond's son David led the Drummonds at the Massacre of Monzievaired. The point is both curious and instructive, but we must not here pursue it farther.

III.

'There is no great evil but brings other evils in its train.' Three brasses in the choir of Dunblane Cathedral bear silent witness to this truth, and to the train of evils which followed the Massacre of Monzievaird.

It might have been thought that after the massacre James would have had enough of the Drummonds. We should have expected that the intimacy between royalty and Lord Drummond would have been checked. It had been better for His Majesty had he kept the old friendship under restraint, but no Stuart brooked interference with his private loves and hates. Partly because the hunting in Glenartney was first-rate, and partly to soften any feeling which his old friend might retain in consequence of his son's execution, the king continued frequently to visit Drummond Castle, and to remain there for considerable periods. There was another attraction.

Margaret, Lord Drummond's eldest daughter, was a beautiful and charming girl. James IV. could not withstand female beauty. Sir Walter Scott, thinking of Lady Heron of Ford and the Battle of Flodden, uses of James grave and serious language :

And thus, for France's Queen, he drest
His manly limbs in mailed vest;
And thus admitted English fair
His inmost counsels still to share;
And thus, for both, he madly planned
The ruin of himself and land!
(*Marmion*, canto v. 10.)

At this earlier date, with equal madness, James was prepared, for the sake of Margaret Drummond, to reject the advice and undo the labours of his wisest counsellors, and to sacrifice the future peace and prosperity of his kingdom. He fell madly in love with her. It is said that he secretly married her, but whether married or unmarried she bore him a daughter in 1497. This fact disposes of the absurd fable that he married her when he was Duke of Rothesay. He ceased to be Duke of Rothesay at his accession to the throne in 1488, and if he had been then the husband of Margaret Drummond, his child must have been born many years after the marriage. The truth probably is that James never married Margaret Drummond, but intended to marry her so soon as he obtained the consent of his nobles and clergy. But it was not to be.

It is necessary to remind the reader that a marriage between the king and Margaret Drummond would have been repugnant to a powerful party in Scotland. Some were mindful of past acts of aggression and violence on the part of the Drummonds, and did not forget that Margaret Drummond was sister of the leader in the Massacre of Monzievaird. Others disliked the family, and would not willingly see

another daughter of the house raised to the throne, as had been done in the case of Anna-bella Drummond, Queen of Robert III. A third and larger party was intriguing to bring about a marriage between James and Margaret Tudor, daughter of Henry VII. of England. An entanglement with Margaret Drummond would have formed a fatal bar to that scheme, and to all the benefits which Scotland was to derive from it.

We can easily imagine the end of those combined influences. In 1501-2, when the poor girl was at breakfast in Drummond Castle with her sisters Eupheme and Sibylla, a miscreant placed poison in their food. The three died. High rank and power must have been behind the murder, otherwise it is inconceivable that the ladies could have been poisoned in their father's house and no one brought to justice. The murderer would have been reached had he been within reach. The Dean of Dunblane, uncle of the ladies, buried them in the choir of Dunblane Cathedral, where the brasses now lie, and the romance of Drummond was ended.

IV.

Margaret Drummond slept with her fathers. Next year (1503) James IV. married Margaret of England, and, as a result, in 1603 his great-grandson James VI. united the crowns of England and Scotland. Yet the passion of James for Margaret Drummond was sincere, and we are not left in doubt that if she had lived there would have been no marriage with Margaret Tudor. In that case there would have been no Union of the Crowns in 1603; no Stuart kings in England; no Oliver Cromwell, Lord Protector; no Civil War or Stuart Wars. British history, as we know it, would not have been, and no man can say what other line it might have taken.

The murder of the Ladies Drummond was a dreadful and cruel crime, but, like all such tragedies, it had some consequences that were not evil. It cleared the way for the marriage with Margaret Tudor, which ultimately brought about the Union of the Crowns. It was an important factor in British history, yet it might not have happened but for the antecedent crime at Monzievaird. The massacre changed the course of events. In the first place, it led to James IV. cultivating the society of Lord Drummond even more assiduously than he had done in the past, and to his being thus brought more frequently into the presence of Margaret Drummond. In the second place, it raised a strong and justifiable opposition to a union between the king and the sister of the leader in the ghastly crime. It contributed its mite towards the attainment of the English marriage and the Union of the Crowns, and in that way promoted the welfare of the two nations.

A TRAVELLING BEACH.

By OSWALD WILDRIDGE, Author of *The Luck Penny*.

I.

BY the experts who revel in the technical terminology of their craft this description of one of the phenomena of the Solway Firth as 'a travelling beach' will probably be regarded as an offence. Rather would they deal with the wonder as a case of 'accretion' on an extreme scale, and cite it as one of Nature's compensatory operations, an endeavour to restore on our western coast the havoc wrought by erosive action on the east. Fortified, however, by memories of that seaside kingdom as it was formed in the adventurous days of boyhood, when all its curves and wrinkles were as familiar as the nooks and crannies of home, I adhere resolutely to the text; this is no ordinary case of accretion, there is no extravagant stretching of words in depicting as 'a travelling beach' that enormous mass, a veritable ocean of stone which has swept with incredible speed along the English shore of the firth and overwhelmed the John Pier at Workington, burying the greater portion of its bulk from sight.

Not that the obliteration of the quaintly-named pier is the only revolutionary deed to be laid to its account. It has entirely changed the contour of a length of our maritime border; at one period it threatened the destruction of an ancient port; it has compelled the building of a giant breakwater at a point where, ten years ago, such an enterprise would have ranked as a colossal folly; it has reshaped the estuary of the Cumberland Derwent, driven the river to seek a new outlet to the sea, altered the location of its bar; and, to crown all, has left to myself the mere memory of a cherished playground. To-day the exile returning to his native haunt finds most of the old things passed away; the land has lifted—to name the number of feet is to risk one's credit for veracity—and but for the background of the Shore Hills and the loftier hills of Galloway across the gulf, he might fancy himself in a strange land.

All this, of course, and that other devastating work yet to be described, offer convincing proof of the Solway's peculiar majesty, that power to which Sir Walter Scott pays eloquent tribute in the pages of *Redgauntlet*, wherein he proclaims that 'he who dreams on the bed of the Solway may wake in the next world,' refers to a blast that brings in the 'waves three feet abreast,' and sets forth that 'the tide advances with such rapidity upon these fatal sands that well-mounted horsemen lay aside hopes of safety if they see the white surge

advancing while they are yet at a distance from the bank.'

To strangers who have never had the good fortune to look upon that water-flood which cuts like a huge spear-head deep into the heart of the land this picture of its power may easily have the ring of exaggeration, but those who dwell by the foot of the Galloway hills or the sea-washed border of the English Lake Country can faithfully bear witness that when he penned it the Laird of Abbotsford was free of all indulgence in literary license. Rather does his three-feet wave belittle the tidal bore. Impelled by a stiff sou'-wester, the sea races into the upper reaches of the firth in fearsome form, and along the shore there are old inhabitants whose tales of traditional storms give a measure of twice three feet to the wave.

But whatever pre-eminence the tidal bore as symbolising the Solway's power may have had in the days of *Redgauntlet*, it no longer holds pride of place. For that we must turn to the strip of progressive beach whose fantastic movement becomes dominant about ten or twelve miles to the north-north-east of St Bees Head, and maintains its influence right up to the mouth of the Derwent, a mile and a half farther on. The movement may indeed be observed in varying degree at other points on the English shore of the firth, but it is here that it ranks as one of the phenomena. Its accentuation at Workington is largely accounted for by the fact that the town in the course of its industrial activities has made a heavy contribution to its own sea-shore material. It has, so to speak, manufactured its own beach.

As its iron and steel trades have developed, so has its output of blast-furnace slag; for this the shore has offered an admirable dumping-ground. Great capes of the refuse have been flung out seaward; from these huge masses have been torn by wind and tide, and ground into sand, shingle and boulders; and from this source the army on the march has been enormously recruited, and employed to terrific purpose. Advancing as the waves of the firth, this torrent of stone has swept athwart the land, and up the land, until now the outer works erected for the protection of craft entering the port have shared the fate of Egypt's treasures, the only difference being that whereas the antiquities of the dead empire are lost in the sands, the modern products are tucked away under a more solid coverlet.

II.

Coming to the coast by that projecting spur where the Derwent, reputed to be the swiftest

of all English rivers, pours the waters of half-a-dozen of the Cumberland lakes into the sea, you will find a short length of stone parapet rising out of the beach—real beach this, not a blend of slag and shingle—and this with a patch of pavement is all now left for the eye to behold of the first breakwater built in the days of the famous Cumberland brigs. The rest is submerged in the rocky flood.

To preserve the port from the disaster which so plainly menaced it a number of stout wooden groynes were laid out along the sea-board, and a lengthy arm was added to the vanishing breakwater, this consisting of a deep concrete base surmounted by a timber deck, and rounded off by a lofty lighthouse tower. Around that tower memory has spun a web of glowing recollections. With the world in tumult, roar of the wind overhead and thunder-crash of the Solway below, I have watched the sea beat against its massive front, sheets of foam and tongues of solid water sweep clean over its pillared lantern; on days of sunshine have played pirates and built castles of sand by its friendly feet. But the bairns of to-day must seek their sands elsewhere, and they who frisk upon the melancholy lantern tower may leap without risk of hurt from its protective wall on to the crown of that wandering beach. As for the groynes, they have been partly swamped and partly battered to pieces.

Once more, then, the engineers were called upon, and John Pier was carried for the third time still farther out towards low-water mark, and again the lighthouse lantern was given a new lodging whence to fling abroad its guiding gleam. But now the Solway was greedily nibbling at those banks of slag, and the travelling beach moved on in greater volume and with accelerated speed. So swift and so mighty, indeed, was the advance that the generation that watched the construction of that last segment of pier has also witnessed its subjugation. For the concrete base, like the one to which it is attached, you search in vain; it is there, but tucked away beneath a massive pall. And when, after long absence, I sought it, the encirclement of the tower was also well advanced.

This phase of the attack was, indeed, positively startling, alike in the rapidity of its development and its product. Every high tide and every storm left a definite mark on the face of the land. That beach became a devouring host, irresistible; overleaping the solid barrier built to break the waves of the sea, it plunged down into the estuary; it turned the waters into dry land; drove the Derwent out of its course; compelled it to bore a new channel through the northern sand-banks; and in all things proved itself the master. As its supreme triumph it created Spion Kop, a mountain in miniature, on its newly-conquered territory beyond the pier,

a lofty eminence of boulders big and little, pebbles, shell, and sand, to which the natives gave the name of the battle-scarred hill on the banks of the Tugela.

In the choice of this title one can detect a suggestion of sinister import. Spion Kop, in so many of its memories, is associated with defeat, and this was the most devastating blow which the malignant operations of natural force had hitherto dealt the ambitions of the port. Its fairway entrance was not only diverted, but it was blocked to all ships of deeper draught than an ordinary schooner. And yet, like so many of the evils, this one proved to be, if not a blessing in disguise, at least one of the calamities accompanied by compensation. By the time that a powerful dredger and the Derwent's tremendous scour had cleared the way, the peculiar compost of Spion Kop was discovered to have a commercial value, and a railway line being laid from the harbour, much of it was shipped away and employed, I believe, in the manufacture of concrete.

Confronted by a foe so powerful and so persistent, the men of this Solway town might have been pardoned had they long ago surrendered, permitted Nature to work her ravishing will, and abandoned their long-cherished dream of establishing a first-class deep-water port in the jaws of the firch. But audacity has ever been their watchword. Not even Spion Kop or the blocking of their fairway was sufficient to crush their purpose. All through the years, so far as the limited amount of money at their command would allow, they have given battle to the advancing monster; again and again they have forced the Derwent into an orderly course, and compelled it to help in sweeping its own channel, so that ships might enter with their Spanish ore for the steelworks, and others depart with steel-rails for transhipment at the bigger ports where the ocean tramps congregate. And now audacity and unflagging perseverance are to meet with their reward.

The port having passed into the possession of the United Steel Company, that great corporation has secured a Government grant of half a million pounds, and is now engaged on the construction of a spacious dock, the completion of which will exalt Workington in 1925 to a place among the great west coast ports. As an essential part of the scheme the company has also undertaken the completion of a giant concrete breakwater—commenced ever so long ago, but suspended because of the war—several hundred yards to the north of the channel down which the Derwent at one time flowed; and now that the slag-banks are being trained parallel to the sea instead of being thrust out towards its depths, the travelling beach has lost its principal feeder and its power to harm. Already, moreover, the breakwater and certain other works have so concentrated the Derwent's mighty scour that

the deep-water channel has been more than restored, and those 12,000-ton cargo-carriers for which accommodation is being prepared are assured of an easy access to their haven.

But it has been touch and go. The top stones of old John Pier stranded in that bouldered waste stand in monumental testimony to the desolating power of that terrible traveller.

THE MONTH: SCIENCE AND ARTS.

A CLEAN, SAFE, AND SILENT LAMP.

EVERY one who uses them will agree that paraffin lamps have their drawbacks. They always smell slightly, and often strongly; while the trimming of them is one of the most unpleasant of domestic duties. Petrol lamps are cleaner, but, being of the pressure type, they make a slight buzzing noise, to which many people object. Both paraffin and petrol lamps occasionally smoke, and with petrol there is always the risk of fire. A new incandescent lamp, which burns methylated spirit, is free from all these drawbacks, but, of course, the light from it costs more than from paraffin or petrol. The burner consists of an outer tube, provided with air-holes, which screws into the container, and carries at its upper end the chimney and the shade. An inner tube is divided horizontally into two parts by a partition across the middle. Into the lower part is pushed a bundle of loose cotton wicks with a perforated brass ferule over their upper ends. The wicks are not in contact with the flame; in fact, they are entirely shut off from the burner. Their function is to raise the spirit into the lower part of the inner tube. Here it is heated by the burner above and gives off vapour, which flows through a tiny pipe to a jet that delivers it into the upper part of the inner tube, this forming the burner. The burner is open at the top, and contains a gauze cylinder, closed at the upper end by a brass disc. The hot gas issues from an angular space between the edge of this disc and the inner tube. A vertical rod with a forked top carries the mantle, of which the skirt hangs over the burner. It is worth noting that air is drawn in at the jet and mixes with the spirit vapour. The efficiency of the burner is therefore higher than that of the ordinary spirit flame. So far it has been assumed that the inner tube is hot enough to vaporise the spirit; but this would not be the case before the lamp was lit. To heat the burner and so start the vaporising process, a few drops of spirit are burned in an annular tray between the inner and the outer tubes. Spirit is pumped into this tray by a tiny plunger pump at the bottom of the container, mounted on an extension of the inner tube. The pump rod, really a piece of wire attached to the plunger, is brought up to the lower part of the burner, where the end is turned over at a right angle and projects through a slot. A spring pushes

the plunger up after it has been depressed. Two or three strokes pump enough spirit through a small pipe into the tray, where it is lit with a match, and heats the burner sufficiently in a few seconds to generate gas. The amount of gas passed to the burner, and, therefore, the light of the lamp, are regulated by a spindle with a knurled head. Attached to this regulator is a device that puts out the lamp instantly if it is knocked over or even canted to an angle of 45 degrees. These lamps are made in three sizes, entirely of brass and polished; but alternative finishes are oxidised copper or silver, bronze, antique brass, or wood. They are perfectly clean, do not smell, require no attention other than filling, and are safe. The cost for spirit varies from $\frac{1}{4}$ d. to $\frac{3}{4}$ d. an hour, according to the size of the lamp.

UTILISING DUST-BIN REFUSE.

Although it is unlikely that future generations will overhaul our refuse-dumps to extract the valuable materials they contain, recent developments have shown that the contents of dust-bins, as collected in towns and cities, can be completely utilised. It does not follow that the process actually yields profits in relief of the rates, but it certainly reduces the cost of disposing of this undesirable matter. At Sheffield a particularly effective scheme for the disposal of the city's refuse is in operation. Electric dust-carts deliver the contents of the dust-bins at the disposal works, where electric cranes and grabs empty them into rotary screens. In these the refuse is separated into dust, fine cinders, coarse cinders, and tailings. The dust has a considerable fertilising value; the fine cinders can be made into briquettes; the coarse cinders, after being passed through washers to free them from incombustible material, are used for raising steam on the works, and are also supplied as a cheap fuel to other steam users. The tailings pass slowly along on a picking belt, during which process paper, rags, tins, and bones are picked off by hand. Papermakers take the paper and rags; the tins are sent to steel works; and the bones are made into manure. The steam raised from the coarse cinders is used for generating electricity, and so much is available that there is enough to drive all the machinery and to charge the batteries of the electric dust-carts. To some extent, therefore, the scheme is self-supporting.

AN IDEAL SINK.

Of late years great improvements have been made in kitchen equipments for the washing-up of crockery and pots and pans. An important item in this progress is what may be termed a triplex sink. Made of white-enamelled stoneware, with supports of the same material, this device has three compartments. The two outer ones are used for washing and rinsing respectively, while the middle compartment, which is comparatively narrow, serves as a drain to the other two. Between each outer compartment and the middle one is a division which does not come quite to the top; this forms an overflow weir, over which the grease runs away. The water is drained from the outer compartments, when required, by lifting brass flap-valves at the bottom, thus allowing communication with the middle compartment, where the water drains away through a large grating over a bell-mouthed drain-pipe. A teak capping is screwed down all round the top edge of the sink, making a watertight joint, while at the front it forms a splash-rail. Screwed to the capping, and surrounding the back and sides of the sink, is a teak draining-board, which may be supplemented by racks under the sides. Nickel-plated hot and cold water taps, with long swivelling arms, which will deliver into either compartment, are arranged at the back of the sink.

THE EVER-ENCROACHING DESERT.

That certain large sections of Central Asia which once 'blossomed as the rose' are now almost sterile deserts is a fact well known to geographers. This striking change has been brought about by gradual but long-continued drying-up of their waters, an apparently permanent change in climatic conditions being thus produced. Dr Livingstone's prophecy, based on his personal observations, that the country around Lake Ngami, in the northern part of Bechuanaland, would suffer a similar fate appears to be amply borne out by a recent article in the *Geographical Journal*. The author, Captain A. G. Stigand, declares that Ngami has ceased to be a lake in the ordinary acceptation of the word, for it is only occasionally that it contains any water at all, while the area submerged even during a flood is trifling in comparison with the extent of the lake only a few years ago. As Captain Stigand viewed the lake in April 1922, 'So far as one could see with glasses from the eastern end, the whole lake bed had been transformed into a level and smooth golf-course-like flat, covered with short quick-grass.' The desiccation already so apparent in the Lake Ngami district is a danger that threatens a large part of South Africa, and that demands the serious attention of the Africander. That it has not escaped the notice of

scientific men was shown by the publication some years ago of a book entitled *Thirstland Redemption*, in which the author, Professor Schwarz, of the Rhodes University College, suggested that the series of inland lakes, of which Ngami is now the moribund survivor, should once more be called into being by the damming of certain rivers to the north, especially the Chobe or Linyanti River, a tributary of the Zambesi. The creation of a large inland water-surface, he suggested, would so moisten the surrounding atmosphere as to lead to the precipitation as rain of any moisture borne in from the sea, instead of its being, as at present, dissipated by the dry winds. The cost of the scheme would, of course, be very great; but some such plan may have to be adopted if this portion of South Africa is to be saved from the fate of a large part of Central Asia.

A TENNIS-BALL WASHER.

Tennis-balls usually require washing from time to time, and several contrivances have been devised for this purpose. Scrubbing with soap and water is effective, but too slow where large numbers are involved. Among recent machines for washing tennis-balls is one which will treat six at a time. It comprises a circular wood box inside of which is a ball-race of a size to fit the balls, and deep enough to take about one-third of their diameter. The boss in the middle of the race is raised, and carries a steel spindle. A wooden lid to the box contains an inverted ball-race which fits the upper sides of the balls. The lid has a hole in the middle for the spindle, and a handle by which it can be turned. The lid is not so big in diameter as the box, and when in position its lower edge goes down into a groove between the ball-race and the edge of the box, while a thumb-nut on the top of the spindle not only holds the lid down, but imposes a pressure on the balls, so that the covers are squeezed at every turn. The action of turning the lid clockwise screws up the thumb-nut until the correct pressure is reached. In a like manner the reversal of the rotation unscrews the nut and facilitates opening the machine. At each side of the box is a spigot for rubber hose, one side being connected to a water tap, the other to a drain, the entering water issuing through holes round the base of the spindle. A special soap solution is supplied for use with the machine. When a number of tennis-balls require washing the thumbscrew is removed from the spindle, the lid is taken off, and six balls are placed in the ball-race, with a small dab of soap solution on each. The lid having been replaced, it is rotated in one direction, while the water is turned on so as to run slowly. When a good lather appears round the edge of the lid the water is turned on full until it shows clear at the waste-pipe outlet, when the balls are removed, squeezed

in a towel, and left to dry in the open. It is claimed that the rolling and squeezing action of this machine actually improves the covers, whereas devices which scrub tend to wear them out

A NEW INDUSTRY.

The rapid rise in the cost of coal-tar pitch, the binding material used in the manufacture of coal briquettes, has seriously affected that industry, and so created the demand for a substitute, which has fortunately now been discovered. Mr F. C. Thornley, a Briton by birth and parentage, whilst carrying on certain research work on the Pacific Coast of North America, was struck by the enormous gelatinous content of the seaweed there cast up, and foresaw the possibility of its industrial development. Painstaking research, chemical experiment, and practical test have now evolved a binder more effective and less costly than coal-tar pitch. An all-British private company has been formed to finance the project; and a factory has been built at Stromness, Orkney, where both material and labour are available for the new industry. The basis of the binder is seaweed, and the three natural orders, *Chlorospermæ* (green), *Rhodosperræ* (red), and *Melanospermæ* (olive) can be utilised. *Melanospermæ* is, however, richest in the necessary gelatinous product; and of that order the species *Laminaria*, popularly known as oar-weed, curvy-tangle, sea colander, or devil's apron, gives a better return than the *Fucus* or rock weed species. *Laminaria saccharina*, *L. chorda filum* (sea rope), and *L. ataria esculenta* (the badderlocks of Scotland, or murlins of Ireland) are especially rich in gelatine. These seaweeds are cast up on our shores to the amount of some 3½ million tons annually, and, except for small quantities used as manure, winter fodder, and in the manufacture of kelp and iodine, are allowed to go to waste. Special apparatus has been designed for the recovery of these products, and special arrangements made for collection and storage. In manufacturing the binder the fronds of the *Laminaria* are separated from the stems, which are stacked and dried for other purposes. The fronds are then reduced to a pulp, the excess liquid resulting from the process being collected for distillates. The resultant pulp residue, naturally absorbent of water, is then emulsified by treatment with oleaginous waste, so as to render it non-absorbent. The binder is now ready for transport to the coal or lignite briquetting works, where it is mixed with the fines and slacks of coal. The result is a briquette not readily pulverised, clean to handle, economical, and of high calorific value. So satisfactory is the 'Thornley Binder' considered that the demand exceeds the present maximum output of the factory; and that is by no means small.

AN EFFICIENT SUBSTITUTE FOR DOOR BOLTS.

Whenever doors first came into use there is little doubt that bolts for fastening them were invented soon after, and, except that they are now made in metal, the bolts may be said to have retained their original form to the present day. A different type of door fastener, which combines great strength with simplicity and a neat appearance, has lately made its advent. The fixed part of this device consists of a triangular piece of brass, three-sixteenths of an inch thick, the truncated apex of which terminates in the central member of a hinge. This piece of brass is let in flush into the door-post, so as to be opposite the edge of the door, with the hinge projecting, and is firmly secured by a screw in the middle. A brass tumbler with a forked end is hinged to the truncated apex of the triangle, and this can be turned over on to the door when closed. As described so far, this device would not fasten the door, which would push the tumbler round on its hinge. To prevent this, a brass disc, with a small handle at one side and a segment cut off to form a flat at the other, is pivoted to the outside of the tumbler. When the handle is horizontal, the flat just clears the hinge on the triangular piece of brass; but, if it is desired to lock the tumbler, the handle is turned down, and the circular part of the disc enters a slot cut in the hinge, when the tumbler cannot be turned back to open the door. The same device serves to lock the tumbler back when it is not in use as a bolt. It is impossible to pick this device without cutting through the door, and it cannot be forced without actually breaking the metal. It will be noted that no attachment is fixed to the door. The device is made entirely of brass.

AUTOMATIC CAR SIGNALS.

Hand signals by the driver of a car to indicate imminent movements to following vehicles are liable to be misunderstood even in daylight; at night they are indistinct or well-nigh invisible. A device to show what a car-driver means to do next by means of words and arrows big enough to be easily read by day and readily illuminated by night has been recently introduced, and seems exactly to meet the requirements. Moreover, it is partly automatic, the signals 'slow' and 'stop' being operated by the foot-brake pedal and the side-brake lever respectively. Again, no extra lamp is needed for illuminating the signals at night, the device being a tail lamp and traffic warner combined carried on the rear lamp bracket. The signals are shown in a curved glass window in a brass cylinder. Inside is an aluminium cylinder, in which are cut the words 'slow' and 'stop,' and two arrows, one pointing to the right, and the other to the left. The outside of the cylinder

is enamelled red, while fitting the inside closely is an opalescent cylinder of celluloid. The results are, that white signals on a red ground are shown in the daytime and illuminated white signals at night, the lamp in the device shining through the opalescent celluloid. The inner cylinder is rotated by a toothed rack which gears with a toothed pinion on the spindle, the rack being pulled along against the tension of a spring which tends to rotate the cylinder in the opposite direction. A wire is attached to one end of the rack, by pulling which the cylinder is rotated to the desired signal. Comparatively small movements suffice, because the rack and pinion magnify the motion. The window, of course, faces to the rear, and by the side of it is a red window which acts as a tail light, while a lens in the end of the device projects a beam of light on to the number plate. The way in which this signalling device is worked shows great ingenuity. About half-way between the device and the dash-board is fixed a shallow rectangular box, in which is a flat sliding block. The rear end of this block is attached to the wire from the rack of the signal device, and it has just enough movement to rotate the cylinder through all the signals. Pushing a lever on the steering-column one way moves the block forward exactly the right distance to show the arrow signal to the left; pushing it the other way brings the arrow pointing to the right under the window. In each side of the block is a sliding plunger with a collar at the rear end which is normally up against the rear end of the block. At its forward end, each plunger comes against a stop after it has moved the correct distance to expose the signal 'slow' or 'stop' respectively. These plungers are attached by wires to the foot-brake pedal and the side-brake lever. Each control can act independently. If the lever on the steering-column is moved, the block slides forward along the plungers. If one of the plungers is moved, it draws the block forward, while the arrow control-pin slides in its slot. In fact, even if 'slow' or 'stop' is showing, the steering-lever can be worked and will turn the cylinder to a right or left arrow. Bowden controls are not used, but stout piano wires in tubes. The signal-box and other exposed parts are weather-proof, and are finished in black enamel or nickel plate. Finally, the device can be fixed on any car by a chauffeur mechanic, no drilling of the chassis frame being required. Means for adjustment and other refinements are fitted, but their description would take up more space than can be afforded in this note.

PAMPHLETS ON RURAL INDUSTRIES.

Anything that will be helpful to our rural population deserves a hearty welcome, and the Rural Industries Intelligence Bureau, 258/262 Westminster Bridge Road, London S.E.1, is

to be highly commended for issuing a series of pamphlets capable of being of great service to this section of the community. Copies of the pamphlets may be obtained from the Secretary at the above address, small numbers being available free, but a small charge being made where considerable numbers are asked for, especially when the pamphlets are of some length, and are fully illustrated. The pamphlets already issued are as follows. (1) 'Village Life and Country Industries' deals with some of the problems of rural industries, and indicates possible lines of development. (2) 'Straw Rope and Straw Envelopes' should be of interest to farmers as showing industrial uses for straw, and describing a profitable employment for country workers. (3) 'Peat Firelighters,' as its name indicates, shows how clean and effective firelighters may be made from peat. (4) 'The Village Blacksmith and His Outlook' indicates some ways in which the blacksmith may develop his trade along modern lines, giving details of equipment, and many other valuable practical hints. (5) 'Walking Sticks' deals with the manufacture of these customary aids to the pedestrian. (6) 'Suggestions and Opportunities for the Rural Woodworker' gives full directions, supplemented by working drawings, as to how simple household and domestic articles, outdoor and garden appliances, and even works of art may be constructed at home. (7) 'Hand Weaving and Spinning' treats of the practical problems which confront those who are taking up these crafts for a living. (8) 'Mat Making,' which is also illustrated, shows how simple coir and woollen mats may be made. (9) 'Compressed and Composition Firelighters' deals with the making of these useful domestic aids. (10) 'Rabbit Keeping for Fur' contains not only valuable hints, but also a list of suitable books and publications giving fuller information on the subject.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE YELLOW STREAK.

By JOCELYN HARCOURT.

CHAPTER I.

NOTHING displeased Jasper Leighton more than to discover he had erred in his estimation of a man's character, and apparently such an error now confronted him.

He stood in the manager's office of the El Chaco Railway Company, which overlooked the quiet, green circle of Finsbury Circus, a stalwart, well-groomed man in the early forties, and gazed with questioning eyes at his companion seated by the table. 'And that is your last word on the subject, Kent?' he asked at length.

'I think so, Jasper,' replied Kent Hume with a scarcely audible sigh of regret. 'Much as I should like to accept your offer, I fear it is entirely out of the question.'

As manager of the El Chaco Railway Company, Leighton had many opportunities of studying his fellow-men. In appraising their worth he seemed to possess an almost unerring instinct for singling out the right man for his needs, and it was this aptitude, combined with a sound, sympathetic knowledge of human nature, which had built up his reputation as a born leader of men.

'But why is it out of the question?' he persisted, after some moments' silence. 'You are a trained engineer, a keen disciplinarian, and, I firmly believe, just the very man to straighten out this tangle. The moment I was requested to engage a first-class engineer as superintendent of the line, I immediately thought of you; in fact, I half promised to get you. Mind you, the job's no sinecure; Mexican peons and the other flotsam and jetsam of the world that find a hiding-place in South America are certainly not the best types from which to turn out highly-efficient railway men; but you will have an entirely free hand—once you have removed the chaotic result of years of bungling, things should go smoothly enough. Why, old fellow,' he continued, his eyes sparkling with almost boyish enthusiasm, 'it's a man's job. Doesn't the rough-and-tumble of the struggle entice you? Can't you feel the blood rushing through your veins and your nerves all a-tingle when you think of the fight? Don't you positively itch to pit your highly-trained skill against the sloth and ignorance that you are up against?'

No. 692.—VOL. XIV.

Gad! what a chance you're missing—wish I had it!'

'Yes, it is a man's job,' replied Hume quietly, 'and that is precisely the reason why I cannot accept it. You and I, Jasper, have been real good pals ever since I was so high,' with his hand just above the table top, 'yet you appear to be entirely ignorant of my lifelong failing.'

'Oh, indeed,' remarked Leighton dryly; 'and that is—modesty?'

'No, *cowardice*! Deep down in my being there is a yellow streak somewhere, a bad streak, too, the realisation of which has permeated the whole of my life with its demoralising influence. As a tiny boy, when left in a darkened bedroom, I would lie shivering with terror until sleep mercifully came to my release; at school I suffered the petty persecutions of boys much younger than myself, because I lacked the necessary physical courage to resent them; and all through my life I have taken the line of least resistance, have avoided trouble—not a very difficult matter in these civilised days. Now, do you wonder that I shrink from an encounter with a gang of such lawless ruffians as you describe? Baiting a coward would be a very enjoyable pastime for them.'

Leighton studied Hume's five feet six inches of lithe, lean manhood with a frown of perplexity on his usually pleasant face. This man, with whom he had been intimate for many years, and for whose courage and resolution he would have unhesitatingly vouched, was now exhibiting unpleasant traits diametrically opposed to all preconceived ideas of his character. With a gesture of irritation he switched on the electric lights, and the shadows of the waning winter afternoon fled before their brilliance.

'No,' he remarked finally, 'you are about the last man in the world that I should have suspected of cowardice; in fact, I still find it difficult to believe, from what I know of you. Why, if I remember rightly, you were more courageous as a boy than any other fellow of our set. At swimming, for instance, you were out in the middle of the stream long before I dare leave the side, and I don't think that I was a funk even in those far-away days.'

[All Rights Reserved.]

MARCH 1, 1924.

'Bluff, old fellow; sheer bluff! I had one foot on the bottom all the time, and was in a state of sore trepidation lest I slipped.'

'H'm,' observed Leighton, non-committally; 'if you have always avoided strife, how do you know that the white feather would appear in a crisis?'

'How do I know—shall I ever be able to forget? Once the need for physical courage *did* arise, and . . .' Hume's voice trailed off miserably into silence.

'Well, what happened?'

'Only what you could expect. I followed out the habits of a lifetime, and gave the sorriest exhibition of funk that ever a man could give.'

'Come, let's have the yarn. Perhaps you are not the best judge of that;' and Leighton, a cigar well alight, settled himself comfortably in his swing-chair, and fixed his keen, deep-set eyes upon his friend's face.

For a little while Hume remained silent, as if collecting his thoughts, then with an effort he plunged into his story.

'You will remember that I went from school to Cambridge, where I took up the study of engineering at the pater's request. It was not my choice at all. My inclinations lay rather in the direction of art and literature, combined with an almost insane desire to travel; but the old man was so insistent on my taking up, as he termed it, a good, sound profession, that no alternative remained except to suppress my own desires and work hard. He died soon after my graduation, leaving me a considerable fortune, and when all was settled I left England for an indefinite period, my hopes realised at last. After three years of wandering up and down the world I visited the famous American seaside resort Palm Beach, in Florida, where I made the acquaintance of two English ladies, a mother and daughter, for whom I performed some trifling service.—Sure this is not boring you, old fellow?'

'Not at all,' replied Leighton. 'Go on.'

'Well,' continued Hume, 'with N . . . with the young lady and myself it was a case of mutual attraction, which speedily deepened into love; well, soon afterwards we became engaged. Then for some months we were deliriously happy, each day bringing us some new joy; days in which we talked of our ideals, our aspirations, our plans for the glorious future, and the dear, silly little topics of engaged couples all the world over, little dreaming that our airy castles were soon to be shattered. One morning we left with my future mother-in-law to visit some South American mines in which she held a big interest, and having some little knowledge of the country, I slipped a loaded automatic into my pocket as a provision for eventualities. The last few miles of our journey, which lay through rough, thickly wooded country, were performed

by coach, and whilst changing horses I amused my fiancée with a little shooting—you will remember, perhaps, that I am a fair shot with a revolver—and finally astonished her by hitting an ace at twenty yards.

"Now," she said, highly pleased with my success, "I am sorry for anybody that should attempt to molest us."

"So am I," was my vainglorious retort; for you must understand, old man, that braggadocio is one of the phases of this disease. Well, it came, just half-an-hour later, a regular penny-dreadful hold-up; one masked ruffian, with a pair of wicked-looking Service revolvers in the speaking part, and half-a-dozen rifle-barrels poking out of the undergrowth for the rest of the gang. He lined us up beside the coach, and though I had many opportunities, I could not for the life of me whip out that automatic and drop him in his tracks, but allowed the dirty old rascal to despoil us of every valuable we possessed.'

'That feeling I can quite appreciate,' interpolated Leighton quietly. 'To our highly civilised natures there is something very repugnant about the taking of human life in cold blood; but proceed—sorry I interrupted.'

'Going through my pockets,' continued Hume, 'he discovered that I was armed, and after unloading the automatic, handed it back to me with a sarcastic grin. "Say, bo," he said, "you didn't oughta pack a loaded gun; it mought go off some time—then it's trouble for yours."

'The remainder of that journey was marked by a strained silence, and on reaching their hotel the ladies bade me "good-bye" with an unmistakable air of finality. For two long, miserable days I wandered listlessly about, not daring to go near them, and when I finally plucked up sufficient courage to call, they had departed. The hotel clerk handed me a packet which contained the engagement-ring—my fiancée had contrived somehow to hide it from the old ruffian—some other presents, and a short note requesting me to release her from our engagement. And—that's all,' he ended lamely.

'What happened then?' queried Leighton, who had listened to this recital with keen interest.

'Nothing,' replied Hume dully.

'Nothing! Do you mean to tell me that you left it at that—all up in the air?'

'Well, what else could I do?'

Two straight, vertical lines appeared above the manager's nose, and his jaw set in a firm, hard line. 'See here, Kent,' he said crisply, 'that settles it. Ten minutes ago I did not give a tinker's cuss whether you took the job or not; now you've simply got to take it, if only for the sake of your own self-respect.'

'All right, I'll take it,' said Hume, after some consideration. 'If the men are as bad as you report, they will soon clear me out; but perhaps

I shall be able to set a few stakes for a better man to drive.'

'Good man,' replied Leighton delightedly, patting him on the back. 'I think you will need some shifting this time;' and immediately he plunged into a comprehensive survey of the details.

CHAPTER II.

THE El Chaco Railway Company, whose three thousand odd miles of shining steel rails serve every town of note in the major part of Northern Brazil, is perhaps the largest and finest railway system in South America. Every single rail of its almost endless track was laid under the personal supervision of Derek Walton, one of the most able railway engineers that England ever produced, a stupendous undertaking which brought him both fame and fortune.

From Para the main track runs in a gentle curve westwards for some thirteen hundred miles or more, almost to the borderland of Colombia, where it turns south for about a hundred miles, and then goes due east in another gentle curve, which finishes up at Para. Indeed, the whole system has the appearance of a huge ellipse portioned off by many branch lines which run across the depth of the ellipse.

Five hundred miles due west of Para, on the northern curve, at the junction of the Amazon with its tributary, the Tapahoz, lie the headquarters of the system, around which had rapidly sprung up the town of El Chaco. The shops, yards, round-houses, and cleaning-sheds covered an area of about two square miles; and high up on the hill-side, overlooking them all, was perched the superintendent's house, a well-built, commodious dwelling, named 'Eagle's Nest.'

The personnel of the staff was chiefly composed of Mexican peons, leavened by a few white men of doubtful character, who remained in the semi-seclusion of South America for reasons best known to themselves; and under the influence of the chief draughtsman, an unscrupulous American named Herman Dicksee, they ran the line more as a private venture of their own than as a well-conducted public railway system. Fortunately, most of the executive work was done by the London Board, which, having placed a resident engineer in charge, left the details of administration to his care, under the guidance of a local committee.

Culver Vane, Walton's right-hand man during the construction, was the first engineer to hold this post. He was a wide-awake young American, whose sterling qualities and incomparable ability in his profession had roused the interest of his chief, and paved the way to his promotion, a promotion he fully justified until stricken down by an accident, which for two years confined him to his bed, and finally led to his death.

During this illness the control of the system was virtually in the hands of Ezra Malcolm, the assistant superintendent, a tall, raw-boned Scotsman, who, though an excellent engineer, lacked initiative, and had no organising powers whatever. Thus, when deprived of Vane's guiding brain, he became merely a tool in the hands of the stronger-minded and more keenly-witted Dicksee. Malcolm's blustering manner strongly impressed the indolent committee of local shareholders, who, mistaking this bluster for ability, gave him *carte blanche* in all matters concerning the working of the line; and he was fast becoming a rich man, since much of the company's revenue found its way into the capacious pockets of himself and Dicksee.

Since the death of Vane he had confidently expected to be appointed superintendent of the line; in fact, he had already assumed full authority in anticipation, and with the American had concocted a nefarious scheme which would enrich them both still more rapidly.

One morning, during his tour of the shops, Malcolm was cursing fluently an insubordinate engine-driver, when a cablegram was brought to him.

'Expect this'll be the confirmation of my appointment as super,' he growled, tearing open the envelope. 'Well, of all the —— cheek!' and, turning on his heel, he stamped into the office, and slammed the door with a crash that shivered the glass panels to atoms.

'Say, Ez, my boy, you're some rattled,' drawled Dicksee, a sarcastic smile flitting over his beetle-browed, heavily-jowled face as he looked up from his drawing-board. 'What's bit you?'

'Here, read that,' said the Scot, throwing the cablegram on the desk.

Smoothing out the crumpled paper, the draughtsman read:

'Mr Kent Hume is appointed superintendent of the line. He leaves for El Chaco immediately with full powers. Writing.

'LEIGHTON.'

'Gee!' murmured Dicksee, with a whistle of surprise, 'that's got us beat all the way up; not much hot air in that proposition, brother. Who is this Hume fellow, anyway? Is he a member of the caboose?'

'Must be a new importation,' replied Malcolm. 'I don't know anybody of that name on the staff.'

'Waal, he's hiking so fast for this spot that you cayn't see his heels for dust, an' there's goin' to be a nice brotherly party when he does get here. What are you figurin' to do with that bunch of gold-ore which we lifted from the Sprite Mine, an' have got cached up in the storeroom? We cayn't move it before he hits the show, an' if he freezes on to it he'll can the whole shebang.'

'No, he won't,' retorted Malcolm grimly;

'not while I'm here. I've got this place under my thumb—the men will stand for me, I think—and what I've gone through to get this super's job nobody knows. Another thing, we haven't got enough out of that mine yet to pay for the breaking into it; we must rake

something more in, or we'll be out of pocket. If he makes any trouble, it's "good-bye" for him quick.'

'Say, that's the stuff to give 'em,' replied the American admiringly, as they went out to lunch.

(Continued on page 234.)

THE CHAPEL WITHIN THE TOWER.

By Major-General Sir GEORGE YOUNGHUSBAND, K.C.M.G., K.C.I.E., C.B.

PART I.

'There is no sadder place on earth.'—MACAULAY.

I.

ON Tower Green, within the inner defences of the Tower of London, stands a very ancient chapel, that of St Peter ad Vincula, which being interpreted means St Peter in chains.

The original chapel on this site was probably built by Henry I. (1100–1135). It was certainly in existence in the reign of King John, and Henry III., in 1241, gave instructions for certain repairs and adornments to it. Ten years later, bells for the chapel were ordered by the same king. But this earlier building evidently became unsafe, or not worth repairing, so that Edward I., in 1305, ordered a complete reconstruction. This is the chapel which now stands on Tower Green.

If there were no other record, the age of this chapel might be gauged by the fact that one has to descend four steps from the level of Tower Green to the floor of the chapel. An architect does not build the ground-floor of a church, or of any other building, below the level of the surrounding site. He either builds it above or, at least, level with it. From this it is apparent that the ground outside, in the course of centuries, has been raised several feet.

This is not difficult of explanation, for in old days people were not very particular about removing debris; so that if earth was dug out for foundations or for graves, or if buildings fell into disuse and decay, to save cartage and trouble such excrescences as lay about would, from time to time, just be spread about and smoothed over, thus again and again, by inches, during the centuries, raising the ground-level.

Architecturally, St Peter's ad Vincula has no great claims to distinction, but in human and historic interest it surpasses possibly any other place of devotion in the world. Its most historic period, viewed from the tragic aspect, lies between 1534 and 1747, some two hundred years, and it is this period which most attracts the visitor.

Just inside the entrance, on the left-hand side, is a brass tablet on which are briefly recorded the names of thirty-four historic personages. These are only a very small percentage

of those who reached their quiet rest in the old chapel, after passing through the bitter portals of the scaffold. Besides these greater dead, if so they may be called, hundreds of quiet citizens who died peacefully in their beds lie buried here. For after its tragic period the chapel of St Peter ad Vincula was used for several hundred years as an ordinary parish church, where those who lived within the Tower Liberties were baptised, married, and buried.

II.

The chief centre of interest lies within the altar-rails. Here were originally buried fifteen men and women—some queens, some dukes, some peers and peeresses, and some knights, but all of historic fame: Queen Anne Boleyn, Queen Katherine Howard, Lady Jane Grey, the queen of nine days; the Dukes of Somerset, Northumberland, Suffolk, Norfolk, and Monmouth; Countess of Salisbury, Viscount and Viscountess Rochford, Lord Guildford Dudley, the Earl of Arundel, the Earl of Essex, and Sir Thomas Overbury. These interments ranged from that of Queen Anne Boleyn in 1536, to that of the Duke of Monmouth in 1685.

But so obscured were these burials, perhaps intentionally, that the exact sites were often completely forgotten. Indeed, to obscurity were added misleading statements of a very pronounced nature. For instance, it is recorded that Queen Anne Boleyn was 'buried in the crypt.' Now the crypt of St Peter ad Vincula is outside the northern wall, and beneath the site of the older chapel before mentioned, and, needless to say, very far removed from the true burial spot.

It was not till 1876, under the orders of Queen Victoria, that a strong committee of experts was appointed to inquire into the whole matter, and definitely locate the true positions of these ancient sepulchres. The matter was indeed forced into prominence by the subsidence of graves about the floor of the chapel, as well as in the chancel, which made devotion not only unsafe but somewhat insanitary for the worshippers.

At a meeting of the committee, Mr A. B. Mitford, later Lord Redesdale, produced a plan prepared after careful historic research by Mr

Doyme C. Bell, showing the supposed places of burial of those who had been first laid to rest within the altar-rails.

According to this plan, the Duke of Monmouth, executed in 1685, lay lengthways underneath the altar. In the front row, and close to the altar, from left to right, were shown Lord Rochford, 1536; Queen Anne Boleyn, 1536; Duke of Somerset, 1551; Duke of Northumberland, 1553; Queen Katherine Howard, 1542; Lady Rochford, 1542; Countess of Salisbury, 1541. In the second row were shown Lord Guildford Dudley, 1554; Lady Jane Grey, 1554; Duke of Suffolk, 1554; Duke of Norfolk, 1572; Earl of Arundel, 1595; Earl of Essex, 1601; Sir T. Overbury, 1613.

The committee, opening up the flooring and examining the remains found, decided that this was a very accurate plan. But they also found that several later burials had been superimposed in this same narrow spot. For instance, Sir Allen Apsley, a Lieutenant of the Tower, and an ancestor of the present Earl Bathurst, had in 1630 been buried at the spot where Queen Katherine Howard lay. Mrs Hannah Beresford, who died in 1750, was found buried through and beneath Queen Anne Boleyn. Field-Marshal Sir John Fox Burgoyne, as late as 1870, had been buried at the spot where the Duke of Suffolk lay.

These later sepultures had not intentionally entrenched on hallowed ground; they were made in pure ignorance of the fact that the sites had been used before.

III.

It may be wondered how the committee, after a lapse of so many hundred years, was able to locate these ancient burials. The case of Queen Anne Boleyn may serve as an instance of the careful research and examination made by the committee. On opening up the pavement, and digging carefully down at the spot where Queen Anne Boleyn was held to be buried, two feet below the surface were found some human bones, neatly piled together. On digging farther down the lead coffin of Hannah Beresford came to view.

Those who had dug the grave of Hannah Beresford in 1750, finding older bones, had neatly piled these together, not in the least knowing to whom they belonged. These bones were sent by the committee to Dr Mouat, an expert in such matters. From his report it was manifest to the committee that these were, indeed, the bones of Henry VIII.'s second wife. They were, therefore, soldered up in a thick leaden coffer, which was placed in an oak box and fastened down with copper screws. On the box was placed a leaden escutcheon, on which was engraved the name of Queen Anne Boleyn, the date of her death, and the year (1877) of her reinterment. The casket was then buried four inches below

the surface at the spot where the remains had been found, and immediately cemented over.

The same procedure was followed in the case of the remains of six other bodies which had been exhumed and identified. It was, however, decided not to disturb the ground where Lord Guildford Dudley and Lady Jane Grey were buried, for fear of weakening the foundations of the heavy monument to Sir Richard and Sir Michael Blount, which stands against the north wall of the chancel at this spot.

The committee expressly recommended that the remains found should be reburied in the same positions they originally occupied. Yet the tablets now to be seen before the altar do not confirm this. It is, for instance, recorded that between the two queens—Queen Anne Boleyn and Queen Katherine Howard—the two dukes—that is to say, the Dukes of Somerset and Northumberland—lie buried. Yet the tablets show these two queens lying side by side, whilst the two dukes lie behind them, and separated from each other by a much later sepulture, that of Sir John Fox Burgoyne, in 1870.

It is perhaps now too late to correct this error, but if not, then assuredly the plan accepted by the committee of 1876 should be followed, and the fifteen original occupiers of these sites be recorded quite simply and plainly thereon.

A point which will be manifest to the least observant is that the original site before the altar must have been much broader than it is now; for from the foot of the altar to the first step down is only seven feet, whereas it is clear that to bury two rows of bodies, one behind the other, with their heads towards the altar, the space must have been at least fourteen feet, perhaps more.

IV.

Just inside the entrance-door, on the left-hand side, is the brass tablet before mentioned, on which are recorded the names of thirty-four famous or prominent persons who have died prisoners or have been executed, and are buried in the chapel. This list includes the fifteen persons already enumerated, buried before the altar.

The first name recorded on the brass tablet is that of Gerald Fitzgerald, Earl of Kildare, A.D. 1534. He was, even so long ago, the ninth earl of the title, which is now merged into that of the Duke of Leinster. Gerald Fitzgerald himself escaped the scaffold, dying as a prisoner in the Tower pending trial. But his son and his five brothers were all executed for indulging in that strange but perennial Irish pastime, 'rebellion in Ireland.'

The second name on the tablet is that of John Fisher, Bishop of Rochester, 1535; and next to him comes Sir Thomas More, the Chancellor. Both of these fell before the axe of

Henry VIII., who sanguinarily objected to prominent persons who would not acknowledge his spiritual as well as temporal supremacy.

Sir Thomas More's head, when severed, became almost as famous as himself, for it is still preserved in the vault of the Roper family in St Dunstan's church at Canterbury. It will be remembered that his daughter, Margaret Roper, bribed some one to tip the head off a spike of the gate on London Bridge, on which it was exposed, into the river, where she, in a boat, was ready to rescue it. The head is preserved in a helmet somewhat like those worn by knights of old, with an open grating in front.

Next we find George Boleyn, Viscount Rochford, and his sister Queen Anne Boleyn, both of whom suffered in 1536. Henry VIII., though a great king, was a savage fellow, and George Boleyn died chiefly because he was the brother of the queen, though to be sure the execution was justified by a monstrous charge.

Queen Anne Boleyn, whatever her faults, went to the scaffold to make room for another lady, on whom the large-hearted king had set his affections temporarily. Many strange things went with Queen Anne Boleyn, and followed her to her resting-place before the altar. As a special privilege, Henry VIII. allowed his queen to be executed with a sword instead of with the axe, as was usual. There being no skilled executioners with the sword in England, the services of a Frenchman from Calais were obtained. The execution duly took place, but, perhaps because every one firmly believed in a reprieve, no coffin had been provided. Thus when the spectators had dispersed in horror, the queen's ladies were left standing on the scaffold, bitterly weeping by the decapitated body of their mistress, and wildly wondering what next to do.

Seeing their distress and dilemma, a yeoman warder ran across to the armoury close by, and thence obtained a long elm-wood chest, usually employed for storing arrows. Carrying this across to the scaffold, he helped the weeping ladies to place the queen, with her head beside her, in this arrow-chest. And thus was she buried, as we have seen, to the north-west corner of the altar, and so hastily that only two feet of earth were removed.

Next on the list is Thomas Cromwell, Earl of Essex, 1540, who, only four years before, had assisted in bringing about, and sat as a witness at, the execution of Queen Anne Boleyn.

Then comes Margaret of Clarence, Countess of Salisbury, 1541, whose perhaps gravest offence was that she was the last of the Plantagenets, and thus just as well removed out of the way. But it must be allowed that she was a somewhat turbulent old lady, and, as we say nowadays, was perpetually asking for trouble.

It was an understood agreement between the executioner and the person about to suffer that

the latter should be excused the indignity of being bound, on condition that he did not obstruct the executioner in his duty, or place any difficulties in his way. The Countess of Salisbury was seventy-one years of age, and evidently at the last moment lost her nerve, for instead of placing her head on the block and keeping it there, she jumped up and declared that she had done nothing to deserve this fate. According to the historians, a horrid scene ensued on the scaffold before the executioner succeeded in fulfilling his duty.

Queen Katherine Howard, who comes next, was another of Henry VIII.'s wives who made room, by way of the scaffold, for yet another queen, and lies, as we have seen, before the altar. Her lady-in-waiting, Viscountess Rochford, a sister of Anne and George Boleyn, was executed at the same time, and lies near her.

Next we find inscribed Thomas, Lord Seymour of Sudeley, the Lord High Admiral, and his brother Edward Seymour, Duke of Somerset, the Lord Protector; the former executed in 1549, the latter in 1551.

V.

Sir Thomas Arundel and Sir Ralph Vane, both executed for treason, come next. According to Machyn's 'Diary,' 'The xxvj day of February (1552), the wyche was the morow after Saynt Mathewe day, was heddyd [beheaded] on the Towre hyll, Sir Thomas Arundell, and incontinent was hangyd the seylf same tyme Sir Raff A. Vane, Knyght, after, ther bodyes wher putt into dyvers nuw coffens to be bered, and heds, into the Towre in cases, and ther bered.'

Next on the tablet comes a regular family holocaust. John Dudley, Duke of Northumberland; his son, Lord Guildford Dudley; his daughter-in-law, Lady Jane Grey; and Henry Grey, Duke of Suffolk, father of Lady Jane Grey. These all in 1553-54.

Thomas Howard, fourth Duke of Norfolk, 1572; Sir John Perrott, 1592; and Philip, Earl of Arundel, 1595, follow. Then Robert Devereux, Earl of Essex, 1601, on whom Queen Elizabeth lavished much motherly affection, and whom at length, with many tears, she sent to the scaffold.

Robert Devereux, Earl of Essex, is the only man who was executed on Tower Green, in what was known as the comparative seclusion of the Tower. In all, only six persons are recorded as having been granted this privilege—Queen Anne Boleyn, Queen Katherine Howard, Lady Jane Grey, the Countess of Salisbury, Viscountess Rochford, and Robert Devereux, Earl of Essex.

Sir Thomas Overbury was one of those who were murdered in the Bloody Tower, and helped by his death to give that sinister title to this ancient building. It is said that twenty-three poisons, including powdered spiders, were

tried on him without killing him, and that then a violent dose of corrosive sublimate was administered. To drown his groans, as well as to hasten his end, a pillow was pressed over his face to suffocation.

Thomas, Lord Grey of Wilton, 1614, was taken out to be executed at Winchester, there being smallpox in the Tower, but was reprieved on the scaffold, and ordered to be imprisoned for life in the Tower of London, 'in the small chamber over the gate.' This small chamber still exists over the Traitor's Gate, and is included in the quarters of the Keeper of the Jewel House.

Arthur Capel, Earl of Essex, 1683, was either murdered or committed suicide in the same house on Tower Green where Lady Jane Grey was imprisoned. The evidence would point to the former conclusion, for the earl's throat was cut with a razor, and the razor was thrown from the window out onto Tower Green. A man who had cut his own throat would hardly be in a condition to do this.

It is striking how many Earls of Essex, all of different families, have had tragic connection with the Tower of London:—

Geoffry de Mandeville, Earl of Essex, Constable of the Tower, who was killed by King Stephen's troops about the year 1143-44, whilst 'engaged in the more lucrative profession of highway robbery.'

Thomas Cromwell, Earl of Essex, who, after rising to the highest power in the reign of Henry VIII., came to the block on Tower Hill.

Robert Devereux, Earl of Essex, the spoilt

child of Queen Elizabeth, who outbore his sovereign's patience, and ended his days on the scaffold on Tower Green.

And, lastly, Arthur Capel, Earl of Essex, who was murdered in the gaoler-warders' quarters in the Tower of London in 1683. The present Earl of Essex, who spells his name Capell, is a descendant of this last.

Amongst others on the brass tablet may be seen the name of George, Lord Jeffreys, 1689. This was the notorious Judge Jeffreys of the 'Bloody Assizes,' which followed on the Monmouth rebellion. Judge Jeffreys was captured when on the point of making his escape to France, and was imprisoned in the Bloody Tower awaiting trial. There, however, he escaped both trial and the scaffold by drinking himself to death. He was first buried before the altar, but three years later it was thought more seemly to remove the body, and place it amidst less dignified surroundings in St Mary's, Aldermansbury.

The last four names on the brass tablet are those of the Scottish lords who took a leading part in the rebellion of 1745. Of these, the Marquis of Tullibardine, who was very ill and exhausted when captured, died after being a prisoner in the Tower for three weeks. The other three lords were executed on Tower Hill, and buried, as later mentioned, at the foot of the brass tablet. In all, it may be repeated, there are thirty-four names on the brass tablet, ranging from the Earl of Kildare, 1534, to Simon, Lord Fraser of Lovat, 1747.

(Continued on page 229.)

SAILING-DAY INCIDENTS.

By IAIN MUNRO.

IT has been said that people must be seen or met in their own homes, preferably before breakfast, ere an estimate can be made of some of their good or bad qualities. The taking of such a step is not always possible, nor at times desirable; but, from what I have observed, I find that the conduct of passengers on a sailing-day is a fairly accurate index to their characters, in so far as they are likely to affect a ship's staff during the voyage.

I meet so many people in the course of my duties that it would serve no useful purpose if I were to try and remember them all. Nevertheless, I have inaugurated a private recording system or memorial chart, whereupon I plot, graph-wise, in units of desirability or the reverse, the position of some of those with whom I come in contact, together with an account of the action which entitled them to such notice.

I take a random glance at my chart, and memory bestirs itself.

Our ship lay in New York one Saturday last

summer, and was due to sail at noon. About nine o'clock the various officials began to assemble at their stations on the dock, preparing for the embarkation of passengers. The winches rattled as the baggage and remnants of cargo were being slung hurriedly on board; orders from some of the shore staff reverberated convincingly; the air was tense with excitement and suspicion; but the sun shone brightly, and, apart from the chilling effect of officialdom, the morning gave promise of going merrily past.

Most of the passengers had arrived on the dock by half-past nine, some accompanied by friends, others alone. Those of them who had travelled before looked around with a critical, self-possessed air, and disposed themselves conveniently near the gangway, wherefrom they commented upon the methods of embarkation employed on other and larger ships. Others showed evidence of having come from far off the beaten tracks, and kept deploying hither

and thither, partly from excitement, but mostly through the importunity of well-meaning friends.

There was weeping when adieus were being said; but I noticed with regret that a good deal of it was camouflage. Real sorrow, expressed by the shedding of tears, is very touching; but on a sailing-day there is so much make-believe that I am ill-disposed to become enthusiastic about any one under fifty who goes to such an extremity without reasonable provocation. I once saw a Turk weeping profusely whilst fumbling for a dagger; and not infrequently have I met people who shed tears of pity for themselves after having reached a certain stage of intoxication. The sympathies of the latter are inexplicably conservative, and are not usually shared, I imagine, except by those who are a little daft.

My attention was diverted from those who wept by a woman of large proportions, who kept elbowing her way among the crowd, as if looking for some one. She glared fiercely at those against whom she bumped, but most of the others showed their good judgment by making room for her when possible. For a time she threatened to monopolise the dock, but Nemesis was not to be thwarted. In her path stood a small boy with a teddy-bear and two rubber balloons. Somehow or other the balloons became entangled about the lady's ankles, and in trying to shake herself free she trod on one of them, which exploded with a loud report. There was a titter of amusement from the crowd, but the shock proved too much for the lady, and she swooned luxuriantly into the arms of a policeman, who propped himself and his load against a stanchion, awaiting developments. Some one quickly produced a glass of brandy, and a few drops of it sufficed to restore the lady's animation. She opened her eyes, and, beaming on the good-looking policeman, asked him, banteringly, if he remembered ever having had such an armful before. With modest, but uncompromising, gallantry he replied, 'Not upon so short a notice, madam.' It was sailing-day, however. There might be amity, but certainly no equivocation so close to the gangway, and a timely recollection of the words of an old song caused him to murmur, 'But it's all over now, dear; it's all over now'; upon hearing which, the lady almost fainted a second time.

What a rollicking prelude to any embarkation!

Before passengers are allowed on board, they must produce evidence of having been considered fit and proper persons to travel; and the documents most necessary in this respect are a steamer ticket and a passport which has been viséd by the recognised consular officer. An elementary understanding of the laws of contract and sale is generally enough to convince people that the money paid for their tickets shall, with reservations, entitle them to transportation from one port to the other, that they shall have

allotted to them so many cubic feet of space, and that they shall eat and drink within certain hours. On their part, there shall be expected a general conformity to the necessary ship-board rules, from the rising of the sun even unto the going down of the same, and whether in the glare of the electric light, or in a shaded corner with agreeable company.

The passport discloses to view what some people like to consider as secret. Among other particulars, it specifies, dispassionately, a person's age and general appearance, which information is supplemented by an attached photograph. It also gives some indication of immediate perambulatory intentions, but does not stipulate as to how often the mind may be changed. The system has its advantages and drawbacks, but, however reluctant people may be in revealing this much of their private history, it can hardly be denied that such a revelation helps them to become better acquainted with themselves; and in the end, they may even discover that they are really more interesting than at first they thought they were. Some, of course, are disagreeably surprised, like the man who mistook a rattlesnake for a mongoose.

The embarkation proceeded briskly, however, and by eleven o'clock most of the passengers had come on board with their bags and band-boxes, favourite cats and canaries, baskets of flowers, and flagons of 'apple-jack.' They represented many grades of society from different nations, but the majority could not adapt themselves to their new environment without expressing wonder as to what kind of ship they had boarded.

Elderly people sauntered around the deck, while the younger and more restless ones wrote whimsical letters in the writing-room. A group of spectacled, noisy college girls romped from one end of the deck to the other, followed by some male admirers in coloured sweaters. They swept haughtily past the deck-steward, and kept repeating verses in Latin. While the ship was moored alongside the dock, they were cheerful enough in their own way; but how different they looked three days later, when the vessel rolled in a nor'-west swell! The flowers began to lose their bloom, and, with drooping petals, lay limp on the deck-chairs. How refreshingly impartial is a touch of sea-sickness!

I walked once round the deck before going downstairs, and, looking over the rail onto the dock, witnessed an interesting piece of acting. A young lady had been weeping bitterly while saying good-bye to her husband, but about the end of every fifth second she raised her head from his shoulder and cast her eyes around the dock. This was repeated until eventually a young man edged forward behind the husband's back, and held out to the lady a gold-mounted fountain-pen. Her sobbing became more violent as, unobserved by her spouse, she reached out

her hand and grasped the souvenir from her peripatetic admirer. Then, no sooner had the husband gone to look after his lady's baggage than she and the venturesome new-comer became locked in each other's arms. I viewed the scene with mixed feelings, and wondered when the husband would return. They had scarcely become disentangled when he arrived; but, apart from giving a readjustment to his spectacles and a keen glance at his wife and her friend, he showed no other signs of disapproval. On the voyage across the Atlantic, the lady explained to me that such was her method of testing her husband's good-nature. I hinted at the potentialities of even a slight anachronism where such tender feelings were concerned. She inclined to agree with what I said, but was modern enough not to waste many elegant words in expressing her appreciation of my argument. If 'my lady' does not take heed, she may find out, like the 'Persian kitty of pedigreed fame,' that her 'primrose path' winds closer to a precipice than she thinks.

I went downstairs, and had scarcely been seated when a man dressed as a cleric stalked into my room without knocking, and fixed a threatening eye on me. His baggage could not be found, and he was obviously in a bad humour — 'there was a knot on his galluses!' The garb he wore certainly betokened peace and good-will, but his attitude was strikingly militant. What he wanted was immediate satisfaction, and in order to be emphatic he banged his fist on the desk with so much energy that the 'Baby Ben' clock and an ink-bottle leapt into the air like a pair of frightened roes on Mount Lebanon. A thump on the pulpit may startle a drowsy congregation into a show of attentiveness, and perhaps disturb the little bats a-slumbering in the belfry; but such evidences of lack of restraint shocked some of my old-time notions of propriety, and I began to wonder if it were a case of 'the broken bridge is falling down, my fair lady.' However, the wrath of my visitor died away very suddenly. There was a suspension of warlike activities, and, before the trip was over, we had read a portion of Virgil together.

Sailing-hour had almost arrived ere the disputatious 'lad in black' took his departure, and I had begun receiving farewell visits from some of the various landward officials. With few exceptions they were men who respected law and order, although they felt indisposed to allow the dispensations of some forensic mind to interfere with their partaking of a surreptitious refreshment 'on ship's account' in the purser's room. The various brands were admirable, and suitably commented upon; but there was no time for palavering, as the bugle had sounded 'All visitors ashore.' Courtesies were exchanged with a crisp sincerity, and in a few minutes I was left alone among empty bottles and clouds of tobacco smoke. The gangway was shortly afterwards

hauled ashore. A flutter of handkerchiefs on the quayside was answered from the railings around the deck, as the siren roared a farewell to the great city and friends who were being left behind.

To a ship's crew, one sailing-day is, in most respects, similar to any other, and the one at issue differed from the penultimate one only in that there was no discovery of stowaways. They, of course, are a people apart, and, like a flock of wild geese or a fancy waistcoat, attract a good deal of notice. As a rule they appear singly from time to time, although multiples of four have become fashionable of late. Those ill-advised men must surely have decided upon having a pitch-and-toss with Fortune before having heard of the frog that jumped into a well and could not get out. If they had been like some of their non-stowaway contemporaries and studied the more genteel forms of deportment which are so depressingly noticeable on sailing-day, they might at least have aroused the same amount of interest without putting themselves and others to so much inconvenience.

After all, the stowaway instinct is in the most of us, whether we care to admit it or not. Some people like to stow away their wealth in a bank or a purser's safe; others are content to stow themselves amongst the branches on 'the tree of the knowledge of good or evil,' wherefrom they send out, tentatively, their clarion calls to saint and sinner.

But enough! Sailing-days shall doubtless continue to be arranged; some people shall frown or smile as occasion requires, whether they believe in ultra-violet rays or 'multiply visions and use similitudes'; yet, for all that, the earth shall swing none the less merrily on its axis although they and we are no longer available to witness the hoisting of the 'Blue Peter.'

FATIGUE.

I AM too tired, too tired to-night,
To join in all the birds' delight,
Or homing vespers of the bees:
May God accept my litanies!

For I am tired by day's long stress
Of duty—yet no bitterness
Shall soil my silent ecstasies,
Who watch the gold moon through the trees.

The rising moon, whose veil divine
Is spread o'er tired souls like mine—
She swings her censers through the night
To keep the earth's dark altar bright.

The scented silence of the flowers
Distils sweet peace, renews the powers
Of toiling, tired humanity—
The breeze chants 'Benedicite!'

CONSTANCE FARMAR.

HUNTING THE HUNTER.

I.

WITHOUT intending to belittle, in any way, the tiger-shooting exploits of our Royalty in India, it is well at the same time to remind the average reader that expeditions 'made to order' on such an extensive scale lack much—if not all—of that real thrill of adventure which is the heritage of the pioneer and the lone camper in the wilds. 'Tiger-stunting,' as the Americans call it, has little to recommend it to the true sportsman. Two or three hundred native beaters encircling the quarry—shouting, yelling, and beating tom-toms—suddenly turn the silence of the shadowed jungle into a howling pandemonium, forcing a badly-scared frantic tiger to face the open, there to be met by a barrage of death from the most modern lethal weapons, handled by the best shots in India. The 'hunters,' too, are invariably mounted on well-trained elephants, any one of which is capable of treading 'Stripes' underfoot and crushing him to death.

Vastly different are the conditions under which the average pioneer meets the wild denizens of the forest; and it is in the experiences of those solitary souls, who blaze their lonely trails through virgin forests and along the untrodden mountain-side, that we must seek if we would understand truly the attitude of savage Nature, 'red in tooth and claw,' toward mankind in general and the hunter in particular, when she encounters them face to face on the threshold of her realm. The proud 'Monarch of Creation,' as he styles himself, pays fearful tribute to his indiscriminate 'subjects,' and the toll of human life exacted annually by snakes, lions, tigers, and wolves alone affords staggering statistics.

The 'surprise attack' is undoubtedly the most efficient weapon of the animal world. It is not always, however, an essential to victory; as has been proved again and again when the roused jungle-dweller, wounded or at bay, has turned on his pursuers and launched an attack so irresistibly furious that the hunter has become the 'hunted,' and often the erstwhile prospective victor, the victim. Doubtless, in the majority of cases man emerges triumphant from such a conflict; but the forest glooms, the sun-baked llanos, the reeking swamp and silent sierra, hold the grim secret of a thousand combats, whose culmination of horror leaves only a rusting rifle or a broken spear to tell the tale. In the eternal war between man and 'the armies of the wild,' the element of the 'unexpected' is a most potent factor. A momentary hesitation—one single error of judgment—has often sent the proud possessor of the deadliest weapons scurrying to the tree-tops for safety, or in vain flight from an inevitable death.

II.

Mr Frederick Hand, an ex-official of the Beira Railway Company, tells of such an experience. 'We had stalked our quarry—a lion and a lioness—for nearly three hours, and the "going" had become difficult. Our trail had led us into a maze of boulder-strewn kopjes and fallen rocks, and, as the sun had already set, I decided to abandon the chase and pitch camp for the night. We called up the carriers, and proceeded to unpack. Jorami, my chief native hunter, who had been standing near me, moved off a few paces, presumably to reconnoitre, and what happened in the next few moments survives in my memory as a kind of hideous nightmare.

'From the grass, almost at my side, a snarling roar rent the drowsy silence of the forest, and the next instant two great tawny bulks, hurtling past me through the air, appeared to launch themselves upon the back of the unsuspecting Jorami, and disappeared, all three, headlong into a patch of tall "elephant grass."

'I ran forward and, risking the shooting of my hunter in that desperate moment, fired point-blank into a whirling mass of dust and leaves, not twenty yards away. The effect was instantaneous. Like a flash the lioness was upon us! So sudden was her attack, and so lightning swift were her movements, that three of my "boys" went down like ninepins—one killed outright, his skull crushed like an egg-shell, while two others lay torn and bleeding—before, with a well-placed shot, I succeeded in stopping that murderous onslaught.

'Leaving my carriers to do what they could for their unfortunate comrades I called my "second" hunter, and rushed to where I had seen Jorami and the lion but a moment before—both were gone! We scouted frantically around in the gathering darkness, shouting aloud in the hope of receiving some sign of his whereabouts, but in vain; and as it was now too dark for "tracking," we returned and camped for the night on that ill-omened spot. And such a night! The low, wailing, death-croon of the Mashonas, the groans of my suffering carriers—for whom I could do little—the howling of the jackals in the darkness close by, and the hideous "huh-hoo-hoo" of the circling hyenas, made in the inky blackness of the tropic night a perfect hell!

'But worse was yet to come. Toward midnight came a lull in that dreadful chorus; and my "second" boy, springing to his feet, seized me by the arm, whispering excitedly, "*Mfumu! Mfumu! Uumva?*" ("Master! Master! Do you hear?") I listened, and, sure enough, from somewhere out in the darkness beyond came the muffled snarl of a lion. Followed a moment of

silence; then all at once on the night air rang out such a scream as froze the blood in my veins and sent a cold shudder of horror through me from head to foot. The scream of a man! One long wild shriek of fear and agony, suddenly throttled into silence, and all was still.

'Through that long night I watched and waited beside the dead and dying, and at the first streaks of dawn picked up the trail. We followed the tracks easily through the long grass and found, not two hundred yards from where we had camped, ample evidence of Jorami's awful fate.'

III.

Even in the 'safer' methods of big game shooting, such as trapping, baiting, &c., the unexpected and unforeseen often turn what looked like an easy 'kill' into an adventure brimful of peril and possible tragedy. In 'baiting' for lions or tigers, the usual method is to fix some tempting morsel within twenty or thirty feet of a suitable tree, from the branches of which the 'baiter,' safely ensconced, kills his unsuspecting quarry.

While it is true that the hunter may spend night after night in fruitless and uneventful vigil, it is also possible that his first 'bait' may bring the watcher one crowded hour that will satisfy his thirst for excitement for some considerable time.

M. Oscar Roland, a traveller and hunter well known along the Congo, had an experience which I think few would care to emulate. Finding some fresh lion tracks on the margin of a pool in the jungle, he set his 'bait'—a mangy native cur—in a likely spot within point-blank range; and, mounted in the fork of the tree about twenty feet from the ground, awaited results. It was bright moonlight, and several hours passed with no sign of any ravening carnivora appearing to silence the howling bait, when a sudden rustling in the undergrowth near the foot of the tree caught his ear. Peering cautiously through the foliage, he saw the brushwood parted, and out into the open, one after the other, shambled three huge gorillas, appearing to the startled eyes of the beholder even more monstrous and abhorrent in the moonlight.

His position was one of imminent peril; his lofty perch was no safeguard against the simians—rather the reverse—and his Martini rifle an altogether inadequate weapon for an encounter with three such adversaries. The fates, however, had worse in store for him. Drawing back silently and cautiously into the thick foliage his foot slipped, and as he clutched at a bough to save a fall, his rifle dropped from his grasp and clattered noisily to the ground!

On the instant, startled by the sound, the largest of the creatures wheeled and charged! The unfortunate dog lashed to the stake was the object of his wrath, and the next moment

the watcher, from his screen of leaves, gazed in mute horror as he saw his 'bait' being torn in pieces and scattered to the winds like so much cotton-wool! This accomplished, but evidently still suspicious of the proximity of an enemy, the great brute sniffed the air and peered slowly and carefully round, searching the shadows with wicked, twinkling eyes, then, apparently satisfied, shuffled off into the darkness, leaving M. Roland breathing a prayer of heart-felt relief.

IV.

In June of 1901, while stationed at Mtoche, I had an experience which twenty years have not effaced from memory. A great troop of baboons, some of them the biggest I have seen in Africa, appeared close to our camp, among the trees in a dry river-course, in the late afternoon. I called together half-a-dozen 'boys,' armed with axes and choppers, and, taking my Lee-Metford, sallied forth, picking our way carefully down into the valley, to get as near to our objective as possible. On reaching the trees, however, we found the baboons had beaten a retreat, and were scurrying into the shelter of a great cane-brake on the other side of the river. We were soon in hot pursuit. The undergrowth between the bamboo clumps being easy to negotiate, we quickly overhauled their rear-guard—a dozen big surly dog-baboons—past-masters in the art of woodcraft, and adepts in covering a retreat with that elusive cunning that always seemed to keep them just out of range. It made little difference whether we advanced slowly and cautiously or on the run; always the tawny creatures seemed to be just disappearing round the boll of a tree or vanishing into the bamboos as I raised my rifle.

It was an eerily silent chase! Only at odd intervals a warning bark from some big-voiced baboon told us we were still on their trail—otherwise that host of two or three hundred simians was speeding through the valley with a noiseless haste that had to be witnessed to be believed. We followed them for close on an hour without so much as even a chance shot. Then suddenly the scene changed! From straight ahead of us, and on our flanks to right and left, broke out a fierce barking chorus that took us completely by surprise. A great crashing in the bamboos that momentarily grew louder and nearer, and next moment my two 'boys' who had been pushing on ahead burst through the brushwood, their eyes bulging from their sockets, and terror writ large across their faces as they rushed past us, yelling as they ran, '*Nyalugwi! Nyalugwi!*' ('Leopards! Leopards!'), and vanished in the direction from which we had come.

In a flash I understood. We had chased our baboons slap into a family of three or four leopards, and these, attacking at sight, were driving the simians right back upon us, the

latter evidently concluding that of the two foes we were the less formidable.

My 'boys' were already well on the run, and as I started after them I must confess to a sensation as nearly approaching panic as ever I felt in all my experience of bush life. As I ran and stumbled through the undergrowth, the gray and tawny brutes plunged past me to right and left, and time and again some fierce dog-faced old warrior would halt—only a few feet away—every hair on his body bristling with rage and fear as he glared at me, then, evidently puzzled and uncertain, would give vent to a savage bark and hurry on.

I knew that at such moments my life hung in the balance, as it only required one more daring than the others to lead the attack, and short shrift would be mine! The few rounds in the magazine of my rifle would have been little use against the host of frantic creatures that were now streaming past me on all sides. Fortunately for me, my 'water boy,' with more consideration than his companions, kept pacing on just ahead of me, and piloted me to the crossing at the river, and safety.

Being a Scotsman, I suppose it is only natural that it took me some time to see the humour of the situation; but I often smile when I think of the picture we must have made, tearing hot-foot in retreat (not 'according to plan') before the chattering troop we had been so valiantly chasing through the bamboos but an hour before.

v.

This unexpected 'butting in' of a third party into the hunt is a common source of trouble to the hunter, and may even lead to disaster. Mr Philip Pretorius, traveller, trader, and hunter, and one of the best shots in Africa, can vouch for this from more than one experience.

Once, while camped on the Mazoe River, south of Marimas, he discovered a small island separated from the shore by some two hundred yards of shallow water. The grass on this little oasis, being always fresh and green, made it a favourite feeding-place for all kinds of game, especially after nightfall.

His 'head boy,' Safari, having been instructed to do some shooting for the 'pot,' set out, accompanied by two cattle 'boys'—just before moonrise—and crossing the shallows in a canoe, lay concealed in the rushes waiting the arrival of the 'game.' In a short time the sound of some creature entering the water reached their ears, and, as the splashing slowly grew nearer, Safari gripped his rifle and stood erect in readiness to shoot. Here, however, our hunters received a shock when from out of the darkness—not fifty yards away, and evidently drawing nearer—came a deep rolling growl that suddenly swelled into the full-voiced roaring of not one, but two or three lions.

In an instant the rowers were paddling frantically for the deeper water on the other side of the island. But again the inexorable fates took a hand in the game! From the black waters—so close as almost to overset the canoe—rose the gigantic head and shoulders of a hippopotamus, and before the rocking craft could be swept clear, or its occupants leap to safety, the great dripping jaws had opened and clashed, and the mangled body of Safari—torn almost in two—was floating away into the darkness. The two remaining 'boys,' half crazy with terror, plunged into the river, and eventually reached camp in safety with the news of Safari's fate.

vi.

Another well-known danger, one which the 'bushman' never forgets, is the fact that all the while he is tracking down his quarry or stealing cautiously upon his unsuspecting victim he, too, is being trailed and stalked by wild things whose ancestors were masters of that art countless years ago.

One incident as related to me by Mr F. C. Selous, when I met him at Karonga some twenty years ago, may serve to illustrate this point. He had strolled out from camp in the cool of the evening, taking with him for companionship a young brindled bull-dog—a present from a Livingstonia missionary. He was unarmed, and on coming upon some freshly-made 'spoor' or hoof-prints, evidently of big game, it was inexcusable in a hunter of his experience to attempt to track them any distance; but, as he himself averred, his action in doing so was prompted by sheer force of habit.

The trail lay through a small *dambo* or sun-baked swamp, and Selous had not gone far before he observed an unaccountable anxiety on the part of his dog to return to camp—or so at least it seemed. Wonderingly—for the dog was of good pedigree and an indomitable 'fighter'—he undid the leash, and with a plunge the animal disappeared into the 'scrub.' Next moment, from a swirl of grass and flying dust not twenty feet away, came the deep-throated growl of the dog, mingled with the fierce guttural snarling of a leopard, and the astonished hunter caught glimpses of 'Spots' as he spun round in circles, biting and clawing at lightning speed, frantically endeavouring to shake loose the iron jaws that held his throat. But bull-dog courage was of little use against those thews of steel and terrible claws! By the time Selous had raced back to camp and returned with his gun that battle-royal was over, and a single shot at close range brought down a badly shaken leopard, to whose throat still clung a dead and almost disembowelled bull-dog.

It must be evident, then, that mere 'killing' on a grand scale is not 'hunting.' The cushioned

'howdah' is an entirely different proposition from the fork of a moss-covered tree, every crevice of which is teeming with insect life, noxious or otherwise, and up the trunk of which at any moment may swarm an army of 'fighting' ants, whose advance nothing can stay, and whose bite is unendurable. The trailer dangling from the branch above you may be the tendril of some giant creeper, or it may be a pendent green 'mamba'—the deadliest snake in Africa! I have witnessed the somewhat incongruous

spectacle of an elephant hunter, carrying a '450' Express rifle, 'beating it' at top speed before the onslaught of a score of giant bees!

The foregoing are, of course, only a few of the innumerable and unforeseeable surprises that await the hunter whose way lies through those lonely fastnesses of the 'Wild' where intellect is pitted against instinct; mechanism against muscle; where the far-flung outposts of civilisation advance rough-shod, foot by foot, in their age-long campaign of death and extermination.

A GIPSY OF THE NORTH.

By OTTWELL BINNS, Author of *A Mating in the Wilds*, *A Hazard of the Snows*, *Clancy of the Mounted Police*, &c.

CHAPTER XI.—AN ATTACK IN THE NIGHT.

AS Standifer gave vent to his cry of amazement Norma Mannering started forward, and then as suddenly checked, shot the newcomer a strange look that might have been one of loathing, and, turning aside, walked deliberately away from him. Standifer noted her action, laughed, and turned on the bedraggled Carwyke. 'How did you get here?' he demanded harshly, surveying the other with keen eyes.

'On a raft,' answered Carwyke. 'Over the falls.'

'Over the falls?' cried Standifer in amazement.

'Yes,' replied Carwyke simply, his eyes on the girl, who with her back to him was looking down the river, as if utterly indifferent to his presence.

The amazement Standifer felt was revealed in his face as well as in his voice. For a second or two he stared incredulously at Carwyke, then he gave a sharp laugh, and half-turned to the man with whom he had been talking at the moment of Carwyke's unexpected appearance. 'You heard that, Mardock?'

'Yes,' answered the other, staring at Carwyke curiously. 'Another illustration of the time-worn adage, "A man who is born to be hanged will never be drowned," I suppose.'

Standifer looked up the river. 'I wouldn't have believed that any man could have come through that,' he said wonderingly.

'May be lying, you know,' commented Mardock carelessly.

'The question is, What are we going to do with him?'

'What can you do, Standifer?' asked the other quietly. 'You can't shoot him in cold blood, or leave him to die of starvation in the wilderness.' He broke off and looked up the valley in the direction of which they had been staring at the moment of Carwyke's advent; then he added in a half-whisper, 'Better take

him along with us. He'll even things up against those treacherous dogs.'

Carwyke, exhausted though he was, and almost indifferent as to what might happen to himself, caught the half-whispered words, and of the suddenest grew intensely interested, though he masked the interest behind a face that was full of weary unconcern.

'Who knows?' said Standifer doubtfully. 'He might take sides with them.'

Mardock shook his head. 'Not he. Carwyke's not the man to play procurer to a pair of filthy blackguards, by whose company even I am disgraced. You've got to make terms with him or let those rascals shoot him, Standifer; and if you do the latter the girl will be a witness against you.'

'But—'

'If there's any shooting I drop out of the game,' interrupted Mardock truculently. 'My neck's not worth very much, but I have still a use for it; and I am taking no risk of forfeiting it for a whim. Bring Carwyke along with us. I imagine he can do no particular harm; and, remember, you can shed him any moment that you like.'

Standifer considered the matter carefully for a moment, then he nodded his head. 'Perhaps you're right, Jim. If it comes to a show-down with those beggars up there he would be useful.' He turned to Carwyke. 'You hear, Carwyke; I am inclined to take you along, as you'll be useful. Those fellows of mine have got some whimsy in their heads that it might be worth their while to take Miss Mannering out of my care. We heard them talking last night, and whilst I don't pretend to know what their game is, I gather that it has to do with something that was told them by that Russian whom you mauled so badly.' He broke off, and his keen dark eyes searched Carwyke's haggard face. 'The Slav didn't tell you anything, I suppose?'

Carwyke shook his head. 'No; he wanted to get hold of Miss Maunering, and attacked us. Nearly choked me out of life, and that half-breed woman stuck a knife in Billy.'

'That's the man who was with you, I suppose? Where is he?'

'Looking for Miss Maunering back along in the woods where you found me.'

'That so?' Standifer laughed. 'Then he'll search for some time! But you've gathered what the position is. There may be trouble with that pair of beauties whom you can see coming down the hillside there. The question is, Will you join forces with me?'

'Against the girl? No!'

'For the girl, fool!' snapped Standifer. 'You don't want her to fall into the hands of those brutes, do you? I assure you there is real danger of that.'

Carwyke's half-numbed brain reviewed the situation slowly, whilst the other watched him keenly, as if striving to read his thoughts. Standifer's word carried no assurance of the truth, but his offer did. There must be something in what he said, some powerful motive to induce him to offer terms to one whom he knew would seek to defeat his object, and the conversation to which he had listened was scarcely one to be improvised in a moment of surprise. Further, it would be a great advantage to be near Norma, for this would place him in a position to act on her behalf, not merely against the villainous pair who were now approaching the camp, but against Standifer himself. There was something in Norma's attitude which he could not understand, and which—

'Quick, Carwyke! Those fellows will be here in a jiffy. Will you stand in with us?'

'For the present, yes! But I reserve my freedom of—'

Standifer laughed harshly. 'You can reserve what you like, Carwyke. The girl is reserved for me. Better get to the fire. I'll find you some dry clothing in a minute or two, after I've explained your presence to that brace of scoundrels.'

He marched off to meet the pair now coming between the willows carrying a canoe between them. Carwyke himself moved stumbingly towards the fire, his eyes on Norma, who resolutely kept her face averted. He watched her wonderingly. That in the moment of his emergence from the willows she had been glad to see him he was convinced, and her present attitude disturbed him. She studiously ignored his presence, which was to him inexplicable, unless it was an attitude assumed to mislead her captors. At that moment the girl turned, and a second later as her eyes met his all doubts as to her attitude being an assumed one were dispelled, for the blue eyes were contemptuous. That she no longer trusted him that glance made clear, and he was wondering what lying tale

Standifer had told her, when Mardock's voice broke in on his thoughts. 'Did you really come over the falls, Carwyke?'

'Yes,' he answered shortly.

A thoughtful look came on Mardock's thin face. 'If I were a superstitious man——' he began, and then interrupted himself. 'You don't trust Standifer, of course?'

'Would you, if you were in my shoes?'

'No! But it's true what he says about Bull and the other scoundrel. It was I who overheard them talking.' He was silent for a moment, his eyes fixed on Norma, who was staring absently at the river. 'I'm sorry for that girl, Carwyke,' he said, with a swift glance round towards Standifer. 'I'd do a goodish bit to help her, and I'm glad you've joined forces with us.'

'Um!' Carwyke looked at the mosquito-bitten face in undisguised hostility.

Mardock laughed a little bitterly. 'Naturally you don't trust me any more than you trust Kit Standifer. I can't blame you for that. But it might be worth your while to think that I am disposed to be friendly with you. Kit's methods are a little too crude for me.'

Still the man whom he addressed made no response, and whilst the two stood silent Standifer and the other men advanced into the camp. Bull's repulsive face wrinkled in a grin as he moved towards the fire.

'Glad ter see yo' back again, Mister Carwyke,' he said with loud geniality. 'I guess that now we've got the girl it's all O.K., and yo' won't be quittin' us again.'

As the man spoke, Carwyke saw Norma turn half-way round and flash a look of indignation at himself. Standifer caught the look also, and a laugh broke from him; then he interposed. 'Bring the bags, Bull. Carwyke took a plunge over the falls up there, and needs dry clothing. Slippery now.'

'Ay, ay, Mr Standifer,' said Bull, and walked with careless slowness to his cross-eyed companion, who was busy with the canoe.

Standifer watched the man with gleaming eyes; and as Bull reached the canoe and said something to the other man, who broke into a laugh, a frown of wrath came on the watcher's dark face. Looking first at the two men and then at their employer, Carwyke realised that in one thing at any rate Standifer had not lied. The unprepossessing pair were openly mutinous. Three or four minutes passed without any move on the part of the man Bull, and then Standifer cried sharply, 'Those bags, Bull! Do you want Carwyke to get pneumonia?'

'Don't care a cent if he do!' growled the man in return; but nevertheless he brought the bags and flung them at Standifer's feet.

The frown deepened on Standifer's face, and his dark eyes flamed. He looked as if he were

about to spring upon the man, but visibly checked himself, and with a grin on his battered face Bull went back to his friend. Carwyke was amazed. Standifer was scarcely the man to suffer such flouting by an employee without some urgent reason for doing so, and he was still wondering what the explanation was when Mardock offered it in a whisper.

'Those beggars have cornered the ammunition! We're fairly in their hands.'

Carwyke whistled softly to himself. The situation was indeed serious if the two scoundrels were to break out and attempt to follow the scheme at which Standifer had hinted. After speaking Mardock moved away, and Roy Carwyke looked at Norma, still standing by the river, a most pensive figure. He wondered what she was thinking about himself, and if she knew that she was a cause of mutinous dissension between Standifer and his subordinates. Then he glanced at Standifer himself, who was stooping over the bags which Bull had thrown at his feet, and as Carwyke thought of his imperious nature, held in check by a pair of dull scoundrels with less than a tithe of his brains, but for the seriousness of the situation he could have laughed aloud. He wondered what the Russian had told that precious pair to so set them in opposition to Standifer. Had he offered them big money to take the girl back to Little Novgorod; or had he let something slip of which the pair had been unaware, and which had changed their whole outlook on the enterprise in which they were engaged, and which was moving them to get possession of Norma for themselves? Either alternative was possible, and which was the more probable he could not decide; but his heart went out to the girl, who stood in such solitude of spirit in this camp in which, as it must appear to her, every man's hand was against her. Impulsively he took a step from the fire with the intention of speaking to her; but at that moment Standifer intervened.

'Here is some clothing, Carwyke. The willows will make a dressing-room for you.'

He checked the impulse which would have taken him to Norma's side, and gathering up the clothing offered, walked to the screening willows, where he rapidly changed his wet clothes. But when that was done he did not hurry to return to the camp, where the cross-eyed one was already engaged in cooking a meal. Since the moment when, lying on the pine-needles, he had heard the shout, events had developed so rapidly that he needed time to assimilate the present situation; and he took it, whilst from the screen of the willows he watched the four men in camp.

Mardock had seated himself on the fallen tree a little away from the fire and was smoking, whilst with an enigmatic smile upon his face he watched Standifer. The latter was now by

the girl's side, evidently urging something upon her, Norma keeping her face averted and her eyes fixed on the hurrying water. Once Standifer stretched a hand and rested it on the girl's arm. It was instantly thrown off with a gesture that could have left the man in no doubt of the fact that such attentions from him were unwelcome. Carwyke rejoiced at the incident, which proved to him that whatever change had taken place in Norma's attitude to himself, her hostility to Standifer had suffered no softening. The latter, rebuffed, still continued to talk to the girl, receiving, so far as the watcher could observe, no answer at all. A moment later Carwyke's attention was diverted by a movement on the part of the cross-eyed man, who left the fire and approached his companion by the canoe.

'Watcher think of the job, Bull?' asked Tick in a hoarse whisper, which easily carried to Carwyke in the screening willows.

'Same as before,' answered Bull, who was plainly the master-mind in the partnership. 'This Carwyke pup ain't going ter make no difference.'

'But there's three of 'em——'

'An' we hold the guns an' shells, which is trumps an' aces together.'

'I ain't so easy in my mind as I was,' confessed his companion. 'It's one more to get rid of.'

'Oh, thet!' Bull spat to show his contempt. 'Ye make me tired, Tick! It's as easy ter get rid of three as of two.'

'But how?' persisted the other.

'Easy as wiukin'. To-morrow or whenever we starts this girl travels with us; an' when it suits us we leave Standifer an' thet fool Mardock to get their own way—that is, we make 'em go some way different to ourn.'

'But when's it goin' ter suit us?'

'When we know jest where this blamed river runs ter. I ain't going ter do no Robinson Crusoeing up here, an' when winter comes get froze ter a blasted icicle.'

'We'll have ter watch Standifer pretty close,' said the cross-eyed one. 'He's quiet now—too quiet ter my thinkin'; an' when he breaks out he'll be like forked lightnin'.'

'Well,' laughed Bull, 'he ain't goin' ter break out yet awhile. He won't call our hand till he can't help; an' by that time I reckon we'll ha' got the lie of this blame wilderness, an' know where we're goin' to. Don't ye worry, Tick. Trust yo'r ole pal; an' hop along an' get the gentlemen's supper as perlite as ye knows how.'

The cross-eyed man moved back to the fire, and Bull himself lit a pipe, and ostentatiously seated himself on a wind-fall, the whilst he considered Standifer with eyes that had in them a glint of amusement.

To Carwyke it was plain that the man though

he held his employer in the hollow of his hand. He watched the scoundrel for a moment or two, then, picking up his wet clothes, he moved quietly away, emerging from the willows at some distance from the spot where he had been standing. Standifer had given up his attempt to talk with Norma, and was seated by Mardock, whilst now Norma had moved a little way up-river nearer the willows. As he emerged the girl glanced at him once, and then turned aside; but, following a sudden impulse, Carwyke walked straight up to her. 'Miss Norma,' he said, 'are you not going to speak to me?'

'Yes, Judas!' she answered in a quivering voice. 'What have you done with Billy?'

His haggard face flushed at the greeting, and though his first impulse was to protest, he checked it, and quietly answered her question. 'I hope Billy is following us. I left him in the woods, looking for you at the point where the river forks.'

'You deserted him, you mean?'

'No,' he answered patiently. 'I left a note telling him that I had seen you in Standifer's hands, and that I was following you to keep in touch with you.'

'To join up with Standifer again, you should say.'

'No! You are mistaken. I have never been in league with Standifer.'

'That is not the truth!' replied the girl heatedly. 'You arranged with him to enter our camp at Unapik, and to persuade me to leave. You were to wait for him at some point, but did not do so, having, I suppose, evolved some wicked scheme of your own, as that man says.'

Her golden head inclined slightly in the direction of Standifer, and had it not been for the anguish in her face and the distrust in her eyes, Carwyke would have laughed aloud. The story which Standifer had used to discredit him in her estimation was so simple, but a moment's reflection told him that in its very simplicity lay its strength. All the circumstances, as the girl knew them, might be so interpreted; and once the possibility was accepted, gave to Standifer's lie the aspect of truth. He looked at the girl without reproach for her want of trust, understanding that in the situation in which she found herself it was easy for her to conceive that she had been betrayed, and for the moment he made no serious attempt to undermine her conviction. 'So that is the story!' he said lightly. 'Well, I hope that time and my service may discredit it, Miss Norma, and that I shall yet be able to prove my loyalty.'

'Loyalty?' she cried.

'Yes, loyalty!'

'It will require more proof than you can give,' answered the girl, with a quiet decision which proved how deep was her conviction of his treachery.

'I hope not,' he answered quietly. 'And I shall prove it even if I die in doing so.'

The girl made no reply. Turning away from him, she took a few steps along the bank as if to signify that she had no wish to discuss the matter further; and Carwyke, looking round, found Standifer regarding him with smiling maliciousness. A heat of anger surged in him, and it was only with difficulty that he refrained from walking across to the villain and striking him in the face. But prudence told him that there was nothing to be gained by such a course at this juncture, and, repressing his anger, he carried his clothes to the fire and arranged them where the heat would dry them. Then, with his temper in rein, he walked towards Standifer and his friend. The former laughed as he drew near. 'We were just discussing the signs of the weather, Carwyke,' he said, with an upward glance. 'It appears to be "set fair," don't you think?'

Carwyke knew that Standifer had been observing his interview with Norma closely, and easily guessed that the words were intended for a gibe; but he did not allow them to move him out of the composure he had reached.

'Then you don't know Alaska very well, Standifer, if that is your opinion,' he answered easily. 'Up here the weather is given to sudden storms.'

'That so?' laughed the other. 'Well, I'm no expert. Sit down and let us talk over things.'

(Continued on page 228.)

JEAN.

O THE sun is blinkin' bonnie on the scaur o'
Avich Mohr,
And the wind is soughin' softly owre the lea;
The burn is purlin' briskly as it lickers down the
glen,
And the yorlin's singin' blithely on the auld
rodden tree.
But tho' the world's sae bonnie, and it's braw wi'
simmer's pride,
I canna bide its beauty, for ma hert fair stounds
wi' pain;
I canna thole the thrillin' o' the lavrock's triumph
sang,
For ma ain dear Jean's been ta'en awa', and
now I'm a' ma lane.

O mony and mony a year has gane since first she
gripped ma hert,
But I've ne'er forgot the love-glint o' that day,
Sin syne for me her lovin' care has lichtened
mony a load;
Sin syne for me her cheery sang has shortened
mony a brae.
And noo I'll need to trauchle down the dark,
dreich road mase!,
Nae mair on earth I'll see her face—tho' see it
I wad fain;
But I'll lippen to His guidness Wha gied me sic
a boon,
That He'll tak me hame to see her, and I'll
walk nae mair ma lane.

D. C. T. MEKIE.

Chambers's Journal

SEVENTH SERIES

A HAUNT OF PEACE: LICHTENSTEIN.

By 'SNAFFLE,' Author of *The Image of War*, &c.

I.

IT seems strange in these days to come across a state—in Central Europe, too, where even Switzerland has unveiled (at Zürich) a monument to commemorate the toils and sufferings of its army—which passed entirely unscathed through the late war, and was even considerably enriched thereby. Such a country, however, is the Duchy of Lichtenstein.* Politically also it has, to a certain extent, gained, for although always quite independent, it was subjected to the Austrian customs and postal control, if only by treaties to which it was a party itself. Now it stands absolutely free from any tie, except that it has made certain arrangements, for mutual convenience, with the Swiss postal authorities.

I cannot say with absolute certainty that Lichtenstein is the smallest state in Europe, not having the figures relating to San Marino at hand; but it is certainly the smallest sovereign state, San Marino and Andorra being republics, and Monaco being, in foreign affairs at any rate, under French control.

Be this as it may, Lichtenstein can assuredly contest the palm for beauty, relatively to area, with any country in Europe. Roughly, it may be said to consist of a chain of mountains and a level plain—no doubt at one time a lake-bed—extending to the Rhine, which forms its western frontier. This plain nowhere exceeds two miles in width and shrinks at Vaduz to an eighth of this extent. So the bulk of the country can be called mountainous, the hills running always steeply, often precipitously, down to the Rhine level. Behind this first chain lies a smaller valley, that of the Samina, which stream runs north and down into Austrian territory, and joins the Ill. The range of hills forming the eastern side of this valley marks the other frontier.

It will therefore be readily understood that a large proportion of the country is not very profitable to its inhabitants. It is true that the limestone peaks are fringed with noble forests, and that the mountain slopes form

excellent summer pastures for stock; but there is obviously a large extent of ground which serves no useful purpose—except, indeed, to mountaineers and sportsmen. When we consider that the total area of the country amounts only to 38,900 acres, it is clear that not much is left for agriculture; and it is also plain that the maintenance of some 6000 cattle, with other stock in proportion (except sheep, of which there are only a few), involves hard and incessant labour on the part of the natives.

II.

The Sovereign Duke of Lichtenstein, John II., is one of the most interesting figures in Europe, if only in that he bids fair to break all records for length of reign, which, in his case, will have lasted sixty-seven years in November. Nor is it unnatural to contrast his personal territorial possessions with the area of his kingdom. They are more than ten times as great.

Before the war they were, with the exception of a couple of estates in Prussia and Saxony, all within the Austrian Empire, but now he finds himself a landowner in Hungary, Czechoslovakia, and Poland as well.

In another respect he also holds a record as a sovereign, for not only does he derive no income from his state, but is a most munificent contributor to all its needs. The fine Government building at Vaduz, the handsome new churches in several places, the elaborate works which have been constructed to prevent the disastrous inundations formerly frequently arising from the flooded Rhine, even the tourist paths over the mountains, owe their existence to his liberality. This is only to quote a few instances thereof, for it has been well said that no worthy object in the duchy has ever appealed in vain to the head of the state.

Nevertheless, it is a fact, though it may be believed with difficulty, that on the fall of the Austrian Empire there was a republican movement in this little country too, which was only suppressed by the determined attitude of the men of the *Unterland* (of which more hereafter). The force of ingratitude can hardly be carried further. It is true the duke may be called an absentee ruler, his visits to his kingdom being few and far between. Allowances must be made

* I follow the English spelling throughout. Locally the name is spelt *Liechtenstein*.

for the far greater importance of his other interests (the Lichtenstein Gallery and Library are familiar to most visitors to Vienna), his love for his palace of Eisgrub, and his racial eyrie of Lichtenstein itself, and the enormous labour involved in the superintendence of his great estates, works, and, not least, large real estate in Vienna itself. In his younger days the duke was an ardent sportsman; and this taste he had better opportunities of satisfying in his vast Austrian woodlands than in his own state. Moreover, there is no residence (to use the word in its continental sense) in the duchy. The old castle of Vaduz is a museum, restored and equipped by the duke himself; and his only abode here is his shooting-box, which is obviously unfitted for more than flying visits. (I may here remark that this house served as a refuge to the ex-Empress of Austria on her expulsion from Switzerland.)

The duke's last visit to his state took place four or five years ago; and it is possible, considering his advanced age, that he may never see it again. Unfortunately he has no children, and it is a little difficult to forecast the future of the country when it loses him. His brother, and heir, is himself a septuagenarian now, and will probably renounce the succession, which would then devolve on his son. But what will then be the position of a great landowner in all these new states; and will it enable him to indulge in such a luxury as that of a private kingdom, if I may so style it? The severance of the ruling house from the little state after two centuries would be a misfortune, even though it commenced in no more romantic way than that of purchase.

To conclude my brief remarks on the politics of the place, so as to enable me to return to subjects more congenial to my pen, I will add that Lichtenstein is governed by a single chamber, five members being elected by the *Oberland*, or hill villages; seven by the *Unterland*, or those of the plain; and three nominated by the duke.

III.

The *Unterland* represents the old Barony of Schellenberg, which was purchased by the House of Lichtenstein in 1699, thirteen years before the county of Vaduz was acquired by them. These two form the present state.

The parliament, however, does not often have matters of international importance before it. It was certainly an act of very great wisdom on its part to break away from the Austrian connection and its monetary system when it did, and to adopt the Swiss franc. But when the present Government proposed to go further, and join in a customs union with Switzerland, popular objection broke out, and the project is, at the worst, shelved for the present. Certainly

it is difficult to see what Lichtenstein could gain by such a change.

In this connection it is amusing to note that the Government were taunted with being 'foreigners,' the reason being that the leading spirits came from Triesenberg (in the *Oberland*). Now this district was undeniably settled in the beginning of the fourteenth century by the *Walliser*, who probably came from the Furka Pass district, rather than from Italy, as their name would import. It was, however, somewhat of an old story to rake up against them, though they are said to retain certain peculiarities of dialect and various customs. As the *Walliser* were Celts, we have here another instance of the political adaptability of the race, which at the same time furnished prime ministers to Britain, France, and—Lichtenstein! Only the name does not obtain here.

Lichtenstein is an intensely religious country, and all education is in the hands of the clergy. In this matter alone the state is not self-contained, the Church being under the headship of a Swiss bishop.

It may be called a country of one class—the peasant proprietor. Those of its citizens who take a more *bourgeois* position are those whose parents have provided them with the means of obtaining higher education, generally in Austria, and acquiring the title of Doctor, either in medicine, law, or philosophy. This is practically the only title known in the country. The army ceased to exist after the war of 1866, during which it served on the Italian frontier. The duke then disbanded it, and abolished military service. There is now no armed force of any kind—in fact, I had been over a month in the country before I saw a policeman. I imagine these men have rarely anything to do except to examine passports at the frontier, but their bright blue shakos are calculated to strike terror into the heart of any evil-doer, even though the effect is somewhat mitigated by the rest of their costume—a suit of 'dittoes.'

Is there any other country where life is so simple and patriarchal? The affairs of the great world are unheeded; the crops and the weather are the only subjects of interest. Poverty does not exist; still less so unemployment. Generally speaking, most of the people made money by the Great War, when, amongst other things, the novelty of sheep in large numbers was introduced to the duchy, these being found to produce a ready profit by their sale to Austria. As a proof of prosperity may be noted the new houses, built or building, to be seen everywhere. There are said to be 800 of these—in a country of twelve to thirteen thousand inhabitants, an obvious exaggeration.

IV.

Let us take a look at the country, arriving, as one naturally does, at Schaan, the only rail-

way station of any importance. We are here on the border of the *Ober* and *Unter-land*. The latter lies to the north, a great fen formerly, but now mostly reclaimed to pasture or arable. At the farther side of this rise the low hills of Schellenberg, crowned with the ruins of two old castles. There is not much to detain one in this district, though there are some pretty walks through the orchards and vineyards, and still more attractive ones through the fine woods on the lower slopes of the mountains.

Taking the main road through the duchy—and, except after fine weather, it will be dirty, I warrant you—less than an hour's walk brings us to the capital, Vaduz, nestling under the wall of rock which is crowned by its ancient castle. Vaduz is but a village—nevertheless it contains some handsome buildings and pretty villas.

The hill-road bears to the left here, passing the castle and shooting-box of the duke, and entering a fine forest. The traveller must be prepared for a 'stey bræ' now, whether he confront it, as most people do here, relying on his own legs, with the *rucksack* on his back, or whether he elect to invest a sovereign in the hire of a carriage and a pair of strong horses, which will take him up very little more rapidly, for the gradient throughout is too steep to allow of trotting.

An hour and a half brings one to the open country in the pretty orchards and pastures of Rotenboden. From here a multiplicity of routes is available, straight on to the picturesque district of Triesenberg and the range of mountains which forms the southern frontier, upwards on the road which crosses into the Samina Valley by a tunnel, or more left-handed to the dominating group of the Three Sisters, and the fine mountain path constructed by the ruler of the country, and known as the 'Duke's Road.' In each case one goes through a succession of Alp meadows, closely mown in summer and continuously thereafter, giving the effect of a walk in a vast park, as these grassy slopes are everywhere studded with fine trees.

The visitor need not fear being stranded for the night, for he is within a short walk of several *Kurhaiser*—practically hotel-pensions—of greater or less pretensions, at one of which a stay of some length may prove delightful in a good summer, and will be found decidedly inexpensive, as, indeed, life is everywhere in the duchy. Of these, far the largest is that of Gaflei, which can accommodate a hundred visitors, and is some 4900 feet above sea-level.

The Duke's Road practically starts there, and winds up to the limestone peaks. It is perfectly safe, though it passes some sensational points—to inexperienced Alpinists—and skirting the highest points of the range, it eventually descends to Feldkirch in the Vorarlberg—that is, for those whose passports bear the Austrian

visa. During the walk chamois are often to be seen from the path—in fact, I have seen them within a furlong of the *Kurhaus*.

Animal life is, however, not much in evidence, at any rate at this season of the year. The place is too disturbed for that.

Peasants are continually mowing (I had almost written shaving) their Alp meadows; the grazing cattle are attended by shouting children; and the local tourist is unable to walk far without expressing his delight in the beauties of nature by blood-curdling war-whoops. So it is no wonder that the deer, both red and roe, are found farther down at this season. A few years ago the duchy was rather rich in the larger game. The Austrian foresters (always fairly correct in such matters) estimated the head of red deer at a hundred, and that of chamois at four times that number. Now there are a good many less. I am told 'there was much poaching during the War'; but the reason for this seems obscure. At all events, the casual visitor is not very likely to see any four-footed animals other than the above-mentioned chamois and the black squirrels, unless it be a roe about sunset.

Bird life is also not much in evidence. Eagles breed in the duchy, and are not infrequently to be seen soaring above the hills. Except these, hawks, ravens, and crows, and the commoner woodland birds, such as woodpeckers and jays, even a trained observer will not note much, though these hills hold no fewer than four varieties of grouse (capercailzie, black game, hazel grouse, and ptarmigan), and one of partridge—the stone-hen (*Caccabis saxatilis*). I hasten to add that there is no free shooting in the duchy; it is all let.

v.

Space, unfortunately, compels me to leave much of interest in the duchy unmentioned. Indeed, I feel I have hardly been able to bring its charms home to the reader, whom I can assure that a visit thither will not be regretted. It is true he will not find the palatial hotels of Switzerland, its English chaplains, or its golf courses. But if he can put up with simple fare and unpretentious hostelries for the sake of great natural beauties, delightful rambles, and even Alpine ascents suited to moderate ambitions, and, above all, a climate of exceeding healthiness, he will not fail to find all of these.

If proof were wanting, it will be found in the fact that, before the War, the Germans had 'discovered' Lichtenstein. They packed its hotels and pensions, and they even built villas in some of its beauty spots. Now the state of the mark has compelled them to abandon a country with a gold currency, and the way—not long, barely twenty-four hours from London—is open to a new invasion, like all things here, a peaceful one.

A GIPSY OF THE NORTH.

CHAPTER XI.—*continued.*

WELL knowing that to do so would confirm Norma in her opinion of him, Carwyke accepted Standifer's invitation. It was necessary, he thought, for the present to maintain an outward show of falling in with the scoundrel's plans, so that, when opportunity arose, he might carry Norma outside the scope of them; and, seated on the log, he looked at Standifer expectantly.

'We're in a mess, as you know, Carwyke,' said Standifer with lowered voice. 'The question is, How are we to get out of it? These rascals have the ammunition, as Mardock has explained; and the only weapons we have are an empty rifle and an axe.'

'Can't you rush them?' asked Carwyke.

'No! They have our pistols—and Bull is a dead shot.'

'How did they get them?'

'Oh, we'd discarded our belts for comfort during one of the halts, suspecting nothing, and Bull quietly transferred them to the other canoe. It wasn't until Mardock had heard them discussing their plan to seize the girl that we discovered the loss.'

'But why should they want to get Norma away from you?' asked Carwyke, giving no indication of what he had so recently learned.

'Better ask Bull!' said Standifer with a short laugh. 'Jim here overheard him refer to something that the Russian said about the girl, but exactly what the game is we don't know.'

'What can the Russian know about Miss Mannering?' inquired Roy, moved by something more than curiosity.

Standifer shrugged his shoulders. 'Search me,' he said. 'I'd give a thousand dollars to know. What happened before you beat the fellow up? Did he get the girl's name?'

'Yes,' replied Carwyke, 'and it appeared to excite him.'

'It would—if he knew,' commented Standifer absently; and then, suddenly realising that he had let slip something that he had not intended, looked sharply at Carwyke.

The latter gave no sign of having marked the other's implied admission of secret knowledge, and continued his account carelessly.

'Fellow attacked us as suddenly as a thunderbolt out of a clear sky. It was the toughest rough-and-tumble I was ever in, and my throat is sore now from the throttling he gave it.'

'You laid him out, though. He won't be fit for much for a month, which is maybe a good thing. I've no hankering to be trailed across Alaska by Goliath.'

'Do you reckon we're going to get across Alaska, Kit?' asked Mardock quietly.

'Yes! And take the girl with us.'

'But how are you going to get away from Bull and that cross-eyed partner of his? His programme isn't yours, remember.'

'I've been thinking over things,' said Standifer slowly. 'We've got to take some risks, and I propose that when the camp is quiet to-night we cut away with the canoes.'

'If it were dark, that might be possible,' replied Mardock quietly. 'But it is light at midnight, and Bull's shooting is classy, as you know.'

'That's true, but we must watch for the opportunity. If they should both sleep—'

'They won't!' said Mardock with conviction.

'Well, there's another way. This country is full of rivers and lakes. If we can get Bull in front we may be able to turn up some creek—'

'Thank you, no, Standifer. I'm not going to wander off into this wilderness without ammunition. I've starved once, and I'd rather have a bullet from Bull than do it again. That scheme's off!'

Standifer frowned a little at this opposition to his will, then laughed. 'There's one thing you've forgotten, Mardock.'

'What's that?'

'It can't be very far to the Russian mission which the trader up at Novgorod spoke of; and once there—' He broke off and laughed again. Mardock's face grew suddenly tense.

'You mean to go right through with it, Kit?'

'Yes! You didn't think I was weakening, did you?'

Mardock made no reply; but with half-shut eyes stared at the river, whilst Standifer addressed himself to Carwyke.

'You're thinking we are in a tight corner, Carwyke; but things aren't quite so bad as they look. Somewhere down this river there's a mission-station—Russian. If we can reach it before those blackguards shoot us, their game, whatever it is, is blocked. If the worst comes to the worst, we can make a run for it to-morrow.'

'You'll run without the girl then!' said Carwyke, and explained what he had overheard of Bull's plans for the morrow.

Standifer whistled. 'That means we're under sentence! We shall have to keep watch to-night. Those rascals may shoot us while we sleep.'

'I don't think so,' replied Carwyke. 'Bull doesn't know the country, and I gather he has no intention of being lost in the wilderness. Till he gets a notion where the river leads, you are safe enough.'

Standifer gave a sudden laugh. 'Then we're still insurable lives; for I haven't a notion where it leads myself. I guess we'll sleep sound to-night after all.'

But the guess, as it chanced, was a mistaken one, for when five of the party were asleep, the stillness of the rosy midnight was shattered by the sound of rifle-fire close to the camp; and rolling over and sitting up, Carwyke saw Bull behind a tree, rifle in hand, staring across the willows.

'What is it?' asked Standifer.

'That d——d Russian with a gun, I guess. He shot——'

Somewhere among the pines on the hillside a rifle cracked again, and the cross-eyed Tick gave a yell and dropped the rifle he was carrying. In a second Standifer leaped for it; but, quick as he was, Bull was quicker. Disregarding the marksman in the pines, he covered Standifer.

'Get away from that gun!'

Standifer hesitated, but in a savage voice Bull cried, 'Get away or——'

Standifer got away; and Tick picked up the rifle and dodged towards the trees, as again the rifle in the pine-wood spoke.

'Get the canoes out,' roared Bull. 'Keep back in the trees, girl, if ye don't want ter be plugged.'

He sighted for the thick of the trees a moment

later and fired—evidently without result, for a second later a bullet plugged the tree behind which he sheltered.

'Durn the Russian!' he growled, and then addressed himself to his companion. 'Keep yer eye on 'em, Tick. Don't let 'em slip off with the girl.'

And Tick, with a forearm that dripped blood, did it faithfully. The chagrin in Standifer's face showed that Bull's foresight had balked him of a chance, and as the canoes slipped into the current, with Norma between the two ruffians and Carwyke with Mardock and Standifer in the leading canoe, the last-mentioned cursed audibly to himself. Then, as they came into the shelter of trees, he turned his head sharply.

'Do you think it was the Russian?' he asked.

'Who else could it be?'

'I was thinking of that squaw-man who——'

Carwyke laughed sceptically as he answered, 'The Russian, more like.'

But in his heart he was sure that it was Eskimo Billy who had found them, and rejoiced to think that at all costs he would follow them, across all Alaska if need be.

(Continued on page 246.)

THE CHAPEL WITHIN THE TOWER.

PART II.

VI.

IN the Jewel House are kept a very handsome gold altar dish and flagon. On the former, in high relief, is a presentment of the Last Supper, whilst both bear the cypher of William and Mary, King and Queen of England, 1689–1694. These pieces of ecclesiastical plate, three times in each year, take the place, by order, on the altar of the chapel of St Peter ad Vincula of a much older and perfectly plain gold set, dating from Charles I. The three occasions are Easter Sunday, Whitsunday, and Christmas Day. The origin of this order was probably purely political. It was intended thus delicately to indicate that the Stuarts were no more, and that a new dynasty had arisen. Though the reason for this tri-annual displacement has long since disappeared, the tradition is adhered to, so that to this day, on three Sundays in the year, William and Mary's altar plate is substituted for that of the Stuarts.

It may often have been a source of wonder to visitors that historic families, whose ancestors were great and commanding personalities, holding the highest offices in the state, who met their fate in the Tower, and are buried in the chapel, are but slenderly commemorated. The dukes of Norfolk, Suffolk, Northumberland, Somerset, and Monmouth might well be more prominently connected with the ancient chapel in which

they lie at rest. There lie also beneath the stones many others who were lesser than dukes, but who are of considerable historical standing.

It would be out of place, these centuries later, to branch forth into massive memorials or monuments, but a simple and effective means of commemoration seems open to all. Round the chapel are great clear-light windows, almost challenging in their severe simplicity. It would appreciably add to the interest of the chapel, as well as produce a delicate decorative effect, if small escutcheons in stained glass were placed in each of the lights, simply portraying the armorial bearings of the great families whose connection with the Tower is so intimate. A very small effort would suffice to raise the moderate sum required to put this suggestion into effect, and this might be done in a very simple way. Thousands of visitors pass through the chapel in the course of the year, and might be glad to drop a small silver piece into a box to provide the sum required to instal these historic memorials.

The magnificent Blount memorial is a signal example of the great advisability of putting up a highly decorative and expensive memorial to oneself, however modest may have been one's claims to distinction, in the assurance that it will last for ever, or at any rate for many centuries. The Blounts, Sir Richard and Sir Michael, father and son, were quite moderate persons, and both

in turn were Lieutenants of the Tower, as have been scores of excellent officers before and since. But they, unlike less ambitious lieutenants, spent very large sums of money on the marble and alabaster monument erected to their memory. In Westminster Abbey such a monument might be lost to view and notice amongst hundreds of others, but in the isolated seclusion of St Peter's ad Vincula it is, and has been for centuries, practically alone in its glory. Queen Anne Boleyn, Queen Katherine Howard, the Duke of Monmouth lay beneath simple and unmarked stones for centuries, but the Blounts reigned above in alabaster and marble.

In truth, it is a very fine monument, with groups of almost life-size figures kneeling in prayer, these figures being those of the Blounts and their wives and sons and daughters. One of the ladies is shown with her cap-string thrown forward over her head, thus denoting that she was a widow; whilst another is carrying a skull, denoting that she also belonged to the same sad—or perhaps gay—category. In small, round niches in the face of the monument are two skulls, one presumably that of Sir Richard Blount, whilst the other is a plaster cast, possibly taking the place of the true skull of Sir Michael, purloined by some nefarious souvenir-seeker in bygone ages. This monument for long stood between two of the pillars in the body of the chapel, but now is affixed to the north wall of the chancel and close to the altar.

The sarcophagus which should contain the bones of Sir Richard and Lady Cholmondeley is the only serious rival to the Blount memorial. It represents a full-sized knight and his lady, carved in alabaster, lying at rest on what was intended to be the future encasement of their bones. This sarcophagus was erected by Sir Richard Cholmondeley in his lifetime, when Lieutenant of the Tower, about 1515. It originally stood in the centre of the nave in front of the altar, and no doubt Sir Richard, from his neighbouring pew, weekly regarded it with much interest during divine service. He was, however, never buried in it, for he did not die till 1544, long after his intimate connection with the Tower had ceased, and was buried at Cholmondeley, in Cheshire. Nor was his wife here buried, for she rests at Corsham, in Wiltshire.

That the knight and his lady were not lying beneath their effigies was discovered when the monument came to be moved from its first site to its present one. Inside were no human bones, but only a dismantled font, dating from Edward I. This gray stone font was put together again, and now stands just inside the chapel door, on the south side.

VII.

At the foot of the brass tablet, and a few feet from the west wall, is to be seen a stone

slab, on which is cut a barely distinguishable sign: two small circles, each about the size of a half-crown, one above the other, and above both a diamond-shaped device about the same size. Through the three runs an arrow. By tradition the stone thus marked covered the resting-place of the three lords who were executed for their part in the Scottish rebellion of 1745. The three lords were the Earl of Kilmarnock, Lord Balmerino, and Simon, Lord Lovat, the last three of the long list of those who have been executed on Tower Hill.

During the operations undertaken by the committee of 1876, it was decided to raise this stone and verify the tradition. Beneath it were found human bones, much intermingled, owing apparently to adjacent later burials. The coffins had crumbled away, but happily the coffin plates were in fairly good preservation and easily decipherable. These are now to be seen in a glass case attached to the west wall of the chapel. From left to right they read: *Willienus, Comes de Kilmarnock; decollatus 18 die Augusti 1746; ætatis suæ 42. Arthurus, Dominus de Balmerino; decollatus 18 die Augusti 1746; ætatis suæ 58. Simon, Dominus Fraser de Lovat; decollat. Apr. 9, 1747; ætat. suæ 80.* The bones of the three lords were reburied in the crypt, and the stone replaced in its original position. Owing to the passing of thousands of feet, the ancient marks on the stone have become very faint. It has therefore been decided to accentuate these, and to fill them in with lead, so that all danger of this record being obliterated may be removed.

Against the west wall of the chapel is to be seen a marble tablet to the memory of Colonel John Gurwood, C.B., K.T.S., 1845, a Deputy Lieutenant of the Tower. This tablet might escape notice but for the fact that, in the emblematic fashion of his day, a sword and a volume of the Wellington Despatches in marble form part of the memorial; but it was quite recently brought into notice by a curious occurrence. A party of people interested in spiritualism were using a planchette, which at the moment was in the hands of a Mrs R. Upside down to Mrs R. the planchette wrote: 'I am John Gurwood I killed myself in the Tower of London.'

Neither the monument itself nor the chapel register gives any hint that Colonel Gurwood died any but a natural death. On consulting, however, the *Annual Register* for 1846, which is in the Record Office, it was found that the planchette had spoken true. It appears that Colonel Gurwood, a most gallant soldier, had been severely wounded in the head during the Peninsular War, and that, being entrusted by the Duke of Wellington with the compiling of the Wellington Despatches, he so over-worked himself that his brain gave way, and

in a fit of temporary insanity he took his own life.

The roof of the chapel, which is of chestnut-wood, was put in by Henry VIII. (1509-1547). During its post-historic period, when the chapel became a most uninspiring example of a smug parish church, this fine roof was covered over with lath and plaster, as being presumably more decorous. The committee of 1876 happily swept this monstrosity away, and the old beams now again stand revealed, in perfect preservation.

VIII.

Outside the chapel, and close to the south-west corner, may be seen, let into the pavement, a large slate-gray stone which has a curious record. In 1743 Lord Semphill's Highlanders, now known as the 1st Battalion Black Watch, were ordered down from Scotland, with a view to being sent to take part in the campaign in Flanders. The Highlanders had never been out of Scotland before, and when they arrived in London, much to the terror of the Londoners, who spread fearful stories about these bare-legged and ferocious warriors, the story got put about in the regiment that their destination was not Flanders, but the West India Islands, then a penal station.

One hundred of the Highlanders therefore decided to leave the colours and to march back to Scotland. When this desertion was reported, cavalry were sent after the fugitives, and, rounding them up near Northampton, marched them back to London. Here they were tried by court-martial, and three of the ringleaders were sentenced to death. These three were

two corporals M'Pherson, and piper Shaw. They were placed with their backs against the chapel wall, and there shot by a party of the Guards, whilst their comrades were paraded to see the execution. These three men are buried under the plain gray stone.

Three times a year—on Easter Sunday, on Whitsunday, and on Christmas Day—the yeoman warders parade in the uniform they have worn since the days of Henry VIII., and, armed with their halberds, march into the chapel, making a curious and historic contrast with the modern uniform of the Guards. On these three Sundays, as before mentioned, is also to be seen on the altar the massive and very handsome gold plate bearing the cypher of William and Mary.

Few, perhaps, know that the chapel of St Peter ad Vincula is open to the public, without passes or tickets, every Sunday at the hour of morning service, which is 11 A.M. In connection with this service there is a quaint survival of ancient days. During service the great entrance-gate at the Byward Tower is closed, and a yeoman warder stands on guard over it. In days of old this gate was thus closed and guarded, and the portcullis dropped, so that the garrison should not be taken unawares whilst engaged in their devotions.

Though, naturally, no such danger now exists, the ancient custom still holds good. This morning service is the church parade of the garrison, and the battalion of Guards at the time stationed at the Tower attends it in full uniform.

THE END.

BRITISH WILD SWANS.

By A. R. HORWOOD, F.L.S.

I.

IT is a joy to the sportsman if he can bag our largest sporting bird, the swan, of any of the three types that are to be met with in this country. The chance of doing so is not to be secured just at any time, and it is the difficulty of getting near a herd that adds to the charm of this class of sport. Only now and then, and here and there, are swans to be heard or seen. Even then, to get within range is quite another matter. A combination of circumstances must arise, or be made, to secure success in this field.

It is not always easy at a distance to distinguish the different species, for all are white when mature, and the distinctive characters are not visible unless you have field-glasses at hand, or are within very close range. There are three swans, or four if the Polish Swan is considered distinct—but it is regarded as a variety of the Mute Swan. This swan, too, is seldom met with

in a wild state in this country, and many so-called wild swans of this type are merely domesticated birds that have escaped from their confinement.

The Whooper Swan is perhaps more usually met with in this country than the other species of wild swan. It is common at suitable times—that is, in severe weather—on the islands off the coast of Scotland. It is less numerous off the coasts of Ireland, where Bewick's Swan is more in evidence.

At certain times the size of the herds may amount to a hundred or even a thousand. On other parts of the coast Whoopers do not occur so generally or in such numbers. But off the Norfolk coast, and other parts of the east coast, the watchful sportsman or wild-fowler may observe flocks or herds of ten to twenty. Nor do they appear so abundantly off the south or west coasts. The Whooper occurs here and there off the Welsh coasts in some numbers. Inland,

herds are seen passing over, and they will settle in suitable districts in severe weather.

This is our largest swan, reaching a length of five feet, and an expanse of seven feet in the wings. Its normal weight is eighteen to twenty-four pounds. The chief means of distinguishing this swan is by the beak, which is black; at the base the skin is yellow, and part is depressed, not (as in the Mute Swan) raised. In the first year the cygnets are dull-fawn colour, in the second year white. The legs, toes, and feet are black. The Mute Swan has orange where the Whooper and Bewick's Swan have black on the bill.

The Whooper delays its arrival here until the weather is severe. For it is cold in the Far North that closes its haunts to it, and the search for food drives it southward. It usually arrives in November, and other herds wait till December. If the weather be mild, herds will even come later still. Though they normally remain till February, their departure is sometimes delayed till May, or even June. This happens in the case of those birds that come to inland haunts, and even take up their quarters with domesticated birds, such as Mute Swans.

There is hardly the gracefulness of carriage of the Mute Swan in the demeanour of either the Whooper or Bewick's Swan. Indeed, they carry the neck like wild geese, straight, and the head at right angles. Much of their food consists of water-weeds and water-snails and mussels. Swans are thus great pond-clearers, and it is therefore seldom that one finds them in company with other wild fowl on a prolonged visit to the same haunt.

One name for the Whooper is Whistling Swan. The note is really a trumpet-like note, as a rule 'hoop-hoop,' though it is no doubt variable. Its flight is powerful and fast; but owing to the expanse of wing and large size of the bird, it is deceptive. In a way it can be likened to that of the heron rather than that of the wild goose. The neck is held out straight in flight, and Whoopers fly in herds in wedge formation, like wild geese.

II.

Bewick's Swan comes to us from farther north than the Whooper. It is not so long or so big, being about four feet seven inches. It comes to the same parts of Scotland as the Whistling Swan, and Ireland is probably the best winter resort it has. Perhaps the surest means of distinguishing the Whooper and Bewick's Swan is the orange mark of the bill, which in the latter is rounded in front, and does not extend to the nostril. It is also noticeable that the black extends to the forehead in Bewick's Swan, so making two patches, and in the case of the Whooper it stops short.

Sometimes one may hear of Bewick's Swan reaching us in October, and rarely I have had

reports on the east coast of arrivals at the end of September. On the whole, however, it is seldom that herds are seen in any number or of any size till much later. Their more northerly breeding-haunts bring the earlier birds to our shores before the main body, which will linger in North Europe till the severe weather comes. These swans do not remain so late as the Whoopers, March usually marking their departure. This swan is sometimes to be seen on Irish loughs in very large numbers. As many as a thousand have been noted. The herds are large, and the species is somewhat more gregarious than other swans. It is more addicted to coastal resorts, though in severe weather it comes annually to Midland and other inland resorts. Once swans find a resort to their liking, they will come again. Indeed, were this not so, it would be far less easy to get some swan-shooting. That, however, owing to the recurrence of rough weather each season and the wandering of herds periodically, is rendered generally possible in most districts.

Most of those who have heard the note of Bewick's Swan have likened it to a sort of bark. It is a loud and sharp note, but musical, and it has also a note which is worthy of the name of song. The young of the Bewick's Swan reach maturity in two seasons, and are pure white. This species was first distinguished by Yarrell, and is named after Bewick, the naturalist and animal artist. Bewick's Swan is perhaps more fond of sea-wracks and marine molluscs and crustaceans. This is not so wily a swan as the Whooper; it is more readily approached. On the water it floats with a buoyancy which is natural in a much lighter species, for it weighs only half as much as the Whooper.

It should not be necessary to describe here the Mute Swan, which is so familiar a sight on many ornamental waters, as well as on rivers and canals, or even small ponds and streams, where they have been introduced. But some remarks on the species will be found below in connection with the swannery in Dorsetshire, and the various swan-marks.

III.

There are times and seasons when wild swans afford better sport than at others. Thus the best time is when they are just arriving on our shores, when the shore-shooter and punt-gunner can get some sport. Then, while they make their way across country, there are opportunities to be seized as they spend a short time on the way at a haunt they have frequented on a previous occasion. When they first arrive they are less wary, and one can get nearer them. This also is always the rule in severe weather. So seldom do swans appear in some districts that it is necessary to be on the *qui vive* when the occasion presents itself. To stalk them one may perhaps get better results in a

squall or when snow lies on the ground. It is not often that chances occur away from their main haunts in calm or mild weather. If the weather is not rough they pass overhead at a great speed, and high up; so they are out of range, their pace being as fast as that of mallard or widgeon, though it does not appear so on account of their great size.

To track or stalk a herd of swans it is necessary to practise much woodcraft or fieldcraft. They are not easy to approach when feeding on the open coast or on large inland pools. Advantage must be taken of every available bit of natural cover. In common practice the time for shooting them is flight time. Presenting so large a mark, swans can be shot with a rifle at long range, up to two hundred yards. It is rendered easier to know when swans are coming to a suitable resort, because their note is loud and resounding. If one is within reach of a herd on the coast there is usually enough cover to enable one to creep up, and there are excellent stands along the flat parts of the coast in the form of long sea walls, more or less at right angles to the beach. Inland, where a herd is of some size, the marginal vegetation will offer, as a rule, sufficient cover. It may be necessary, however, in the absence of this, to use a stalking-horse, or to requisition the creeping carriage. It is naturally easier to approach swans at night when punt-shooting.

Perhaps the most satisfactory means of shooting swans is at flight time. This is, of course, when they have been duly located and are known to have regular habits and times of flying. Then it is a question either of stalking them and getting within range, or, better, of lying in wait for them to come over on the lines of their flight. In doing so, it is advisable to take particular notice of the wind. When wild swans are disturbed they will often use the same route. This being observed, it is a good plan to post a second gun on this line and put the herd up from the same point again. It is useless approaching swans against the wind; for they rise against the wind, and go away from one.

Sometimes quite an easy shot with a 12-bore shoulder-gun can be had, and mould shot should be used. The parts to try to hit are the head and the neck. To score a hit the only plan is to aim well forward. The best chances come when birds are flying across one's vision. If a herd is unapproachable by stalking or flight-shooting, some advantage may accrue from driving, as with wild geese.

On the coast, so long as the right methods are adopted—and swans are amenable to this form of approaching them—good sport can be had in a punt. The swivel-gun used should be loaded with No. BBB shot. Swans rise slowly against the wind, and usually fly along the surface for a hundred yards or so before rising.

They have more difficulty in rising in calm weather, for it is by using the wind under their wings that they can rise and obtain the necessary leverage. It is possible in a sea-going fast punt to go in the direction of a herd and to get within easy reach of them, even so near as thirty or forty yards.

IV.

Sometimes a few Mute Swans will be found to have adopted a feral existence, flying to the coasts from their ordinary haunts. They may come from private waters, where a few are kept, but some, no doubt, come from the great swannery at Abbotsbury, which is on a large piece of water enclosed by the Chesil Beach. Here quite a thousand swans are kept. In former years there have been still more. The swannery is a very ancient one, having been in existence when the abbey of St Peter was still flourishing. The head of the fleet is a jungle of pampas and reeds, and there are several hundred nests a year scattered over an area of not more than two acres. To keep their place the swans do not leave the nest-site, and are given materials from the reed-stacks by the swanherd in order to build up the nest.

When the cygnets are fit to rear they are placed in feeding pens, and some are fattened for the table, the rest being kept to maintain the herd.

Formerly swans were regarded as royal, or the king's property, and it was illegal for others to keep swans unless they were freemen and had a grant to keep them. Such freemen, too, had to rent land bringing a rental of five marks. All swans had marks, and in Elizabeth's time there were 900 corporations or individuals who kept swans. The Crown and the Vintners' and Dyers' Companies have swans, which are marked on the first Monday in August. That of the Crown is five diamonds; the University of Oxford has an arrangement of crosses; that of Cambridge is three buckles; and that of the Vintners' Company is a double chevron. The theft of a swan in Henry VII.'s time was punished with a year's imprisonment, that of a royal swan far more severely.

Quite generally formerly young swans or cygnets formed a royal dish, as they do in a sense to-day. The king has a swanherd at Hampton Court, and thirty-six cygnets are fattened from the Thames supply. The Thames swans are owned by the king, and by the Vintners' and Dyers' Companies, being kept for a time in a wired-in enclosure on the Thames, and specially fed. Otherwise the swan is coarse in flavour. Presents are sent to other courts.

Formerly swan's-down was much in request for stuffing pillows, &c., and other purposes, but the decay of swanneries and the substitution of eider-down and other substances have rendered

swan's-down no longer so important an article of commerce as once.

Much harm may be done by keeping swans on a sheet of water where there are water-lilies or other aquatic plants which it is desired to

maintain. A pool where swans thrive is usually destitute of the food that wildfowl require, and wildfowl will not take up their abode there, save moor-hens and coots, which are much more stationary.

THE YELLOW STREAK.

CHAPTER III.

STANDING by the open French window, Leighton thought that never before had he seen so delightful a picture of English womanhood as that revealed by the flickering light of a log-fire burning cheerily on the hearth. For some days he had been staying at Walton's charming country residence, some thirty miles from London, and returning from a long, solitary tramp, he was about to enter the house by that very window, when the sight of a beautifully-dressed lady already in occupation brought him to a standstill. On the short grass of the well-kept lawn his approach had been noiseless, and he was thus able to admire the dainty tableau she made without her knowledge. Her identity he had already guessed; she was Norma Walton, the chairman's only daughter, who had been a slim, long-legged hoyden of fifteen when they had last met.

In moving away he attracted her attention, then hastened to apologise for having disturbed her: 'I am so sorry, Miss Walton; I was not aware that you had returned, otherwise I should not have blundered round here and disturbed you. As a matter of fact, I must confess that I was about to take a short cut to my room.'

'Why—it's Mr Leighton. How very nice of you to remember me all this time. It must be ages since we last met.'

'About nine or ten years, I believe.'

'What a dreadful long time. But do sit down. I am expecting father any minute. Yes, here he comes.'

'Bless my soul,' said Walton, returning his daughter's caresses fondly, 'where have you sprung from? I didn't expect you for weeks yet, so I invited Jasper up.'

'Well, surely there is no reason why Mr Leighton should be turned out because we have unexpectedly returned,' said a pleasant voice from the door, Mrs Walton having entered just in time to hear her husband's remark.

'Good-evening, Mr Leighton; I do hope you have not been dreadfully uncomfortable.'

'Not at all, Mrs Walton. I have spent a very pleasant time, I assure you.'

'Come on, Jasper,' interpolated Walton ruefully; 'dinner's in half-an-hour, and we've got to dress. No more free-and-easy bachelor dinners now, my boy!'

It was one of the most delightful meals that Leighton ever remembered. Never a ladies'

man, he considered himself at forty a confirmed misogynist; yet there was some latent power in the elusive charm and beauty of this new-old friend of his which completely fascinated him, and he found himself unconsciously admiring the long, fine lines of her graceful figure, and the full, rounded contour of her throat and bosom. Nor could he help responding to the flash of two of the bluest eyes he had ever seen, or noting with approving glance the two bewitching dimples which frequently appeared at the corners of her well-cut mouth.

Afterwards, in the drawing-room, the time sped quickly by in reminiscences of past travels, and Leighton felt a slight tinge of regret when Walton lit a cigar and commenced his usual business chat.

'About this El Chaco business, Jasper. Have you engaged a new superintendent yet?'

'Yes; and I believe that I have found out the one man in England who will be able to handle it. He is a first-class engineer, exceptionally clever, and, incidentally, is an old friend of mine.'

'H'm, sounds all right. Who is he?'

'His name is Hume—Kent Hume. We were at school together, but he was always well ahead of me. He is an "honours" man: Cambridge.'

At the sound of Hume's name Norma Walton looked up from the book of views she was glancing through, with an enigmatical expression on her face. Leighton thought she was about to question him, but with an effort she restrained herself.

'Hume! Hume!' mused Walton questioningly; 'seem to know the name somehow, but can't remember why just now. However, is he able to handle a very ticklish piece of business without making a hash of it? We need some new leases on that El Oro property; the old ones expire soon, and they are queerish people to deal with. I would go over myself, but our holidays commence next week; just a minute, I'll get the papers.'

Norma laid down her book as her father left the room, and with an air of feigned indifference asked, 'What is the name of your new superintendent, Mr Leighton?'

'Kent Hume,' he replied easily. 'Is the name familiar to you?'

'Yes, it is. I was—I once knew somebody

of that name a long time ago, in America. What is he like?

A glint of amusement flickered for a moment in Leighton's eyes. 'Now you have given me a task,' he said; 'I've known Kent for the last sixteen years or more, yet I doubt very much if I could describe him successfully.'

'But is he tall or short; dark or fair; bachelor or benedict?'

'Well, he is of medium height, about five feet five or six, slimly built, but for all his slinness he is extraordinarily strong. His face you might dub at first sight ordinary; but, after studying it for a moment, you would probably change your first impression. He has a broad open brow, topped by a mass of dark, curly hair, which no amount of brushing could straighten; two dark eyes—I could not tell you the colour to save my life—which ever look you straight in the face; and the finely-formed, sensitive mouth of the artist. Although he is graded as one of the finest engineers in the country, I know that his heart is not in the work, but when Kent goes in for a thing he goes the whole hog. Finally, he is unmarried, has sufficient means to enable him to follow his heart's desire, and is one of the truest friends and whitest men I have ever met.'

'Thank you, Mr Leighton,' said Norma, with a smile. 'Your description is quite unlike the person I used to know. However, your superintendent certainly possesses a firm champion in you.'

'Here they are,' broke in Walton, as he returned with the papers, and for half-an-hour the two men were buried in the maze of technicalities connected with the leasing of land in foreign countries.

'I say, daddy, have you decided where we are going for our holidays?' queried Norma later on, when the business was settled.

'Not yet, kitten. I had thought of Norway, tentatively, if mother is agreeable.'

'Suit yourself, dear,' replied Mrs Walton. 'I have no choice.'

'Not Norway, daddy,' objected Norma. 'Why, we were there only last year.'

'Well, where then? Paris—Venice—Naples—Rome?'

'No,' shaking her head playfully; 'none of these. We might go—I know. Suppose we go to South America.'

Walton shook an admonishing finger at his daughter. 'Now, kitten, what sort of a holiday do you expect to get in South America?'

'But you promised to take me round the line in your private car, and I have so longed to go. Besides,' she continued archly, 'you could attend to that tiresome business yourself, then.'

'By Jove, a good idea!' said her father quickly. 'Then South America it shall be. There's a boat sails Thursday week; we'll get that. By the way, Jasper, you had better come with us.'

'I, sir——?' gasped out Leighton.

'Yes; I'll need somebody at hand to help the deal through. Also, we shall be able to see what progress your new superintendent has made. Put Greaves in charge until we return, and cable the El Oro people that I am coming over in person to negotiate.'

CHAPTER IV.

IN due course Hume arrived at Para; and, after resting overnight, took the early morning train for the last five hundred miles of his journey. His first impressions of the company's methods were not reassuring. The inquiry-clerk had been uncivil, the booking-clerk negligent, and the porters very truculent; but after much shouting and blowing of whistles they started, nearly two hours late.

As it moved out of the station a young man sprinted down the platform, and, opening the door of Hume's carriage, scrambled quickly in.

'Phew!' he panted, mopping his brow; 'that was a narrow shave.'

'It was,' remarked Hume pleasantly. 'How did you manage to cut it so fine?'

'It's the fault of this old rattle-trap of a railway. I've been staying at San Uro, about ten miles inland, and after waiting an hour for my connection was calmly informed that the train had been taken off; so I hired a horse and rode down.'

'Taken off?' questioned Hume. 'But why?'

'Oh, the usual excuse; driver drunk, or hadn't turned up, or something of that sort. Still, I'm jolly glad that I caught this train. I particularly want to arrive in El Chaco by Thursday.'

'My dear sir,' said Hume, with a good-humoured smile, 'you will be able to get there and back before Thursday. It is only Tuesday to-day.'

'Not on this line, sir. I've been to El Chaco three times this month, and have not been able to do the double journey in less than five days. But here comes the conductor—as they call him in this enlightened country; ask him.'

'When are we due in El Chaco?' asked Hume, as the man examined his ticket.

'According to schedule we are supposed to arrive there by nine-thirty to-night,' replied the man, with a grin, 'but we'll get there the day after to-morrow if we're lucky, and if the driver doesn't get too drunk to read his signals.'

'Hello, Moore,' said Hume's companion, 'what's the fare to El Chaco? I've got no ticket.'

'Twenty-five milreis to you, Mr Jackson.'

'Only twenty-five?' queried Jackson amazedly. 'Why, the booking-clerk always charges me thirty.'

'Then you must pay the other five for the benefit of his health, for I'm darned sure that

the company don't get it,' replied Moore, still grinning as he disappeared down the corridor.

'What did I tell you, sir?' queried Jackson.

'But this is preposterous,' rapped out Hume. 'So long to travel five hundred miles! By George, this will have to be altered.'

'It ought to be, but it never will. You know, sir, Brazil is the country of to-morrow; things never get better, only worse.'

'I say it shall be altered, and quickly, too,' replied Hume, shaken out of his usual reserve by the trend of events, 'if I have to discharge every man on the system.'

Jackson looked at him with an air of surprise.

'Excuse me, sir, but would you mind telling me your name?'

'My name is Hume.'

'Not Mr Kent Hume?'

'The same.'

'Thunder, what a bit of luck!' said Jackson enthusiastically. 'I have a letter for you, sir.'

Hume broke the seal, and read:

'DEAR KENT,—The bearer, Cyril Jackson, is a family connection of mine, and I understand that he wishes to take up a position on the line.

'If you can make use of him I shall be greatly indebted to you.

'With best wishes for your success and all kindest regards.—Your old pal, JASPER.'

'Glad to meet you, Mr Jackson,' said Hume, shaking hands cordially with the youngster. 'I hear that you wish to take up a post with the company.'

'Yes, sir, if there is one vacant.'

'I fancy that there is going to be more than one vacant before long, so I think you may safely count on an appointment.'

'Thank you, sir; I'll do my best to deserve your confidence.'

'I am sure you will,' replied Hume evenly, as he turned the subject deftly, and the matter was left in abeyance until their arrival.

Before their destination was reached the new superintendent received a very liberal education in the methods of Brazilian railway officials, and as delay succeeded delay his orderly mind seethed with indignation at the entire absence of organisation and discipline.

After spending two very uncomfortable nights in the train they arrived at El Chaco during the early afternoon of Thursday, utterly tired out. Barely waiting to remove the traces of his journey, Hume went straight to the office, where he was obsequiously received by Malcolm, and introduced to the office staff.

'Guess we'll soon fix this funny little runt if he gets fresh,' whispered Dicksee into the ear of the assistant-superintendent.

'I'd say so,' replied his fellow-conspirator, with a wink.

A comprehensive survey of the shops, round-houses, and yard over, the three men returned to the office, where Hume amazed the two plotters by his keen, quick grasp of the figures. Now that the time for action had arrived, his diffidence had entirely disappeared, and the many shrewd, penetrating inquiries he fired at them not only showed his thorough knowledge of the details of administration, but also proved very disconcerting to his two subordinates—a fact that he was quick to observe.

Accompanied by Malcolm and Jackson, he started out a few days later, and in the week that followed toured the whole of the system in his private car, noting with the trained eye of the engineer the many miles of well-laid track, which showed but slight traces of the neglect that was elsewhere apparent even to the most inexperienced eye. And the whole of this journey only confirmed his first impressions: the line was in a state of chaos. Time-tables certainly were issued, but they were a fiasco. Never by any chance did the trains run to them; or, if they started off to time, they were run hap-hazardly, or were cut off on the slightest of pretexts at the whim of the drivers. Wayside stations he found closed down altogether in the middle of the day whilst the stationmaster slept off his carouse or decided to take a holiday. Appropriation and waste of the company's stores were rife, and, at one junction, they even had to wake up the signalman in order to get the points changed so that they might continue their journey. Finally, at Yecco, the most dangerous crossing on the whole system, some three hundred miles east of El Chaco, Hume's growing indignation burst out as the driver of the west-bound passenger train disregarded his signals and came thundering down almost on the top of the private car, which was saved from complete destruction only by the prompt action of its driver.

'Who is the driver of that train?' he snapped.

'David Wells,' replied Malcolm. 'He is one of our best men, but is difficult to handle, especially when he is drinking.'

'Get him here at once.'

Malcolm returned a few minutes later, and in his wake lurched the driver, a broad-backed, burly man in the late thirties, with a face that was lined with the traces of hard and steady drinking. He glared round the car belligerently, and after a few moments' silence burst out, 'Say, Ez, where's this guy that wants me, an' what the hell does he want?'

'That will do, thank you,' snapped Hume curtly. 'Just moderate your language; also you might remove your cap. Now,' as the man snatched off the offending headgear, 'what do you mean by being drunk whilst in charge of a passenger train?'

'Drunk, am I?' snarled Wells. 'Look here,

mister, I don't know who you are, or what the h— what you mean by fetching me from my work; anyway, here's where I beat it to my engine. I've no time to answer dam fool questions.'

'You will never mount an engine of ours again—at least not until you have learned to keep sober whilst on duty,' retorted Hume. 'Five minutes ago you risked the lives of two hundred passengers by the criminal carelessness of your driving. That mistake you will not be allowed to repeat. For the present you are suspended; report to me at headquarters, Friday noon.'

'Suspended, am I?' jeered the man, with a tipsy laugh. 'Why, mister, you must be completely batty: you haven't got another driver that can take the old west-bound through the round trip as fast as I can, and bring her home in one piece.'

'Oh,' remarked Hume dryly, 'we shall see.—Here, Snow,' to the driver of the light engine attached to his private car, 'take this man's trick, will you, and do your best to make up for lost time; it's two hours behind now.—Mr Jackson, will you take Snow's place for the moment?'

ETHNOLOGICAL TRACES IN SCOTTISH FOLKLORE.

By J. W. BRODIE-INNES.

PART I.

I.

IS it possible by means of folklore to solve any of the problems of the various races that have swept over Scotland, whose blend now forms the bulk of the inhabitants of this country? The problem is so intricate and difficult that surely any light from any source, any clue, no matter what, deserves attention and investigation. In the course of a short paper I cannot hope to do more than indicate one or two out of very many directions in which research might be expected to yield useful results.

A word of caution is necessary to start with. We must not assume, because we find the same folk-tale in two distinct countries, that either of them came from the other, or that both came from the same source. It may have been so; but, on the other hand, they may, quite as probably, have arisen independently in two widely different places; and this is especially the case with respect to so-called nature-myths. Primitive peoples trying to personify the sun, or the wind, or the weather, will do so much in the same way, and make very similar stories. Another caution, which seems to me much needed by one class of folklorists, is not to try to force every folk-tale into a weather-myth.

But, all due allowance being made for these cautions, there seems no doubt that the folk-tales of various races have characteristics of their own; and when we know from other evidence that certain races have lived here in this land, and we find folk-tales bearing the characteristic marks of the folklore of each race either actually current in Scotland, or recorded as having been current within memory, it seems we have a clue, at least as important and worth investigating as the shape of the skull, the flattened shin-bone, or other physical points.

Not positive proof, it is true, but what a lawyer might call *adminicules* of evidence.

The earliest races are lost in the dim mists of antiquity. There were Neolithic men, cave-dwellers, river-drift men. They have left their flint weapons, occasionally their rough and spirited drawings on bones and horns, but probably no tales that we have now go back to an antiquity so remote.

Then we have the rearers of the serpent mounds, the builders of the stone circles, all those who are classed together and called 'Druids'; and also the makers of those subterranean structures often called 'Picts' houses' (be they houses, or storerooms, or places of defence, or places of burial), whom Mr MacRitchie considers to have been a primitive race of Mongolian pygmies, and the origin of the traditional fairies. All of these have left material traces which we can investigate; and there are, besides, traditions of Picts, Fomors (whoever they may have been), and others before the coming of the Celt. Now if we appeal to folklore here, we do find here and there stories utterly unlike the usual character of the stories of this country, dim legends of remote and inaccessible places, where in caverns underground there still are said to dwell the last remnants of a savage and diminutive race, ugly, cruel, and blood-thirsty, desiring always to catch and sacrifice a lonely wayfarer with loathsome rites. It is very difficult to find these traditions now, partly because there remain very few unexplored and inaccessible places in Scotland, and partly because, for some reason or other, there is always a considerable reticence about recounting the very old tales. Still, here and there one may yet find old shepherds or gillies who will recall that some grandfather, or remoter ancestor, in their youth used to tell of a traveller being caught, and perhaps rescued with difficulty; and

perhaps, if one has rare luck, some ceremony of sacrifice may be described, or hinted. These ceremonies seem to have a remarkable similarity to what is told in Russian folk-tales, such as those collected by the late Mr Ralston and others; and herein may possibly lie some confirmation of Mr MacRitchie's theories, for the stories are not Scottish. In every characteristic they are utterly alien, and they are Mongolian. Some memory may be here of that primitive pygmy race; but, on the other hand, nothing can possibly be more remote from the Scottish or Celtic fairy faith, so well expounded by Mr Wentz, which is eminently kindly, graceful, and friendly to humanity (if somewhat tricky and mischievous), than these cruel, savage, half-human, half-beastial creatures, who are yet entirely material and physical.

II.

With the Celts, who came later, are inseparably associated the Iberi, and these possibly became a mixed race in Spain, the Celt-Iberian Peninsula. These Iberi the late Dr Phenè traced from Asia Minor, through Greece, Southern Italy, Etruria, Spain, the Basque Country, Brittany, the south and west of England, Wales, the west coast of Scotland, and Ireland, bearing with them everywhere their skill in gold and enamel work, and the cult of the serpent. There seems a strong probability that the serpent mounds, of which a few may be found in Scotland very similar to those in the track I have mentioned, may be due to the Iberi, and the circles to the Celts. If, as Dr Phenè thought, the name Iberi is the same as Ibri, and so connected with Hebrews—the Beni Israel, the Ibay-Erri, men of the river, or Crossers Over—we may take the curious occurrence of biblical myths in Celtic folk-tales as evidence, when conjoined with more positive proof, of this theory of origin. Many of these tales have been modernised and retold with great effect by Fiona MacLeod, Lady Cromartie, and others. As recounted at the fireside by old Highlanders, they have a simplicity and humour which is quaint and rugged, but with little of the poetry or the reverence these two writers have put into them.

Also if, as some have supposed, the Tuatha de Danann be the same as the Danai of Homer, this may perhaps be the source of the Greek element in Celtic tales which so impressed Professor Blackie.

Folk-tales are apt to cluster about the serpent mounds and the stone circles, but in the case of the former usually they are obscure and difficult to get at. The mounds are avoided; the traditions are of buried treasure, but also of terrible supernatural guardians. In the stone circles, on the other hand, there are formulæ and ceremonies that may yet be performed, and whoever can successfully invoke the presiding god of the

circle may have whatever he desires. It is natural that these stories also should be told with bated breath, and only to those who are sympathetic and able to keep counsel, for the ministers frown on such beliefs and customs. Nevertheless they are held far more commonly than is generally supposed. An elder of the Free Kirk, and a most God-fearing man, has been known to go at the full of the moon to a stone circle, and do circumambulations and sing old fairy tunes when his wife was dying. I was told the wife got well. Also it is not uncommon in some places for the girls to go on a midsummer midnight and deposit their little trinkets—tiny brooches or what not—on the central stone, and pray for their lovers, or pray that lovers may be sent to them. This belief is akin to the offerings dropped in wishing-wells or hung on wishing-trees. Of course all this is in strict secrecy.

Another relic of this old faith I have seen myself in the shape of 'cursing stones.' A circle of black stones set up by a crofter over a hundred years ago, one at the dark of every moon, between the old and the new; twelve stones in all there were, and they took a year to set up, each one with walking widdershiins, prayers said backwards, and solemn calling on the Devil. The purpose was to curse the man who had stolen his sweetheart. The grandson of the crofter showed me the stones, and told me the story; he said the man cursed took to drink, fell from a roof, broke his back, and died a lingering death in great agony. Of course the evil magician should have come to some terrible end, but I was told he married and lived prosperously to a green old age. So this pagan faith still flourishes; not so markedly as it does in Brittany, but yet quite notably if one knows where to look for it, and how to coax the stories out of the people, which is not easy.

III.

The principal admixture of pure Celtic folklore comes from the Scandinavian immigrations, and to disentangle this we need to compare the stories as told in the West Highlands and the Islands with similar stories told in the extreme west of Ireland. For, by history and tradition, where the Gael of Scotland absorbed the Norse invaders, a section of the Irish retreated before them into the wild west, and preserved the purity of their race and their legends, but lost the strength and vigour that the Scottish Gael gained from the blend.

Pure Gaelic mythology covers a wide field, ranging from the Ossianic epic, through romantic and chivalric stories, such as those belonging to Finvara and the Riders of the Sidh, the semi-religious legends of a future life in Tir nan Oge, the Celtic Paradise; the stories of Elementals, particularly the Elementals of the Waters, including all the tales of seal-men and

seal-women, those curious half-human creatures who sometimes take wholly human form and intermarry with the children of men; and again, to the pure nature-myths and weather-myths, of which there are plenty.

Most of these stories are current also in Norway, but there is a notable variation which runs through them all. Among the pure Celts the Elementals are gentle, kindly creatures, very friendly to the race of Adam's breed. But with the Scandinavians they are fierce, cruel, and revengeful. In Irish bardic tradition we find the pure Celtic spirit, as shown in the stories of the Daughters of Lir, and of Mananaan Mac Lir, the old gray wizard of the sea, who advised and befriended the swans. But in Norway woe betide him who meets the Kelpie of the Waters, the fierce and terrible sea-horse, with whom may be instructively compared the white horse of O'Donnoghue, Prince of Breffni! Both these types, often blended, may be found among the local traditions of the Isle of Skye, where also the blend of races is very marked. The relation of the Ash Yggdrasil of Scandinavian mythology, whose boughs stretched out into heaven, its highest point overshadowing Walhalla, and its roots reaching down to dark hell, with the rowan or mountain-ash has yet to be worked out; but there is no doubt that there is a remarkable similarity in some of the legends, and a great store of folk-tales cluster round the rowan-tree, as also they do around the *Sambucus racemosa* or red-berried alder.

The story of the Forsaken Merman, so beautifully told by Matthew Arnold, is common in Norway, Sweden, and Denmark. In the Isle of Skye, formerly colonised by Norsemen, there are three ballads on the subject. Rhythmically they are akin to the Danish ballad of 'Agnes and the Merman,' but it is noticeable that in the Norse legend the merman is the water-horse, the Rosmar, a huge, uncouth creature of the arctic waters, fierce, savage, and cruel, though he could assume any form, and, in the likeness of a man, married Morag. But in the Celtic form of the story he is gentle and lovable. There are exhaustive notes on this legend in 'Hind Etin,' Child's *English and Scottish Popular Ballads* (large edition); also R. C. Prior's *Ancient Danish Ballads* (vol. iii.), under the title 'Agnes and the Merman.'

The Celtic folklore of the Western Highlands seems to have a genius for absorbing and assimilating the stories of other races, and that not only the Scandinavian; even as the Celts themselves have absorbed the races that came to conquer. A notable example of this is in the famous fairy flag of Dunvegan. It is said this flag was given to a MacLeod by a mermaid whom he loved, and who loved him, and promised to come to his help, or that of any of his race, whenever the flag was waved; but, alas! MacLeod proved false to the sea-fairy, and the

power was restricted to three waves only. The association of a flag, which distinctly belongs to air or fire spirits, with a water Elemental, is in itself curious, and the story itself has somehow an exotic flavour about it. And when we look at the flag itself closely, there is little doubt that it is a piece of Saracen embroidery. With this clue, we study the Moorish, Saracen, and Arab traditions, and we find many similar tales of enchanted flags whose waving brought the help of Elementals. There seems, then, great probability that this flag was in fact brought home by some crusading MacLeod, possibly with an Eastern bride, whom he deserted, and that the people of Skye adopted and adapted the tale, fitting it on to a mermaid, as being to them the most likely source of a fairy gift. The battle of Mille-garaidh, in Waternish, is said to have been the last occasion when the fairy flag was unfurled, with an unfortunate result for the invaders from Clan Ranald, who, falling under the spell of the flag, thought they saw a vast concourse of armed men, whereas in reality there were but a handful, so that they fled in terror to their galleys, and were almost cut down before they reached the shore. This was in 1570.

IV.

There is another class of stories which are found in some form or other very widely distributed: those, namely, of mortals who are carried away by the fairies or some kind of supernatural beings, to reveal for a period that appears to them like a single night, but which, in fact, varied from seven years to three hundred in the case of Ossian. These tales are found among the Arab folk-stories. The American Rip van Winkle has certainly a Teutonic origin. But it is claimed that similar traditions were current among the North American Indians. And there are legends of the same nature among the Maoris, whose folklore is among the most interesting and instructive that exists. It is impossible to say that any of these are derived from any other, and we must almost needs conclude that they rose independently. But in the Celtic variants there is a distinctly individual type, and in these stories we find a much nearer approach to the fairy-tales of our childhood than in most of the folk-stories. A noticeable legend belonging to this type is associated with the well-known Gaelic tune—*Croth Chailein*, or *Colin's Cattle*. There are several variants of the story. In its main lines the betrothed of Colin, a wealthy young farmer, was carried off by Finvara and the Riders of the Sidh; Colin was a favourite of the Fairy Queen, and went to ask the return of his sweetheart. Now, by fairy law she must remain for a year and a day (perhaps reminiscent of the custom of handfasting); but it was allowed that she might milk his cattle every evening, and though he could not

see her, he might hear her milking-song. At the end of the time she was restored to him. Here we find Finvara and the Fairy Queen at variance, and a glimpse of the laws of fairyland, which in Celtic mythology was a very definite place. Moreover, we have the association of the legend with a certain tune, which is classed by Dr Keith Norman Macdonald as one of the fairy-tunes.

In these fairy-tunes, again, there is material for careful and systematic investigation. According to tradition they were heard by pipers when sleeping on the fairy-knolls, and played over when they woke. For the most part they were never scored, but passed on by ear from one piper to another, and may be of very remote antiquity. Dr Macdonald finds in the fairy-tunes special qualities which are not found in the Gaelic folk-tunes, and these very qualities have by other musicians been thought to be similar to Egyptian music. There is an old legend telling of the Egyptian immigration of a band of refugees under Galecthus, an Achaian, and Scodra, the daughter of Pharaoh, with a following of Egyptians. Possibly the folk-music, as exemplified in the fairy-tunes, might form one clue to this ethnological problem.

Another may be found perhaps in folk-dances. These have hitherto been too little studied in connection with folklore. There is no doubt that they open a very wide field for research. In all countries there have been two leading classes of folk-dances—the war-dance and the temple or religious dance. The primitive dances of North American Indians, Maoris, and others may well be taken as examples, for the special character is strongly marked and the purpose of the dance unmistakable. They will not perform a war-dance for social amusement. A broad distinction seems to emerge from the accounts of all these dances. A couple dancing opposite to each other, as in the Irish jig or the contra-dance—miscalled country-dance—is a social amusement usually symbolic of courtship; the crossing figures, combined with setting movements, recall the charge in battle, stir the warlike passions, and are characteristic of the war-dance. The circular dances, in which the performers either move in a circle or wind in and out in circles going opposite ways, are distinctly religious, belonging to the circle temples, and probably connected with serpentine movements and the serpent cult. With this clue we may, with some probability, conjecture that of the characteristic Celtic dances the reel was a war-dance; the Skye eightsome a religious dance, in which possibly the number eight had a special significance; and the so-called *schottische* merely a social amusement. The sword-dance is a display of skill, and has, with some probability, been ascribed to the triumphant dance of the victor after a fight, when his foeman's captured claymore was

crossed with his own on the turf. The study and comparison of the dances of those races which have combined in our Celtic population might yield valuable hints.

V.

When we come to the eastern side of Scotland, and the so-called Lowland peoples, the character of the folklore is entirely changed. In the Lowlands it is Teutonic. The folk-tales are mainly concerned with ghosts and hauntings. If we meet with Elementals at all, they are neither the gentle, kindly folk of the Celt, nor the fierce and revengeful type of the Scandinavian, but rather gruesome and horrible. Also on this side of Scotland, and among the Teutonic races, we get the witch legends very prominent; and in some districts the cult of the witch persists to the present day. The hauntings generally deal with crime or are entirely unexplained, possibly unexplainable, as in the well-known case of Glamis. The Banshee bears a Celtic name, but as a death-warning spirit I have personally known very many more Banshee traditions attached to certain families and properties in the Lowlands than among Celts.

All these stories follow much the same lines. We hear of ghosts that haunt certain places, and are seen by animals. Horses shy at particular places for no obvious cause; dogs are terrified, though nothing can be physically seen or heard; men occasionally see dim figures. Ghosts are seen about certain houses; tragedies are continually re-enacted. Usually these are revenants of murderers or murdered persons. There is a striking similarity between these tales and the native folklore legends of Germany, which point to their Teutonic origin. I say advisedly 'native,' for the graceful fairy-stories of Germany nearly always, on investigation, prove to be either French or Celtic in their inception.

(Continued on page 253.)

SUNSET OVER YOUR HOME.

THE Lord of the Day came riding late
O'er the pearl and golden plain.
He tied his horse to your woodland gate
With a loop of his crimson rein,
And took the path through your tasselled firs
With a splash of flame on his jewelled spurs.

He crossed your lawn with a silent tread,
He struck his glove on your mansion door;
The gray walls gathered his banner red
And the rose that his helmet bore.

And I wondered long as I watched him pass
Through the amethyst-opal ford,
And gallop away on the purple grass
With a star on the hilt of his sword—
If he knew that you were the fairies' friend
With your fancies quaint and wild,
With your house of dreams at the rainbow-end
And your heart of a little child.

WILL H. OGILVIE.

Chambers's Journal

SEVENTH SERIES

SOME INTERESTING SPOTS IN SOUTHERN RHODESIA.

By J. PATERSON.

I.

OVER a decade ago there was a considerable influx of visitors to Rhodesia annually from Great Britain, America, and other countries; and since the close of the Great War the flow has recommenced, with the intending settler more in evidence, however, than the tourist. Additional interest is lent at the present time to the coming of these seekers after new homes, because of the probability of changes occurring in the fiscal and other conditions of Rhodesia through the *régime* of the old Chartered Company giving place to a system of responsible government.

A few days may be spent profitably in Cape Town before the traveller from overseas entrains for the far north. The tram ride to Camps Bay affords a magnificent view of Table Mountain and the Atlantic Ocean. At the other end of the city, Groote Schuur—the handsome residence set apart with prophetic insight by Cecil Rhodes for the Prime Minister of united South Africa—will be found full of interest. A visit should also be paid to the municipal gardens, where, among rare examples of subtropical trees, plants, and flowers, a statue of Rhodes stands, one hand uplifted and pointing northwards to 'Your Hinterland,' to suit the inscription chiselled on the stone.

For the first 130 miles of its journey the Zambesi express passes through the rich fruit-growing districts of the Cape Western Province, where upwards of 150,000 tons of grapes and stone fruits are produced annually. After a view of the mighty Matroosberg (7434 feet high), the train commences its ascent of the Hex River Mountains, and during the subsequent 16 miles an altitude of 1566 feet is exchanged for that of 3195 feet, the ruling gradient being 1 in 40, and the location of the track a veritable triumph of engineering skill.

The Great Karoo commences at the top of the mountains and extends to De Aar, a distance of 350 miles. It is said that this was once an inland sea with rich vegetation adorning its edges, but it is an arid expanse nowadays, suitable only for the grazing of sheep and goats. A marvellous transformation, however, follows the occasional rainfalls, when, as if by magic,

the parched-up plain becomes a vast carpet of verdure and exquisite wild flowers. There is practically no twilight on the Karoo. At De Aar a line branches eastwards to Naaupoort—whence tracks double back to the coast at Port Elizabeth and East London, and another line (the original route to the Transvaal) runs northwards through the Orange Free State to Johannesburg and Pretoria. But the Zambesi express proceeds on its northward way, passing the battlefields of Belmont, Graspan and Enslin, Modder River, and Magersfontein, and travelling through veld with only slightly more verdure than was to be seen in the Great Karoo.

As you travel due north of De Aar the first place of importance is Kimberley (647 miles from Cape Town), where the De Beers Company, of which Rhodes was one of the founders, are usually prepared to show visitors over their property. The chief mines are named Kimberley, De Beers, Du Toit's Pan, Bultfontein, and Wesselton respectively, and the town of Kimberley is the centre of the diamond-producing area. These five mines are contained in a precious circle three and a half miles in diameter; they are irregularly-shaped round or oval pipes, extending downwards and narrowing in depth, which are considered to have been volcanic necks filled from below with a heterogeneous mixture of fragments of surrounding rocks, and of older rocks such as granite, mingled and cemented with a bluish hard mass, in which the imbedded diamonds are hidden.

Mafeking, of siege fame, is the next place of interest, from which town the Kalahari desert may be entered; this desert is a slightly undulating plateau, 1000 miles long and from 300 to 500 miles wide, where game is plentiful and indications of latent mineral wealth have been found.

II.

Ramaquabane is the boundary between the British Bechuanaland Protectorate and Southern Rhodesia. If the light be good the traveller will soon catch a glimpse of the Matopo Hills in the east, and from this point onwards for about fifty miles he will obtain more or less distinct views of the Matabele fastnesses.

Bulawayo, literally 'the place of killing,' is 1360 miles from Cape Town; it has a popula-

tion of about 7000 Europeans, and is the centre of the mining industry of Matabeleland. It was first occupied by a British force towards the close of the Matabele war of 1893, and the railway made its appearance four years later. Government House, built on the site of Lo 'Bengula's kraal, is approached through an avenue two miles long; and near the Residency is still to be seen the 'indaba' tree under which the famous Matabele chief was wont to sit and dispense justice according to his own peculiar code. The memorial hospital was erected in memory of Major Alan Wilson and his comrades, who were cut off by the Matabele at the Shangani River on 4th December 1893, and whose remains were ultimately interred on the Matopos. The town possesses many fine public and private buildings, and a bronze statue of Mr Rhodes stands in the main street opposite the Bulawayo Club.

Whereas diamond-mining at Kimberley and gold-mining on the Rand are controlled by syndicates and conducted on a colossal scale, Rhodesia may be termed the country of the individual miner, and its gold winnings are therefore more evenly distributed among those engaged in the actual operations than is the case in the two Union Provinces.

But apart from its mineral wealth, actual and potential, Rhodesia is peculiarly adapted for stock-raising and the cultivation of maize, tobacco, cotton, and oranges. There are now close on two million head of cattle in Southern and Northern Rhodesia, and the competition at the Bulawayo annual show is invariably keen, particularly for the British South Africa Company's one thousand guineas trophy, which goes to the owner of the best bull on exhibition.

Severe droughts such as obtain in the Union of South Africa and in Australia are unknown in Rhodesia, where the rainfall averages from 20 to 40 inches. While rapid changes in temperature are of frequent occurrence, and though light winter frosts are usual, cattle rarely suffer from cold to any appreciable extent, and the mean elevation of most of the country prevents anything like excessive heat.

An impression appears to exist abroad that good land can be had in Rhodesia for a song, but the days when that was true are long since past. Still, the price of land is comparatively cheap, contrasted with other countries, and when the attractions of Rhodesia are considered. Ranching land in large blocks varies in price according to situation, accessibility, altitude, and natural advantages as to the quality of its grazing, shelter, and water, but the usual figure is from 5s. to 10s. an acre; land suitable for arable farming costs from £1 to £3; land on the sand veld ranges from 5s. to 15s.; and farms on the red soils run usually between 15s. and £1 per acre.

That prime necessity of all ranching countries,

namely, the presence on the spot of a suitable type of foundation stock upon which to build improved herds, is very fully met in Rhodesia. The native cattle of the country, to the number of about three-quarters of a million head, have been found to make an excellent foundation, being extremely hardy and immune—or nearly so—to many diseases of the tropics, qualities which are transmitted in a large degree to their graded descendants. Though small, the general type is not a bad one, and has frequently been admired by visiting cattlemen. Female breeding stock is easily obtainable at low rates, heifers and cows being worth from 50s. to £7, according to size and quality. These cattle may be regarded as a fixed breed, the Mashona, probably as an ancient one; and therefore pure-bred and sound prepotent bulls of European breeds are required to eliminate the more objectionable features, of which smallness is one of the most noticeable.

Rhodesian oranges and maize are now finding their way to the overseas markets, and the export of dead-meat on a considerable scale will commence in the near future; in this connection it is interesting to compare the relative distances from London of the chief meat and maize exporting countries. By mail steamer the distance to England from Wellington, New Zealand, is 46 days; from Sydney, Australia, 43 days; from Adelaide, Australia, 38 days; from Durban, South Africa, 22 days; from Buenos Aires, Argentina, 20 days; and from Cape Town, 17 days.

III.

The Matopos—a range of granite hills covering an area of about a thousand square miles—are located some twenty miles to the south of Bulawayo. At the Matopos Hotel horse or mule conveyance can be obtained for the six-miles' trek to the foot of 'World's View,' the route being through a park and past zoological gardens somewhat similar to those near Groote Schuur on the slopes of Table Mountain. The extent of the park is about 18,000 acres, on which are fifteen miles of made-up roads. The zoological gardens form a natural sanctuary for fauna; and from the roadway some fine specimens of sable and roan antelope, eland, bush-buck, and giraffe may be seen grazing fearlessly. An interlaced fence round this zoo encloses an area of four miles. From the foot of World's View to Rhodes's grave on the rolling granite plateau, a distance of about a mile, has to be traversed on foot.

During the Matabele rebellion of 1896–97 Cecil Rhodes, accompanied by Mr Colenbrander, went unarmed to the Matopos to parley with an assembly of native chiefs, and the result of the palaver was a cessation of hostilities. Rhodes was so impressed with the magnificent panorama obtained from one of the hills that he named it

'The View of the World'; and on this hill, at his own request, he was buried—over twenty years ago.

About eighty yards south-east of Rhodes's grave is a vault wherein lie the remains of Alan Wilson and his party, the inscription on the adjoining monument reading: 'To brave men; there was no survivor.'

On 22nd May 1920 the remains of Sir Starr Jameson were laid finally to rest in a third tomb, hewn out of the giant boulders of the Matopos. From the earliest days of their association to the moment when, on his death-bed, Rhodes 'called in a clear voice for Jameson,' there was constant unity of purpose and community of thought between the two men. Their friendship began in the old Kimberley days, and Rhodes's was the driving impulse that sent the young Edinburgh doctor from a brilliant and prosperous medical career to embark on a Great Adventure in the far north. An authentic story is recorded of how Rhodes was met in 1897 by one who told him that he had very bad news. Dr Jim was lying ill at the time. Groote Schuur, the great man was told, had been burned down. 'Thank God!' said Rhodes, with a laugh of relief; 'I thought Jameson was dead.'

The tomb of Jameson is east of that of Rhodes, and nearer the Shangani Memorial than the latter. Like that of his chief, it is covered with a great granite slab bearing a brass plate, on which is simply inscribed: 'Leander Starr Jameson.' And there, guarded by the shades of Major Alan Wilson and his gallant warriors, it is fitting that the great Englishman and the intrepid Scotsman should slumber peacefully together in the lands that they won.

IV.

Southern Rhodesia abounds in ancient ruins, and many theories have been advanced as to who the original builders of the forts and temples were. The majority of writers appear to agree that they were Himyarites or Phœnicians, and some affirm that Rhodesia is the Havilah mentioned in Scripture, whence the gold was obtained for King Solomon's temple. Of the many ruins, those known as the Great Zimbabwe are in the best state of preservation; they are situated 15 miles from the township of Victoria, which is 200 miles east of Bulawayo by rail.

The Great Zimbabwe, literally 'here is the great kraal,' comprises several groups of ruins, including: (1) the Temple, or large elliptical ruin, with a round, conical tower; (2) the 'Valley of Ruins,' lying between the Temple and Acropolis Hill; (3) the Acropolis, an intricate fortress on a hill half a mile due north of the Temple.

Unlike the Israelites, the Arabians were learned in science and remarkably skilled in astronomy. The Zimbabwe temple is oriented

and geometrically built for astronomical purposes; set on the top of its lofty, hewn-stone walls, 35 feet high, are large stones—gnomons—for observation of the stars, and to measure shadows cast by the sun.

In Solomon's time, most likely, the Great Zimbabwe was a large and populous city, as may be judged from the fact that its recognisable ruins cover an area of more than three square miles; and it must have been formidably fortified. In the middle of it rose an isolated granite kopje, 250 feet high, which was crowned by a fortress. In its day this fortress was probably one of the strongest in the world, its south side being defended by 90 feet of sheer precipice, while massive labyrinthine walls rendered approach to the summit possible only through narrow passages easily blocked.

It is deduced, too, that the mines of King Solomon were worked by a multitude of negro slaves, the gold output being brought to the Great Zimbabwe for conversion into ingots; then caravans departed eastward for the seaport now called Sofala, a journey of 200 miles, carrying gold, ivory, and other precious merchandise destined for Palestine and Arabia. Among the ruins, in recent years, have been found gold, copper, bronze, and great quantities of iron implements and tools. It is thought that some of the workings date back to a period before the birth of Moses; so it may be that the Great Zimbabwe is 4000 years old. These workings extend over a vast area, but none of them are found in the immediate neighbourhood of the Great Zimbabwe, which city would require large food supplies, and it is surmised that the territory in its close vicinity was used for the growing of cereal crops.

V.

Returning to Bulawayo, the traveller sets forth on the final and most spectacular stage of his journey northwards—to the Victoria Falls. For the first thirty miles the train passes through the Khami Valley, replete with ancient ruins, depicting all four periods of Zimbabwe architecture, but now one of the principal maize-growing districts of Matabeleland. Twenty miles farther on, at Hardwood Spur, is the centre of a forest of mahogany and mopani trees, the twisted and otherwise extraordinary shapes of many of the latter being attributed to elephants, which at one time swarmed in this region, trampling down and bending the saplings.

Passing over the Gwaai River bridge, the train enters the longest straight section of railway in South Africa, the line being without a curve for the next seventy-five miles. Later, the country takes on a subtropical aspect, giant boulders—looking like so many castles—being passed, and great baobab trees standing out in bold relief among the teak. The train then winds along the Katuna Valley, the route supposed to have

been taken by Dr Livingstone in 1855, when he discovered the Falls.

Victoria Falls railway station is 280 miles west of Bulawayo, but seven miles short of it the spray arising from the Falls may be seen, and at two miles' distance the roar of the waters can be heard above the steaming of the engine. There is a good hotel abutting on the station, and its grounds cover several acres, through which paths lead to the Falls and other places of interest. The nearest European township is Livingstone, four miles across the bridge which spans the Zambesi River, marking the boundary between Southern and Northern Rhodesia.

The Victoria Falls, the native name for which is 'Mosi-oa-Tounya,' meaning the 'thunder-sounding smoke,' are 5808 feet wide, and the heights of the perpendicular cliff vary from 254 to 368 feet. (The Niagara Falls are 3640 feet wide and 167 feet high.) The formation is unusual, a rent in the river-bed having resulted in a huge gap in the basaltic rock, into which the Zambesi plunges; the mighty river—in some places above the Falls it is nearly two miles wide—suddenly leaps into a trough 400 feet deep and a mile long, to emerge again with indescribable fury through one small opening of 100 yards, whence it continues through a gorge banked by cliffs for over forty miles, until it once more widens out into a broad and comparatively tranquil stream.

Close to the Falls is the Rain Forest, a beautiful woodland of tropical trees and undergrowth, where exists the phenomenon of perpetual rain. This is caused by the tremendous impact of the great volume of water falling on the rocks below, the pressure forcing part of it back into space, where it dissolves into a great cloud of steam-like vapour, forming a fine descending spray.

The best view of the Rainbow clouds is obtained from a point between three and five miles up the river, where Dr Livingstone first saw them. He thought they were the smoke of burning grass or forest. As he saw it, and as it usually appears to-day, the 'smoke' ascended in five separate columns; whilst rising it was white, and when it reached its highest point it appeared black. As the columns of vapour became visible, there was heard a dull, roaring sound, like the sound of fire driven by a strong wind.

Several days can be spent at the Falls without risk of weariness. There are the Main Falls, the Rainbow Falls, and the Eastern Falls to be viewed and explored; the Rain Forest, the Palm Forest, and the Grove to be entered; a trip to be undertaken to Leaping Waters, and along Knife Edge; and a descent to be made to the Grand Cañon, where a close and magnificent view of the whirlpool is obtained, so close, indeed, that pieces of vegetation may be thrown into the vortex.

A short distance beyond the station, and overlooking the Falls, the railway track is

carried across the Zambesi by a bridge 650 feet long, about 400 feet above the level of the waters. This bridge is built on the trussed-arch design; each section was built out towards the centre from the sides, and so accurate were the calculations and measurements that, when the centre was reached and the last piece of bottom-boom ready to be lowered into position, it was necessary only to await the lower temperature of the following morning for the booms and bracing to meet exactly. A simpler structure would have sufficed had the Zambesi been bridged farther up, but it was Rhodes's wish that persons entering or leaving North-West Rhodesia here should be afforded from their railway-carriage window a complete and ready view of one of the wonders of the world.

Beyond this bridge the railway has been extended—in pursuance of Rhodes's 'Cape to Cairo' dream—for many hundreds of miles through North-West Rhodesia to the Belgian Congo. Wild animals are not uncommon in those parts, and gangers can recount true stories of lions refusing to leave the track on the approach of a train, usually with the same unhappy result for the king of beasts as threatened the proverbial 'coo' in the early days of railways. But it is an American who vouches for the veracity of an adventure, here recorded, which happened to him whilst hunting big game in Rhodesia, *before* the United States went bone-dry: 'I saw a magnificent lion, and was on the point of firing, when, with a terrible roar, he sprang at me. Fortunately, he misjudged my height and jumped at least two feet over my head, and then rushed away into the bush. Early next morning I and my guide started to track him. After several hours we came noiselessly upon him. And there, in a clearing in the forest, we saw the lion—practising low jumps!'

LOVE'S NEST.

HOME is wherever the nest may swing—

In the topmost bough of the highest tree,
Whence pæans of praise from the linnets ring;
Or low in the grass, whence the minstrelsy
Of the songster nearest to heaven's doors
In eddies of exquisite music soars.

Love, with his heaven-born music too,
Pitches his nest sometimes as low,

Yet rises, as only love can rise,
Above the earth and beyond the skies;
Yea, singing even at heaven's gate,
With an angel's note to his chosen mate.

For love than the lark is more near to heaven,
And the hue of his wing with an angel's vies;
The crown as well as the cross is given
Because of his gift of sacrifice.

EDITH C. ADAMS.

A GIPSY OF THE NORTH.

CHAPTER XII.—SCOTCHED.

AS they drove down the river, Roy Carwyke glanced back once or twice to the pine-covered hill whence the shots had come. Was the rifleman Eskimo Billy or the Russian? The former, surely; for unless the giant possessed tremendous powers of recuperation, it was scarcely possible that he could have followed the party so far. And with the ex-whaler on the trail, things that had been of hopeless aspect took on a rosier hue. If Billy, who had already stampeded the party, followed them carefully, it might be possible to pick off first one and then another of Norma's enemies, and in the end effect the girl's deliverance. His mind turned to the consideration of his late companion's unexpected appearance on the scene. Billy must have found the message within a very short time of his own departure on the trail of Norma's captors and—

'Great Jove!'

The interjection came from Standifer, who was behind him, and glancing swiftly round, he saw the man's dark eyes aglow with triumph.

'What is it?' he asked.

Standifer laughed silently, and then answered with another laugh. 'The Lord or the devil hath delivered those fools into our hands!'

'How?'

'In their hurry they've shoved the ammunition in the wrong canoe. It's in that waterproof packet behind you. Just pass those rifles down this way, and then keep on paddling. We'll give those rascals the surprise of their lives in a moment.'

Carwyke, realising the tremendous change in the situation made by this oversight of the two scoundrels ahead, passed the rifles as directed; and presently he caught the click of a breach-bolt, and knew that Standifer was in a position to start hostilities. He looked hastily round.

'Surely you're not going to fire on them whilst the girl is between them?'

'Why not? They're no further use to me. And if they discover we have the ammunition they won't hesitate to get me—the treacherous dogs.'

'Wouldn't it be better to wait until they land? Even if they tumble to the mistake they've made, they will count on you not discovering it, and hope to rectify it at the next camp. Besides, their magazines will be full and—'

'Afraid?' jeered Standifer.

'For myself, no! For the girl, yes! If hostilities commence, she is in a dangerous position. Besides, there's the man behind.'

'What of him?'

'Well, whilst this party is united in his eyes it will make him cautious. He won't approach too close, but if he finds its numbers lessening he may become bolder; and if he does not break cover in these woods you won't be able to get him.'

'There's something in what you say,' agreed Standifer; then he broke into a chuckling laugh. 'We'll disarm the dogs, and I'll make them work as they never worked in their lives before. . . . Are you prepared to take my orders?'

'Against those fellows, yes! Against Miss Norma, no!'

Standifer laughed mockingly. 'I don't want your help with the girl. I'll manage her all right! When we land I just want you to disarm those fellows when I give the word. They're no friends of the girl, remember.'

'Oh, I'll do that!'

'Then it's settled. Pass the word to Mardock how we stand—quietly; sound travels on water, remember.'

Carwyke passed the information as directed. Mardock received it nonchalantly enough.

'A hold-up, hey? I'm in!'

As he paddled, Carwyke heard the man behind him laugh once or twice, no doubt at the thought of the surprise awaiting the mutineers; and when an hour had passed without anything particular happening, Standifer gave a sudden chuckling laugh.

'Breakers ahead! Get ready! The moment for action comes, if I'm not mistaken.'

The river had become swifter, and the roar of rapids was in the air. Watching, Carwyke saw the leading canoe making for a landing-place that offered, and in the same moment heard Standifer's tense whisper: 'Pass this gun along to Mardock. Below the thwarts. Don't let those dogs see you.'

Carwyke stretched a hand for the rifle, and as his grip closed on it, for one moment hesitated. Should he retain possession of it, and force Standifer—

Something was thrust hard against the small of his back, and he caught the laughing whisper of the man behind him.

'Pass it on, Carwyke. I have you hipped.'

He passed the weapon forward, realising his own utter helplessness, and Standifer laughed again.

'Good boy!'

The first canoe was already inshore; Norma and the men had stepped out, and the latter were in the act of lifting the canoe out of the water, when the second craft drove inshore not

three yards from them. Standifer, rifle in hand, leaped out.

'Hands up!' he cried, as Mardock also gained the bank and levelled his rifle.

The man Bull looked up and laughed brutally.

'That dog won't fight, Standifer! I calls yo'r bluff!'

'You do? Then——'

The rifle cracked suddenly, and the cross-eyed one, less sure than Bull, in the act of reaching for a rifle, suddenly dropped his hand, gave a yell, and in his surprise fell into the water.

'By all the devils in——' began Bull.

'Put them up, Bull! Quick!'

Bull a little uncertainly put his hands up, the tips of his fingers at the level of his shoulders; and whilst the cross-eyed Tick was still scrambling out of the water, Standifer spoke again.

'Now, Mr Carwyke, if you will oblige. The rifles from the canoe first; then you can strip Bull and Tick of their personal ironmongery.'

Carwyke, very conscious that Norma was watching him with contemptuous eyes, followed Standifer's instructions, and lifted the two rifles from the canoe.

'Eject the shells,' was the next order; 'and just hand them to Mr Mardock.'

When he had done as directed Carwyke searched the mutineers, stripping them of everything that might be turned into a weapon of offence. When he had finished Standifer laughed. 'Excellent. And now, Bull, you can bind up Tick's hand, whilst Mr Carwyke goes down-river to find out the length of the rapid and learn whether it is necessary to make a portage. Thank you, Carwyke,' he said in insolent mockery. 'I shall be obliged if you will make haste. Whoever the man who is following us may happen to be, we make a rather conspicuous mark here.'

Without a word Carwyke turned and began to make his way down-stream, but once out of sight among the trees he did not hurry. He had not the slightest doubt that the man behind them was Billy, and it was no part of his own scheme of things in any way to assist Standifer in his nefarious purpose. The longer they were delayed the better would be Billy's chance of overtaking them; and it was essential that he should be able to keep in touch with Norma's captors. To that end he must delay the party as much as he could, and it rejoiced his heart when he saw that the rapid was a bad one, and that a long and difficult portage would be necessary.

It was a good two hours before he returned, to find Standifer walking up and down, fuming with impatience, whilst Mardock sat upon the bank, rifle in hand, a watchful eye upon the disconsolate ruffians who had suffered the reversal of fortune.

'Confound you! Where have you been?' broke out Standifer stormily.

'Inspecting the rapid,' answered Carwyke quietly. 'It's a bad one, and a two-mile portage will be necessary.'

'Then get busy. That dog Tick is no use at present. I think we'll leave him to shift for himself, and——'

'If ye do, Standifer, ye'll leave me too, I reckon.' It was Bull who interrupted, and as he spoke there was a stubborn look on his battered face.

Standifer looked at him curiously, then laughed. 'Honour among thieves, hey? I didn't expect it of you, Bull. Well, we'll see. Work as you know how, and maybe I'll grubstake you when we get to the edge of this d——d wilderness.'

'Mebbe ye will, Standifer, an' mebbe ye won't get away wi' this game for a grubstake an' nothin' more. Ye're top dog now, but by an' by——'

'Get going!' broke in the man whom he addressed. 'Sharp, or I'll have the pair of you left to the wolves.'

He spoke gently, but there was a menace in his voice which convinced the truculent Bull that he meant just what he said. The man shambled to his feet, and under the other's directions Carwyke and he began to pack the stores down the river, Mardock, rifle in hand, marching behind them to see that no tricks were attempted. It required two journeys to get the stores down to navigable water, and when that was done there remained the canoes. Carwyke, who was really in no condition for such work, was exhausted when he reached the landing-place after the second journey, but Standifer eyed him callously. 'No time to waste, Carwyke. We've got to push it, you know.'

'But there's a limit——'

'Not in this outfit,' retorted the other sneeringly. 'You've got to outstrip the limit if you come along with——'

He broke off sharply; and the man whom he addressed, following his eyes, divined the reason for the abrupt termination. Norma had turned, and was watching them with a doubtful, questioning look in her eyes; and Carwyke divined that, whatever she had been told, the other's domineering, sneering attitude had awakened suspicion in the girl's mind. Possibly Standifer realised that also, and deemed it impolitic to continue on the same lines; for, with a complete change of manner, and with an air of solicitude, he said, 'By Jove, you do look knocked out, though! Maybe Mardock can manage the thing with Tick's one-handed help. What d'you say, Jim?'

'Well, if Carwyke will carry the rifles——' began Mardock, with a sardonic gleam in his eyes.

'I'll manage them,' interrupted Standifer sharply, and moved to take possession of them.

The girl took a step or two that brought her close to Carwyke. The doubtful look was still in her eyes, and it was clear to him that she wished to ask a question. 'You—you——' she whispered, and broke off.

He guessed what was in her mind, and answered quietly, 'I am not trusted with arms, as you see.'

Her look of puzzled doubt grew more pronounced, and as she glanced towards Standifer something very like suspicion gleamed in her eyes. 'That man who fired on us?' she asked quickly. 'Was he the Russian?'

'No! Billy, for a thousand pounds!'

'Then——'

Her face flushed painfully, and as she looked at him his heart leaped. Trust again shone in her eyes, and he knew that she was engaged in self-reproach for having permitted herself to believe evil of him.

'Oh!' she whispered. 'I could die of shame.'

'But you won't, I hope,' he began smilingly. 'Billy would never forgive me if I——'

'Come along, Carwyke!' Standifer's voice broke in peremptorily. 'And you, Miss Manning. Get ahead. I'm the rearguard.'

The narrowness of the trail compelled them to move in single file, and the roughness of it forbade further speech; but Carwyke did not greatly mind. The girl trusted him again, and their old relationship was re-established on a firmer footing. Whatever Standifer might say or do, Norma's mind would not again cherish suspicion against him. Tired as he was, he found himself whistling a cheerful air, until Standifer behind him broke in on it.

'You're infernally merry, Carwyke!'

'My nature!' he retorted.

'Then check it,' growled the other. 'A whistle carries a long way in these woods!'

'You're afraid of Nicholovitch——'

'I am afraid of no man who meets me in front. But I don't want to be plugged between the shoulders.'

Carwyke smiled to himself; and, glancing round once or twice as he missed Standifer's step behind him, saw the scoundrel standing in listening attitude, looking backward through the trees. That the other was a little rattled was clear, and the fact in no way displeased him. If Billy trailed the party carefully, harassing it unseen, it was possible that his efforts might result in a demoralisation in which there would arise a chance for Norma and himself to break away. But that, he knew, was not to be counted on. Standifer, however disturbed he might be in mind, was a resolute man, who would not easily let Norma slip out of his hands. Also there were other contingencies to be reckoned with. As he stumbled along the rough trail, his mind was busy with these

and with some of the questions arising from them.

Why, having experienced the hostility of Bull and his partner, did Standifer carry them along with him? Not from any motive of humanity, he was sure. No such consideration was likely to enter into any action of Standifer's. There must be something else. Was the fellow afraid that if he turned the rascals adrift in the wilderness, they would join hands with the man behind? That was just possible, if Standifer believed that the shadower was the Russian. But did he believe that it was Nicholovitch, or did he suspect that the pursuing man was Eskimo Billy? Carwyke could not decide, having no knowledge of the real condition in which Standifer had found the giant at Little Novgorod, and his mind reverted to the problem presented by the mutineers.

Did Standifer really mean to use the men, drive them, work them to the last point of endurance, and then turn them adrift? That was possible; no, probable. And himself? He realised quite well that his position was at least as precarious as that of Bull and his cross-eyed partner. Standifer, in possession of the girl, guessing as he must that Norma no longer believed whatever lying tale he had told her, would have no use for him; and at some turn of the trail would try to get rid of him, perhaps—who knew?—set him adrift with the two mutineers. That was a very likely contingency, and not a pleasant one to contemplate, but Billy was behind and——

Mardock's voice sounding through the trees gave his thoughts a fresh turn. What was his attitude to himself and Standifer? That was not easy to decide! That he was not wholeheartedly with the man with whom he accompanied was clear; and his suggestion about the rifles had been of real use in helping to convince Norma of the honesty of his intentions in spite of Standifer's sowing of suspicion. Had that suggestion been made deliberately to that end; or was it a slip made in a moment of forgetfulness? He remembered the sardonic gleam that had shone in the man's pale eyes, and was sure that the suggestion had been made deliberately, possibly with the idea of irritating Standifer. He recalled Mardock's suggestion of possible friendship, and wondered what he would do in the event of active hostilities. Would he uphold Standifer, or would he let him down in order to help Norma?

He could not decide, and was still wondering when they reached the end of the portage. Mardock was a little blown, and Bull had thrown himself down upon the bank in weariness; but Standifer permitted no rest.

'Get busy, Bull—and you too, Carwyke. He handed one of the rifles to Mardock as he spoke, and then began to give particular orders as to the loading of the canoes.

(Continued on page 268.)

THE HUMMING-BIRDS OF JAMAICA.

By RUPERT A. SMITH, M.B., B.Ch.

I.

A SHORT time ago, when on a visit to Jamaica, I had an opportunity of seeing, in all their beauty, many of these living gems of bird-land, alive and free in their natural haunts.

The description of the colours of these beautiful creatures would be productive neither of information nor of amusement; but would rather excite a longing which words would be unable to satisfy. Naturalists have long endeavoured to gratify this desire by coloured prints, but the most exquisite artist is incapable of imitating the thousand beauties of the little humming-birds. If we imagine that we may obtain a complete idea of the beauty of these tiny creatures from the pictures we have seen of them, we shall find ourselves deceived when we compare these pictures with nature. The shining green, the changeable purple, the glossy red, are hues far beyond the coloured print, which is a poor substitute for painting.

The first time I saw a humming-bird I stood spell-bound. It was poised in front of a tropical flower in the beautiful Hope Gardens of Jamaica. I watched it through my glasses with admiration and wonderment. It was so tiny and yet so perfect and gorgeous. Its plumage glittered with a metallic lustre which seemed to reflect all the hues of the most precious stones—the amethyst, ruby, sapphire, topaz, and emerald.

Its body seemed to be about the size of a hazelnut, and yet it was furnished with a bill, feathers, wings, and internal organs resembling those of the largest birds. Its long tubular and protrusible tongue, forked at the tip, was thrust deep down into the cup of the flower as I watched it, and the tribute of nectar was extracted

As it hung there, as though suspended by an invisible thread, the motion of its little wings was so rapid that I could not discern their colours except by the glittering. The wind-hovering and soaring of the kestrel have always interested me and claimed my admiration, but the perfect poise of a humming-bird before a flower is, in my opinion, one of the marvels of bird-land. As I drew nearer, the hum of the rapidly vibrating wings fell upon my ears. Then it fluttered on to the next shrub, which was profusely bedecked with large peony-like yellow blossoms. There were now some six or seven of these birds hovering about the beautiful blossoms, and the humming was very distinct. Constantly in motion, yet never once lighting upon them, they visited shrub after

shrub, and kissed flower after flower, extracting the sweet nectar from each.

II.

Of all the birds that flutter in the garden or paint the landscape the humming-bird is the most delightful to look upon, and likewise the most inoffensive. Of this charming little creature there are upwards of five hundred distinct species, varying in colour, size, and other characteristics; but all possessing plumage resplendent with the most brilliant colours, resembling the flowers round which they love to sport. In some the tiny bills are straight, in others upturned or downturned—some have short bills, while in others we find bills which are longer than their bodies.

A bird not so big as the end of one's finger would probably be supposed but a creature of imagination, were it not seen in infinite numbers, as frequent as butterflies on a summer's day, flitting from flower to flower.

It cannot be conceived how much these little manakins add to the beauty of a rich and luxuriant landscape. Small though they be, they are, nevertheless, the most rapid fliers of all winged creatures.

As I watched them in the Hope Gardens I remembered that they were close relations of the swifts. Could it be possible, I thought, for how very dissimilar is their plumage! The swift is such a dull, dowdy-looking bird as far as its plumage goes, but these little jewels, sparkling and scintillating in the sun, are inexpressibly beautiful! And their nests are also wonderful in their formation. They are suspended in the air at the point of the twigs of some tropical tree, perhaps an orange, a citron, or a pomegranate tree. The female is the architect, the male finds the materials—fine moss, cotton, vegetable fibres, and cobwebs. Imagine a hen's egg cut in two, and you will have a good idea of the cup-shaped nest of the humming-bird. Two eggs are laid about the size of peas, and they are as white as snow, with here and there a yellow speck. Male and female take it in turn to sit upon the tiny caskets, and at the end of about twelve days the little ones come forth. They are about the size of a bluebottle fly. At first quite bare, they later acquire a downy covering, which is, however, soon succeeded by beautiful feathers.

I saw much of beauty and interest on that picturesque West Indian island of ours, but no sight was to me more fascinating or more beautiful than the wooing of the flowers by the little humming-birds. I expect I shall never visit Jamaica again, but my morning with these feathered gems in the Hope Gardens I shall never forget.

THE EMERALD RING.

A REMINISCENCE OF THE AUSTRALIAN BUSH.

By 'SATTAMBI.'

I.

WE were sitting on old Sam Braithwaite's veranda, the parson's son and I, on one of those evenings in early autumn when people wonder whether to put a match to the fire or not, and end up by doing so.

On this occasion the matter had already been decided by Mrs Braithwaite, for we could hear a cheerful crackle, and the pleasant fragrance peculiar to wood fires during the first few minutes of their ignition reached us through the fly-proofing of the open French window.

But it was not really cold as yet, and with the gratifying knowledge at the back of our minds that cosy arm-chairs were awaiting our pleasure by the wide brick hearth, we lingered on outside, and watched the colours change in the western sky.

As the sun sank behind the furthest ridge it left behind it an opal sea, dotted with coral islands, and bounded, so it seemed, by the golden shore of a limitless continent, whose emerald mountain-ranges stretched back and back, ever paling, until lost to our sight in the soft green-gray distances of Infinity.

Both of us, now medical students in our second year, on holiday from the City General Hospital, had been born and bred in this district. From earlier boyhood's familiarity with the wonders of the open sky we had become exacting, if not callous, on the question of sunsets, and yet there was something about the manner of its going down on this particular April evening which impelled us simultaneously to rise from our sea-grass chairs, and to lean against the lattice-supporting rail of the veranda.

So might voyagers lean over the deck-rail of an ocean liner, the better to watch the receding coast-line so rapidly fading, as a good ship heads for the open sea.

As we stood thus, we were joined by old Sam himself. Although, had his circumstances warranted its payment, Sam Braithwaite would have been long since entitled to the old age pension, he never missed 'going the roads,' as he termed it, before settling down inside for the evening.

'You've missed the best of it, Mr Braithwaite,' said I, indicating the darkening panorama; 'five minutes ago there was a real emerald patch to the right of that cloud-bank. I do wish you had been here.'

'Don't worry yourself,' he replied; 'I was watching it from the calf pen slip-rails. You don't often get such a rich green;' and then after a pause, 'It reminds me of—'

The parson's son and I, inwardly hoping that we had caught Sam in one of his reminiscent moods, looked eagerly, first at each other, and then with mute encouragement at Sam.

'Well,' he continued, 'something that happened many years ago now, within a few miles of where we are at this moment; but,' smiling, 'I hardly think it is a story likely to appeal to the present company—it's too scientific.' And then, with a twinkle in his eye, he added, 'The company, I mean—not the story. But, well, if you both give me your word never to ask me for an explanation, nor to attempt to find one for yourselves until you are back again in Melbourne, I'll risk your setting me down as a heretic.'

To this we earnestly agreed, and, forgetful alike of arm-chairs and the glowing logs within, settled ourselves down in the gathering darkness, while Sam, having provided us each with an excellent cigar, lighted one for himself, and spoke to us as follows.

II.

'This was in the days before the railway-line had been extended to Ringford on the one hand and Bembridge on the other; but then, as now, there remained the V-shaped wedge of country innocent of train-services, which, with Melbourne as its vertex, stretches its ever-widening third side across the waste-places of the Dividing Range, until it crosses the borderlands of New South Wales. Even in recent days, with the motor mail hurrying twice daily along the same route over which, at the time I am telling you of, the coach used to rumble twice weekly, our district of Easter Ranges was more or less unexplored territory to the average citizen of Melbourne. If it occurred to him—or her—to pay us a flying visit, he was more than satisfied that he had had his money's worth from the tourist bureau, when the unrivalled view burst upon him from the top of the Big Hill, as the motor paused at the summit on the return journey, in order to collect the "loose" bags at the sub-office.

'Here, with the aid of an obliging mail man, he would pick out the main features of the Marythorn mountain panorama—Mounts Query, Romeo, Saint Hubert, and Bears-cap, before the steep, winding down-grade to the railway station at Yarrathong commenced. Often enough he would come back and spend a pleasant week-end or fortnight with his family at one of the farms which used to "take boarders"—before the Heights Hotel was erected—but he seldom advertised the place on his return to civilisation, preferring to keep the knowledge of such a

hitherto unsuspected old-world paradise, as it were, in the family.

'But in the old days things were very different. The Country Roads Board had given no thought to this district, and the few owners of motor-cars had too great a respect for their springs and axles to venture more than a few miles beyond Upper Plenty bridge in the direction of Easter Ranges.

'At that time our daughter Peggie was about the same age as her son Timothy is now, rising seven years, and for six of them she and her mother had followed my fortunes from place to place. Owing to the nature of my profession we were continually on the move, visiting Sydney, Brisbane, Perth, New Zealand, and Tasmania, and seldom remaining for more than a month or six weeks at any one point.

'This arrangement, satisfactory as it was from a financial point of view, was, as you can imagine, anything but satisfactory from the viewpoint of Peggy's education and health. We realised this, fortunately in time, through the chance visit to a doctor, who advised us to give her at least a year's rest forthwith in some healthy part of the country, having mountain air. After careful inquiries we decided upon Easter Ranges, and having left my wife and Peggy ensconced in the care of a burly ranger and his kindly wife, I returned alone to the workaday life.

'During the next six months I received glowing accounts of their life in the country, and far from the dullness which I had feared they were likely to experience after the roving hotel life to which they were so used, I soon realised that both Peggy and her mother were growing daily more fascinated by their enforced rural existence.

'It happened that at the time I returned to Melbourne the owner of this property was anxious to sell, and the upshot of it all was that we decided to take the plunge for better or worse, and within a few weeks I found myself paying rates to the local shire council, with the boats of business smouldering in the background.'

III.

Sam, whose cigar had gone out, paused in his narrative. Although it was too dark to see, we could sense the smile of furtive satisfaction with which he consigned it to the nearest flower-bed, substituting for it his well-beloved briar pipe, which he drew from his coat pocket and commenced to fill. For a minute we sat in silence—that silence of the Australian Bush which is so overflowing with sound.

The sweet staccato notes of a butcher-bird rang out at regular intervals from the topmost branches of a cypress pine tree, to be answered as regularly by his mate, perched high on a feathery bamboo. A lonely mopoke away down in the gully mournfully repeated his one and only topic of conversation, 'More pork—more pork.' A dog barked in the distance, and ten

thousand crickets chirped in chorus around the dam.

Wishing not to snap the thread of Sam's thoughts by speaking, I passed him a box of matches, rattling them slightly to draw his attention. After his pipe was drawing well he handed them back.

'Sure you're not getting bored, you two? Well, then,' he continued, 'knowing nothing about farming, but determined to make up for lost time as quickly as possible, I apprenticed myself to all and sundry of the scattered farming folk who would have me—and I may say there were none who refused an extra hand gratis, no matter how unskilled that hand happened to be—for a year. During that time I got the hang of the various branches of bush and farm labour, from stripping wattle-bark and cutting and carting firewood, to the operations of seed time and harvest. At first my efforts, and in fact myself, were looked upon as a joke by the old hands who for at least two generations had wrung their living from the soil and scrub of the ranges, but I soon convinced them that I was in earnest, and they showed themselves willing to help us in any and every way possible. The ranges were becoming increasingly well known, and several cottages took in paying guests for week-ends and holidays. The mail was brought up in those days by pack-horse from Yarrathong twice weekly, but there was no regular conveyance for passengers.

'Some one suggested that I should undertake the transport of visitors from and to the railway at a specified price, and to this I willingly agreed. I already owned a strong hooded jinker, bought with the place, and furnished with an out-rigged bar for a second horse, and I was fortunate in picking up cheaply a sound but antiquated wagonette, which my two good horses, "Brandy" and "Soda," made light work of, even when drawing its full complement of "fares."

'Thus the time passed, and as the keen mountain air brought back the roses to Peggy's little cheeks, we congratulated ourselves upon our new mode of living, and wondered how we had put up so long with the old life of hurry and travel.

IV.

'We had, however, one great sorrow and regret. Three years previously we had lost sight of one of those sweet personalities which few average human beings have the fortune to meet in this life. She had been a cousin of mine, one of a large family of my mother's sister. Her parents had died when she was twenty-five years old. Her father, Tom Scarratt, had owned a large station in the western district, and she alone of her family had never married.

'Ena—you've seen her photograph on the mantelpiece inside—lived at home on the

Naitooma station, until that home was broken up by the tragic hunting accident which ended her father's successful career. She was beloved by all with whom she came in contact. She worshipped the Bush and everything connected with it, from the earliest wattle blossom to the latest lamb's tail. She rode equally well side-saddle or astride, and could have shown points to a Cobb & Co.'s driver in handling a four-in-hand team or a tandem mail-phæton.

'From boyhood and girlhood we had been the best of good pals, and when I became engaged she showed her good taste by at once falling in love with my fiancée, who gladly reciprocated her affection. In due course Ena became Peggy's godmother.

'If I came short of her good graces in any one particular, it was for the reason that, much as I enjoyed visiting her beloved Naitooma, I could not reconcile myself to going on the land permanently. I had, indeed, chosen a profession which was entirely, as the star-gazers would say, "in opposition" to the—as I then considered—cabbage-like existence of a farmer's life.

'Our hearts bled for Ena when, on the death of my aunt within twelve months of her widowhood, the home ties were severed, and the old homestead itself passed into the hands of strangers.

'Three times at least to my knowledge could Ena have had the hearts and homes of good men by the simple word "yes," but all such offers she gracefully but firmly refused. She preferred to spend her wealth of love upon her brothers and sisters and their growing families, flitting from one to another in turn, well knowing how sincere was the welcome of each, and how the younger generation eagerly ticked off the weeks which separated one of her longed-for visits from the next.

'We, of course, had no settled home in those days, but whenever my work brought us within hail of her labours of love for the time being, Ena missed no opportunity of coming to see us. She always seemed to carry about with her personality that indefinable sense of wild flowers and wide spaces which becomes a kind of second nature to those who have spent the greater portion of their lives in the Australian Bush.

'In spite of her practicality in everyday affairs, there was always a dreamy, far-away look in her eyes. She seemed to have some occult power of seeing through such obstacles as brick houses and stone walls to the wild hills and valleys of the Great Beyond.

'Although she always showed an intelligent interest in the work which I had taken up, and approved of the success which I was achieving, yet she invariably compared it unfavourably with a country life—half bantering and half in earnest—as a waste of the

gift of free will. "You will find it out some day," she would remark, by way of finalising her argument. "Perhaps by that time you will only be fit for turning out to grass—but kindly bear in mind that sooner or later we must *all* go back to the land!"

'Poor girl—she went back sooner than any of us expected, in company with many worse and few better than her devoted self. She was cruelly and suddenly attacked by the influenza fiend at a time when she herself was greatly run down, after heroically nursing back to life the wife of one of her late father's station hands.'

V.

Old Sam's voice again fell to silence, and he rose from his seat and stood for a moment staring over the veranda rail towards the Southern Cross, which was still low in the sky. The butcher-birds were also silent, but the mopoke sounded as plaintive as ever. A pair of 'possums scuttled down from the branches of the almond-tree and vanished by way of the garden fence into a clump of laurels. Sam watched them out of sight and then returned to his seat, speaking rather more hurriedly than before. 'I will not attempt to fill with mere words the gap which Ena's death left in the lives of those near and dear to her, but I will take you on to the last chapter of this yarn.

'It was a wild evening in March. The moon was in its last quarter, and heavy clouds were following each other like waves of storm troops across the sky from the south. Their ragged edges were lit up now and again by the distant flicker of lightning. For three days we had had incessant rain.

'The storm-water from the Yarra had spread over the flats, and in this district three culverts had given way under the pressure of overflowing gullies, leaving ten-foot gaps across the main road. This necessitated the immediate clearing of deviation tracks, steep and slippery as ice. They led, in places, down to and across the actual bed-level of the water-course.

'Ben Rogers could tell you how on that evening, when he and his little brother and sister were standing gazing with childish excitement at the rush of water, which fought its way through the culvert within a stone's throw of their father's cottage, the whole structure suddenly gave way with a roar, within a yard of where the awestruck children stood, carrying to its death their old sheep dog, which at the moment of collapse had been barking defiance at the swirling waters.

'On such a night, you can imagine, I was not best pleased to receive word that one of the council's road foremen, while manfully trying to clear a culvert two miles farther on,

had been struck by the falling rails from the fence upon the road above him, and had sustained injuries both external and internal.

'The message further stated that the unfortunate fellow was now being carried home, and could I get him to Dr Whitehead at Yarrathong as soon as might be, in order that if necessary the sufferer might be sent on to the hospital, three stations down the line, by the night mail train?

'I figured that there was comfortable time for this purpose, and in order to make the most of it, I harnessed "Brandy" and "Soda" to the jinker, and accompanied by poor Hallett's eldest son, a lad of sixteen or so, made the painful journey over the branch-strewn road.

'Whitehead, whose skill was first-rate at bone setting, fixed up the patient. He advised his undergoing the short train journey to Roystall hospital, and we saw Hallett and young Jim settled in an empty carriage. After receiving many assurances from old Marshall, the guard, that he would personally see the invalid carefully placed on the ambulance-stretcher at Roystall, I relieved the horses of their nosebags. I wished Whitehead good-night at his door, refusing his kind offer of supper, or even a dose of his particular tonic—which bore the Walker label—and settled myself down for the homeward journey.

'It was then about 10.45 P.M., and rain had again commenced to fall. One by one the few house lights were left behind us. My carriage lamps threw distorted shadows through the rain-blurred glasses on either side of the road, which was in places completely overhung by the swaying arms of the wind-waved peppermint trees. Here and there the snow-white trunk of a swamp gum flashed out from the gloomy shadowland like some gigantic milestone, to be merged, a few seconds later, in the universal darkness behind.

VI.

'The horses, with their heads towards home, and thinking, like as not, of the bran mash that awaited them, required no urging to keep up their steady jog as they breasted the hill.

'I recalled with satisfaction that the only culvert ahead had been lately re-established, and was therefore likely to be still in its place, and divided my time under the shelter of the hood by alternately blessing the fact that my pipe was drawing well in spite of the damp conditions around me, and telling "Brandy" and "Soda" that they certainly were the worst pair of crocks ever foaled, and asking them what they had to say about it.

'We understood each other exceptionally well, and I do not doubt that, given the power of speech, they would have returned my compliments with an equal disregard for the truth.

'Between the fourth and fifth milestones from

Yarrathong, I became aware that "Soda," always more alert than his trace-mate, was, by the poise of his head and the prick of his ears, giving me notice of something unexpected approaching. "Brandy" having been awakened to the same fact, they both began to manifest the usual horse signs suitable for such an occasion, which are to be found in even the best-regulated equine families, when doing duty on dark nights. Uttering little snorts, they pressed alternately against each other's ribs and the breeching straps. Thinking that perhaps a stray kangaroo or wallaby, fuddled by the wildness of the elements, might be crouching beside the track, as often used to happen, I gathered in the reins and told "Brandy" and "Soda" to come up to their collars. To my surprise they both replied by doing the very opposite, and showing an inclination to retrace their steps backwards to Yarrathong.

'I felt sure that some obstacle, visible to or sensed by the two horses, yet hidden from my sight by the darkness or by the sharp turning which the road takes at this point, was the cause of their behaviour.

'It was apparently quite impossible to induce them to advance one step towards the bend; nor, owing to the restive condition of their nerves, could I attempt to alight and, by walking on ahead, endeavour to elucidate the mysterious cause of this condition.

'I believed that were I to remove my attention for one moment from holding them in control, they would be past controlling.

'I touched them lightly with the whip, but the only result was that they quivered, without moving forward an inch.

'At a second stroke of the lash they made a half-hearted attempt to plunge, and at the same moment the knowledge flashed across my amazed brain that each bridle was in the firm grip of a small white, but controlling hand. Some one was holding the horses back—some one who should have been facing me between their two heads, but who was, apart from those firm hands, entirely invisible to me!

'In a dim way my senses struggled to separate the obvious reality of what was visibly happening, from the equally certain unreality of the invisible owner of those hands. At that moment there reverberated, above the bellow of the wind and rain, the groan and splintering crash of a tree falling across the road a few chains ahead.

'Even the elements seemed momentarily lulled in comparison with the death-roar of this giant. As its echoes rolled away in the distance, I found myself still gazing at the unfilled space between the horses' blinkers. Yes, the hands were still there, but now they were soothing and caressing the brown muzzles, which no longer quivered in terror.

'I seized the nearest lamp from its socket and

held it forward at arm's length. For an instant its rays reflected the green glimmer of an emerald ring—in another both ring and hands had vanished; but in that instant I *knew*.

'There is not much to add now,' continued old Sam after a slight pause, during which the chink of coffee cups inside the room reminded us how quickly the time must have slipped away.

'We were only about fifteen minutes longer than usual on the way home after all.

'There was little or no difficulty in forcing a track round the shattered branches of the fallen tree, although the road itself was entirely blocked by the huge trunk.

'The storm had passed away and stars were twinkling through the drifting clouds as we thankfully pulled into the stableyard.

'The next morning at breakfast my wife remarked that she expected to hear good news of somebody during the day, because she had experienced such a vivid dream during the night. "And," she added, "you would never guess of whom I was dreaming?"

'As I made no reply, she continued, "It was about poor Ena. She seemed to appear to me as an angel—a guardian angel—and yet, you know how absurd dreams are—she was wearing that beautiful emerald ring which your mother gave her!"

ETHNOLOGICAL TRACES IN SCOTTISH FOLKLORE.

PART II.

VI.

OF the witchcraft stories there is, naturally, a very abundant crop, and this is a branch of the subject well worth very careful investigation, for in Scotland we have probably material for the most complete classification of witch-lore of any country in Europe. The confessions of the witches preserved in the records of the Court of Justiciary give us not only the doings of the witches, but in some cases the actual witch rituals, the ceremonies and words for the invocation of the Devil, and the methods of obtaining power and knowledge; and these are for the most part native to the soil, and not derived from any foreign source. I have taken the trouble to compare some of these rituals with the Great Grimoire of Pope Honorius, and with the rituals of Continental Satanism, and am convinced that Scottish witchcraft is quite individual. Moreover, some of the witchcraft beliefs are still current.

It is sometimes said that these folklore traditions of hauntings and of witchcraft in the Lowlands are wholly lost since the spread of education and the board schools. Education has doubtless produced a certain shyness in speaking about the old-world faith, a certain pose of superiority, and the idea that it is clever not to believe; but if we can only win the confidence of the people enough to penetrate below the crust, the old beliefs and the old lore are found to be as vital as ever.

A story may be mentioned here which is very interesting in this connection, as an example of transference, being originally Scandinavian, afterwards Christianised, appearing as a charm in Orkney, and also current in Lowland Scotland. In Grimm's *Teutonic Mythology* (vol. iii.) it is told that when Balder and Wodan were riding, Balder's colt dislocated a fetlock. Wodan the wizard cured it with an incantation. The

memory of the incantation remained as a conjuring charm in Thuringia. Afterwards the same legend was told of Christ when riding into Jerusalem. In this form the spell survives to this day in Norway and Sweden for a horse's ailment. In the *New Statistical Account of Shetland* (p. 141) the same spell is mentioned, and an Orkney variant in *The Old Lore Miscellany* (vol. i., p. 400). Also in Chambers's *Fireside Stories* (Edinburgh, 1842, p. 37): 'When a person has received a sprain it is customary to apply to an individual practised in casting the "wresting thread." This is a thread spun from black wool, on which are cast nine knots, and tied round a sprained leg or arm. During the time the operator is putting the thread round the affected limb he says, but in such a tone of voice as not to be heard by the bystanders, or even by the person operated upon, the following verse:

The Lord rade	Set joint to joint
And the foal slade	Bone to bone
He lighted	And sinew to sinew
And he righted	Heal in the Holy Ghost's name.

The development of this legend is worth noting. Originally a Norse tale of the healing of a foal, it becomes a Christian charm for sprains of the human body. The whole lore relating to spells and their connection with the Mantra of the East, as preserved in the nonsense burdens of folk-songs, is most interesting, and has been very little explored.

VII.

If it were asked in what part of Scotland the ethnological traces of folklore might be studied with the greatest advantage, I think I should be inclined to put the province of Moray first, on account of the great variety of folk-tales and legends to be met with there, and the number of different races that have swept over it and left

their mark. Cave men, Neolithic men, have been there, and have left quantities of flint implements, of which a large collection is now in the Royal Scottish Museum. Fire and serpent worshippers have passed, and their trace is found in the burning of the Clavie at Burghead—possibly one of the very last remains of fire-worship in the kingdom, and still observed with due reverence on old New Year's Day. Burghead itself was a Norse colony, and is mentioned in more than one saga. Druids, too, must have been very strong at one time, judging by the number of stone circles, many of which have local traditions, either still current or recorded in old books. These mostly bear evident traces of having been originated, or garbled, by ecclesiastical editing. For the purport mostly is of heathen rites, still carried on, and of the circles being the haunt of various breeds of devils. Over the province of Moray, at an early date, the great Somerled brought an army of Celts from the Islands, claiming to be the Mormaer of Moray, and thence the Rìgh na h' Alba, or king of Scotland; many of his followers must have settled in the fertile plains, and hence, probably, the many distinctly Celtic legends which are found in the province and the Gaelic place-names. But shortly after there occurred a great deportation of the turbulent inhabitants of Moray, of whom it is said that some went south into Perthshire, where they were still called Moray men, and were the progenitors of the Murrays of Atholl, and other great Perthshire families; and others crossed the Firth and were known as Sutherlanders, or men from the south. While in their place came a Teutonic plantation, from Flanders and the Low Countries, and also, as in the case of the Leslies, from Hungary. These all probably brought their folklore and folk-traditions with them, and hence we get a distinct blend of Celtic tales in Moray, quite different from the West Highland mixture.

For the preservation of all these stories we are probably largely indebted to the ecclesiastical influences, and therefore we expect them to be coloured by Church prejudices and traditions. These, however, are usually not very difficult to dissect out.

In the witchcraft legends again Moray is

supreme. There is probably no single type of witchcraft story, no single witch ritual known, that is not well exemplified in Morayshire. The most complete account of Scottish witchcraft in any single document is the remarkable confession of Isabel Goudie, the Auldearn witch. One of the most famous of Scottish warlocks was Sir Robert Gordon of Gordonstown. The first recorded burning of witches took place at Forres, and a stone still marks the spot. The meeting of Macbeth with the weird sisters is too well known for repetition, and though the place is disputed, it was certainly in the province of Moray. The murder of King Duncan was almost certainly at Bothnagown, now Pitgaveny, on the Loch of Spynie. Probably there are witches still extant in the province. Within living memory there were several, and of the good old-fashioned type, who overlooked cattle, and prevented the cows giving their milk, and to whom the farmers paid tribute to secure immunity from their spells.

We must not dismiss the province of Moray without allusion to a strange and inexplicable piece of folklore, prevalent there and along the shores of the Moray Firth—namely, a secret society for some magical practices among farm hands, known as the 'Horseman's Word.' It is alleged that there was a traditional spell, handed down from one to another among the members, whereby the wildest horse could be tamed at once; there were weird and solemn rituals of initiation, and dire oaths of secrecy. These have been exceedingly well kept, if indeed there were anything to keep. It is said to exist still, but some who profess to belong to it assert that there is now nothing but foolery and horse-play, whatever may have once been the case. It is possible that there may have been some connection with some such spell as that which I have mentioned of Balder and Wodan, but it seems impossible to obtain any reliable information.

I hope these few rambling and rather desultory remarks may have the effect of leading some far more capable than I am to investigate this subject of folklore in connection with ethnology, and may, at all events, suggest that some clues worth following may be found in this direction.

THE END.

THE YELLOW STREAK.

CHAPTER V.

ON the Friday morning following his suspension Wells lounged into the round-house at El Chaco, and although he appeared to be perfectly sober, traces of his recent dissipation still lingered in his eyes. 'Mornin', Mr Malcolm,' he growled.

'Good-morning, Wells. Come to see about your suspension?'

'That's it. Little boss told me to show up to-day.'

'H'm. However did you manage to misread your signals at such an unlucky moment?'

'Just plain drunk,' replied the driver frankly. 'Reckon I'll be in the pan soon. What'll happen?'

'I don't know,' replied Malcolm slowly.

'Yours is the first serious case of its kind that he's been up against yet, so what he'll do is difficult to say. I've noticed that Hume never hits out when he's mad, but what he does in cold blood stands. Heard about Moore?'

'No. What's his trouble?'

'Lifting passenger fares. The day Hume arrived Moore turned up only fifteen milreis as the amount he had collected on the train, and young Jackson himself paid twenty-five under Hume's nose; so he's got to beat it.'

Wells's face went hard. 'I've got a wife and four kids to keep, and this is my last ditch; no other line would have me at a gift, so if I lose this I'm down and out.'

'That's a thing you ought to have thought about before, Wells,' remarked Malcolm, with all the petty meanness of his nature. 'I'm afraid you'll get your ticket this time.'

'By God, if I do, I'll—'

'What?' queried the assistant-superintendent. 'Starve?'

'Wells there?' inquired the telephone boy. 'Boss wants him slick.'

Hume was seated at his desk, looking as calm and unperturbed as if a three-thousand-mile journey of harassing inspection was an ordinary part of his day's work, and in cool, unhurried tones finished the letter he was dictating before he began to deal with the driver's case.

'Ah, Wells, isn't it?' he asked as the stenographer went away.

'Yes, sir.'

'How long have you been with the company, Wells?'

'Four years, sir.'

'And before that?'

'With the Canadian North-Western, sir.'

'Why did you leave them?'

'Fir—discharged, sir.'

'Why?'

'I piled up a goods-train and blocked the line for half a day.'

'Worse for drink, I suppose?'

'Yes, sir.'

'Well, my man, you have a very bad record. Last December you derailed your train and stopped the traffic for a whole day; early this year you destroyed, by your careless driving, two luggage vans with contents worth 20,000 milreis; and now, this affair at Yecco. We shall not require your services any longer. The cashier will pay you anything that may be due to you.'

'But I—you—could you give me another chance, sir?' stammered the man awkwardly. 'I've a wife and four k—children at home, and if I lose this job I'm down and out.'

'No, I'm sorry, but it is quite impossible. You have had many chances, but have apparently only gone from bad to worse.'

Wells slunk out of the office and went across

to the round-house with a tempest of rage in his heart.

'Hello, David,' said cheerful Sam Horrocks, driver of the crack passenger express, an innovation of Hume's. 'What's up now? You're looking a bit downhearted like.'

'Fired!' replied Wells laconically.

'Fired? Phew!' whistled Horrocks. 'For that affair at Yecco, I suppose?'

'That's it,' grunted Wells morosely. 'This is what comes of having a starched and ironed tailor's dummy for a boss—a guy that never had a drink in his life.'

'Now look here, David,' went on Horrocks kindly, 'you're making the biggest mistake of your life. There's some fools in this one-horse show who figure that because the boss wears biled shirts he doesn't know his job; but, take it from me, he's the hottest thing in engineers this old line's ever struck since Walton left it, and what's more, he's going to turn this old scrap-heap into a decent line before he's much older.'

'Huh, how long have you been his favourite, and what do you get out of it?' queried the disgruntled driver.

'I'm no favourite of his, my lad; he's too white a man to have favourites. But that's the worst of you drunks—you ask for trouble in large sizes; then, when you've got what's coming to you, you want to blame the other chap.' Seizing his long oil-can, Horrocks disappeared beneath his shining charge, his merry whistle echoing through the building.

The dismissal of Moore and Wells started Hume's campaign against slackness and disorder in good earnest. Train crews were supplied with a neat serviceable uniform in place of the motley collection of garments which, with the high Mexican hats favoured by most of the men, suggested the sheep ranch rather than the railway line. Strict instructions were issued to run the trains exactly to time-table. The drunken, incapable, and disloyal men were discharged, and their places filled by such members of the staff as were loyal to the new management; and the whole system was thoroughly overhauled and reorganised.

Malcolm raised a deprecating voice against this campaign of wholesale dismissal. 'You're filling the saloons with a crowd of dangerous toughs who are fit for any dirty work, Mr Hume,' he said.

'That is very probable. Still, this railway shall be run on proper lines or closed down altogether,' replied Hume with finality.

He looked up as Jack Doyle, the telegraphist, entered.

'Well, Doyle, what is it?'

'Stationmaster at Yecco wires for help. There's been a bust outside the station, and the line's blocked.'

'Get the wrecking train at once, Mr Malcolm. We will investigate.'

'Say, Mr Hume, what's the matter with the boss-mechanic?' queried Doyle, as Malcolm left the office.

'Matter?' queried Hume. 'I don't quite follow you.'

'Well, when I came in he was standing over you with a look of devilish hatred in his eyes, but it changed to his usual oily smirk in the bat of a lid when he saw me.'

Whatever Doyle's inference may have been, Hume seemed to miss it, and five minutes later left with the wrecking train for the scene of the accident.

As he surmised, Hume discovered that the smash had been far from accidental. Several yards of line had been torn up completely and others cunningly formed of mud substituted, and as this had been done on a fairly sharp curve the engine had left the track and buried itself deeply in the hillside. He superintended the removal of the engine, then hurried back to El Chaco, leaving the removal of the wrecked coaches in the capable hands of Stanley and his gang.

This accident seemed to usher in an eventful period, and for the fortnight which followed Hume slept on the settee in his office. His firm attitude towards the malcontents and his arbitrary methods of dealing with them had created much dissension, and finally led to the breaking out of violent attempts at reprisal. Train crews were removed from their engines, or severely handled if they protested against such removal; storehouses were broken into and rifled, and such as were strong enough to repel the attacks of the marauders were set on fire, with the result that many thousands of milreis of valuable goods were destroyed; and, in addition, over a mile of permanent way was torn up on the most congested section of the line.

Determined to make the line a success, Hume never spared himself; night and day, wherever his presence was needed, he would be found, persuading here, lending the assistance of his highly-trained skill there, and generally doing the work of four men. At the close of one strenuous day he had bathed and dined, and was just about to turn in, when the telephone by his bedside rang shrilly. With a gesture of annoyance he picked up the receiver.

'That you, Mr Hume?' came a well-known voice along the wire; 'this is Doyle. Operator at Corriente Dip wires that two trains have met end on at the bottom of the "Dip." It's an awful mess. I don't know how many killed, but there's certainly a lot.'

Weary to the point of mental stagnation, Hume managed to conjure up sufficient resilience to grapple with this new problem. 'Wire them help coming immediately,' he snapped. 'Order my private car round. Get Jackson at once. Tell him what has happened, and say that I want him to accompany me. Also telephone

to Para and ask them to send on their wrecking train.'

Fifteen minutes later the private car, attached to a fast light engine, slowed down at the platform erected at the bottom of Hume's garden. As he sprang aboard a shot rang out, and the bullet flattened itself out with a clang against a metal doorplate a few inches from his body.

Doyle heard the shot, and seeing a figure lurking in the shadows, he doubled back along the track, cut through the now deserted yards, and sprang out upon a masked man, who jumped back with a snarl of rage. 'Put up your hands, ye interferin' devil, or I'll plug yer hide full o' lead;' and the moonlight gleamed wickedly on the polished barrel of a heavy Colt revolver.

Doyle's mind worked quickly in this dilemma. He was fully determined to capture this miscreant after his cowardly attempt on Hume's life, but how to do it without getting shot was the problem that faced him as he obediently flung up his hands. Looking straight before him over the man's shoulder, he cried, 'Now! Grab his right hand and mind the gun!' and as his assailant turned, he shot forward like a flash, and jammed the man's hand back with a force that fractured the wrist. 'Now, let's have a look at you,' he said, snatching off the man's mask. 'The devil—David Wells! So you've added attempted murder to your many other accomplishments, eh?'

'Well,' snarled Wells sullenly, 'the dirty little swine fired me, and now my wife and kids are starving.'

'Would starve if left to the mercy of a drunken sot like you, you mean,' replied Doyle scathingly. 'Don't you know that a good sound supply of groceries goes to your house every Friday, and these Mr Hume pays for out of his own pocket? That's the sort of "dirty little swine" Mr Hume is, and you've tried to kill the man who is doing *your* duty, the man who is feeding your family.'

Wells stared at the boy with amazement written on every line of his drink-seared face. 'Boss done that?' he gasped.

'Come on,' said Doyle, not unkindly. 'Let's have that wrist put right. Then you're stopping here until Mr Hume comes back. It's the pen for you this time, my lad, and serve you darned well right, too.'

(Continued on page 263.)

THE CITY BLACKBIRD.

HE sings of glories he has never seen;
Of sights unknown; of scents and sounds afar
In the fair country of the Might-have-been
Where other blackbirds are.

And, hearing, we too leave the city gay
On his song's pinion; to us, too, it seems
We glimpse the glories of that far-away
Known but as dreams.

ETHEL TALBOT.

Chambers's Journal

SEVENTH SERIES

SINBAD'S FIRST COMMAND.

A TRUE STORY OF SEA LIFE.

I.

IN the year 1877, I, Sinbad, a mariner, had just returned from a voyage to the west coast of South America when I was offered my first command. I was then mate of a small barque in which I had served for about four years, having made three voyages as mate, and one as second mate, under a master who was considered a bit of a tartar. No officer served a second voyage with him, either before or after I was his mate.

The vessel offered to me, the brig —, was under the same management as the barque I was leaving; and the ship's husband, Captain —, owned a large share of her. Her class was about out, and she had been laid up for sale for some months past, but no sale had been effected. The ship's husband, being anxious to get her again to sea, offered the command to me, which I readily accepted; and I was as proud of becoming captain of that small brig as I could have been had the *Great Eastern* been put under my charge.

As soon as the master I was leaving heard of the proposal, he said to me, 'You're not going in that rotten craft, are you?' When I told him I was, he was so chagrined at my leaving him that he did not speak to me again while I was on board his vessel—not even to say good-bye or to wish me well.

The brig was chartered to load coal for Bahia. The ship's husband told me among other things that she leaked slightly forward when pressed into a head sea, but they had not been able to find out where the leak was. Round this leak a tale subsequently unfolded itself.

We got our cargo loaded, and shipped our crew—quite a good one. The mate, an elderly man, was a man of experience, but somewhat enervated by dissipation. He told me during the voyage that he had been in command of some of the best ships out of Liverpool, and I believed him. The cook and steward was a bright young fellow of about eighteen years of age. His father, the master of a fine west-country brig, had just married his second wife, and, I was told, as she resented the first family being in the house, they had all left home.

The steward was conversant with the practice on board small vessels, and was alert to do his part. He did the most of the boating—sailing the small boat backwards and forwards between the ship and shore—by himself; and, in the afternoon, when cargo was being worked, he took his place at the winch with the others.

On the passage out to Bahia there was a little incident that made me feel very uncomfortable. The ship's husband, having determined to squeeze every farthing possible out of the vessel before she would be condemned, supplied her with the cheapest stores he could find. The bread was of a very inferior quality—the same class being supplied for fore-castle and cabin alike. The mate would eat none of it—no matter what example I showed him. He made no complaint; just drank his tea and left the cabin table.

We reached Bahia in due course, but space does not admit of my saying anything about our stay there, however interesting, as I must hurry on to the tragic part of the voyage. I was fortunate in getting chartered for a lump sum of £200 for New York, when other vessels coming after us had to take in ballast. We made a smart run to New York; and while discharging our cargo of rosewood and coffee there, I got the vessel fixed, on a very payable freight, to load a cargo of grain in bags for Penzance.

In those days few ships came out of New York with the same hands they took in. At that time there was a lawyer there who was the talk of the seafaring community. He got two of my hands on a string, but, while he was getting an order in court to stop the ship, I slipped down the river and away. My conflict with him was interesting, but there is no space for it here, and it will keep for another occasion.

II.

The day after we sailed, the mate began to pick himself up a bit. He had had a gay time while in port—drunk in his berth for the most part, entertaining all sorts of imaginary visitants. There was a female called Nell he was continually shouting for, but whether she was an esteemed respectable friend or only a wayside companion, I never ascertained. He never came to the cabin table when in this condition;

and it was amusing to watch the curl on the steward's upper lip when he brought in the food, and to read there the opinion he had of the mate's behaviour as he gave some of his fierce yells.

The wind continued fair, and the weather fine, till we reached the Banks of Newfoundland, where we sighted an abandoned small schooner. We passed her as dusk was coming on; it was a weird sight. The crew had left her apparently in great haste, as her sails had not been taken in. She was very light, and kept coming up and breaking off from the wind over a wide arc—like some monster that was seeking for the way it had lost. We passed her close by, and hailed to see if there was any one on board, but got no response. Her hatches were off, and the wind, blowing through the rigging and into her empty hold, was making a low moaning sound.

After passing this wreck we encountered very bad weather, and our pumps were in almost constant use. A few nights afterwards, however, the weather having moderated, I turned in to snatch a little rest, when I had a strange experience; a vision or dream arose before me. There was not so much in the form of the vision as in the dreadful, wretched feeling that accompanied it. I was back in New York again, in the Exchange, where I had been chartering my vessel. I felt wet and miserable, and overwhelmed by a dreadful feeling of awe. I moved about among the crowd, but appeared invisible to those about me. Presently a female friend, of long acquaintance, came to me with a bright smile and told me to follow her and it would be all right. She led me out through a door into bright sunshine, and I awoke, bathed in perspiration and trembling all over.

Before I could recover myself the mate knocked at my door and told me there was a low cloud-bank forming in the NW., and he had taken in the topgallant-sails. I got up and dressed for the last time in that vessel. When I saw the condition on deck, I called the hands and took in the foresail and the two upper topsails; these sails were never again set. The bank of clouds in the NW. rose as it approached, and soon electric flashes were to be seen rising vertically from it. We had a hard night.

By next day the wind was round into SSE., and blowing as hard as it possibly could, curling the sea before it into wheels of foam. The weather was extremely clear overhead, where a large extent of blue sky could be seen without a cloud in it; but the low atmosphere was thickened to such an extent by the smoke blown from the sea that you could see only a few yards from the vessel. As the cargo was wet all along the ship's sides, and consequently increased in weight, I sent the hands at noon to break through the after bulkhead, and get some

cargo overboard through the cabin companion; but, before the crew got the bulkhead down, a fierce lump of water struck the vessel on the bow and crashed the bulwark in on deck.

The crew rushed up from below, the mate exclaiming, 'It's all up with her now; she's started her butt-ends.'

III.

Our only chance was to get the ship's head away from the sea before she would fill and go down. For this purpose I ordered the helm up and the mainyard to be squared; but the crew were paralysed with fear and deaf to my orders. All eyes were fixed forward. To my exhortations one of them sank on his knees, and with tears falling from his eyes exclaimed, 'Oh! look at that, sir.' And a fearful sight it was to look at, as the ship dipped her head and took in a solid wall of green water, which rolled aft, a mighty flood, bearing on its crest the broken wreckage from the bow.

I seized the wheel to get it up; I had it pretty well over, and was directing my attention to getting the after yards squared, when the vessel gave a kick and threw me over the wheel, laying me flat on the lee side of the deck. I retained my grip of the spokes, however, and the helmsman caught the wheel on the weather side; we got it hard up. I then gave my attention to getting the after yards rounded in, but the crew were rendered helpless by what they saw before them. The mate muttered something about cutting the masts away. To have cut both masts away would have sealed our doom; but my mind seized the point that, if the mainmast were over the side, the problem of getting the vessel's head away from the sea would be solved. On the spur of the moment I ordered the mainmast to be cut away.

The mate produced the axe and handed it to Johnny, a big Frenchman; but Johnny seemed to have forgotten every word of English he ever knew, and stood gazing at the mate with a dazed, inquiring look. I seized the axe from his fumbling hands, and sprang to the weather rigging. I made a cut at the after lanyard, but, whether owing to my excitement or to the motion of the ship, I struck the main-rail. I struck again, but the blow went as much too high and fell on the shroud. I paused an instant and thought to myself, 'This won't do. I was an expert at cutting sticks beside a country cottage a few years ago. I can cut that rigging, though the ship should sink while I'm doing it.' I raised the axe again, and every subsequent blow cut through one part of each lanyard, which was all that was required. As I cut the last the mast stretched itself out to leeward like a mighty giant, and went gracefully over the side. In doing so, it carried away all the braces from the fore that were attached to it, and broke the fore lower topsail-

yard in two. This was all to the good, however, as it prevented the ship running with too much speed, while the rags and spars at the fore kept her drifting easily, with the wind and sea aft.

I then went to the cabin for some empty grain bags to stop the holes forward. The steward rushed down the companion after me, exclaiming, 'The mate's sending them to cut away the foremast.' 'Stop him,' I shouted. The steward shot up the steps again, and I knew the foremast was safe. I took on deck an armful of empty grain bags, and told the mate to get the holes in the bow stopped with them. He looked forward to where the ends of the broken yards were swinging, just clear of the deck, accompanied by no end of broken ropes and blocks snapping about like so many whips, and said, 'If any one goes forward there now he'll be killed.' 'Well,' I replied, 'would it not be better for one to be killed trying to save his life than to stand shaking till the ship sinks from under him? But give them to me; I have never sent any one yet where I was afraid to go myself, and I'll not do it now!' I snatched the bags out of his hands, and proceeded forward to the damaged bow without ever looking above my head.

A dreadful sight was there to be seen: the covering boards had been torn up, leaving square holes through which a dog could have jumped down below. I began stuffing in the bags, but it took a lot of them to fill a hole. While I was busy at this the vessel dipped her head, and the backwash of the sea came in over me—the water was cold, it being the month of March. This sea washed all my spare bags away. A lump rose in my throat and my head sank in despair, when I heard a voice behind me say, 'I'm here, captain. What can I do?' On looking round I saw the steward, with all his blankets and bedding in his arms, standing by the foremast. But what a look he had on his face. He looked as if he had seen the Evil One, and all the white of his eyes was filled with blood. 'All right, steward,' I replied; 'you stand there and pass the things to me as I want them.' We soon had the holes packed full, so that the gross bulk of water was prevented from getting below when she dipped. The mate by this time had the pumps under way. He reported to me that there was over four feet of water in the hold.

IV.

I went to the cabin, locked up the grog locker, and loaded my revolver. I determined that as one man we should fight fate till it overmastered us. And, after the first shock was past, never was a master served by a more willing, energetic crew than I was. They hung on every word I said, and were prompt to carry out my slightest wish. Not only so, but

like children they seemed anxious to show their willingness to do so.

On passing the mirror, I was startled at the expression of my own face. I had just such a look as I had seen on a wild cat's face caught in a trap; and the white of my eyes, like the steward's, was filled with blood, and as red as a soldier's coat then was.

I quickly decided that pumping alone would not save us—that we should soon exhaust ourselves at the pumps, and then we should be done. So I took two hands with me, from the pumps, to get cargo out forward and raise her head. There had formerly been a lower forecabin for the crew to live in, but they were now berthed in a house on deck. The booby scuttle had been left while the bulkhead had been removed. I put the two men to drag the bags on to a hawser that was coiled under the scuttle. I got hold of the bag then by the lugs, and with a shout we hoisted it on deck. While the two men below were bringing along the next bag I ripped the one on deck open, along the side and across the bottom, dragged the empty bag from the grain, and threw it overboard. The sea coming in washed the grain off the deck.

It was a dreary night. When she gave a heavy welter—and I would look aft to see the waves and spray lashing from side to side over the heads of the men at the pumps—I fancied sometimes she was away altogether.

About midnight the steward, who had been steering, came forward and complained to me that the pumps were stopped half the time. He was followed by the mate, who wanted me to come aft and see what could be done with them.

I called all hands forward, except two men I left with the mate to draw the boxes and clear the pumps. The others I started heaving cargo overboard. We took off the fore hatch; a good deal of water went down the hatchway, but that mattered nothing while we were getting out the cargo so fast as we were.

After getting them started I went aft to look round. I found the barometer rising fast, and the wind and sea going down somewhat. Hope began to revive, and I took comfort from the foreboding in my dream that I was to be back in New York. There was another bright spot in the dark picture; I had passed through the ordeal with flying colours, and it had been the fear of my life that I might fail in my duty before overwhelming danger.

We kept on getting cargo out of the fore hatch, till the steward came forward from the helm and said that she was so low aft that the sea was beginning to break over the stern. I then stopped putting out cargo forward and sent all hands to the pumps, which had now been cleared—except the two men who had previously been with me; these I took aft and started to get cargo out by way of the cabin.

We used buckets, taking two buckets out of each bag and then dragging the bag up the companion steps. We struggled on till eight o'clock in the morning, when, as the weather had moderated, the steward got some coffee, and we all assembled in the cabin and ate whatever we could put our hands on. After a short rest we started again. We got off the after hatch, from which we discharged cargo pretty lively. A good deal of water went down, but we did not mind that. We worked on late that night, when, as the weather had moderated, and we were all completely exhausted, I served out a glass of brandy to each, and we lay down in our wet clothes—the crew lying down in the after-hold, as their house on deck was gutted out.

In the morning I awoke helpless with cramp. I called to the mate to turn the hands to. Shortly afterwards I could hear by the row he was making that he was not succeeding. I tumbled out of my bunk and crawled to the cabin door; but, when I looked into the after-hold, the sight I saw acted on me like an electric shock and brought me to my feet with all the vigour of youth. Every man Jack of the crew was as bad as I had been myself. I gave them a good stiff glass of brandy and, after some exhortation, got them on their feet. Their anxiety to please me was great, but though the spirit was willing the flesh was weak. The last to get on his feet was the big Frenchman, who was an elderly man; but, after the brandy had time to act, the others got him on deck with them. I have had more sympathy with the old fellow since I have realised how slowly the aged recuperate from muscular exhaustion.

After breakfast we took off the main hatches, and the hands turned to to get the cargo overboard. Though the facility for this was now great, the work went rather slowly through the men's exhausted condition; by midday, however, we had nearly all the 'tween deck cargo overboard.

At noon we stopped for a short interval to get some food; but our struggle was now over. As the steward came from the galley he sighted a steamer in the distance, coming to us with all speed. 'Sail ho!' he joyously shouted, and all hands rushed on deck. The steamer was soon lying by us. While the captain was making some inquiries as to whether we could use our own boat, our mate interrupted in a stentorian voice. 'Send a boat. We are sinking,' he shouted. A boat was promptly lowered from the steamer, and we were all taken on board. We were treated with great kindness and safely landed at New York. The first night we were on board the steamer it blew a gale from NW. The brig — was never seen again after we left her, and at that time she was a pitiful sight to look at.

When I arrived home I found myself in

great favour with the owners for the way I had managed everything; and a few months afterwards they gave me the command of a full-rigged iron ship, the only full-rigged ship in the company.

v.

Now for the sequel. About a twelvemonth afterwards, I was attending the fitting-out of my new ship myself—the ship's husband being absent at another vessel. I employed the foreman carpenter he had recommended for docking, &c., who was of the same name, and from the same town as himself. He and I were having a friendly chat in the cabin one day, and the conversation turned upon Captain —. After a little he abruptly remarked, 'But, man, I've done some things with him I didn't like. There's the brig —. He wanted to get her reclassified, but was not sure if she would stand it. He had ordered Lloyd's surveyor for the afternoon, but wanted to see some of the timbers in her bow before he came. So in the dinner-hour, when the workmen were away from the ship, he and I took down a lining plank. When he saw how rotten the timbers were, he just put the plank back in its place; and when the surveyor came told him they had changed their minds and were not now going to reclass the vessel. And he sent her to sea afterwards without doing anything to her.' 'And do you know,' I replied, 'it was I who went to sea in her?' On hearing this remark he closed up like a shut book.

All the actors of that drama have long since passed off the stage. Perhaps the young steward, W. Williams, may be still alive. If spared, to judge from his disposition and ability, he would probably reach a high post in the profession. Should this article come to his notice, I should be extremely pleased to learn of his welfare through the Editor.

N.B.—Though I have written the foregoing article under a fictitious name, the incidents are accurately described as they occurred.

THE GRAND PIANO.

I HAD been playing Schubert's sad 'Adieu,'
Its monotoned despair, with tears between;
Dropping in weary notes of 'might have been'—
(Alas! the music to my life was true!)

A little sad-faced child close to me drew,
And wistfully looked up; then pity keen
Pierced through my soul. His young days need
not mean
Sobblings through haunted paths of sombre yew!

I tried a merry tune—the child's face beamed—
'Is that in the piano, too?' His voice
Of wonder an accusing angel seemed,
For surely I might teach him to rejoice.

My fingers flew; of happier hours I dreamed.
Pianos hold all music! Ours the choice.

M. BUCHANAN.

THE FISHING MATCH.

By ERNEST PHILLIPS.

ALTHOUGH a fishing match is hardly as productive of thrills as a football cup tie, and though it fails to arouse the interest of a county cricket championship, the fact remains that scores of thousands, nay, hundreds of thousands, of artisan anglers look forward to the yearly fishing match as the great event of their sporting year. At first thought there seems little connection between angling and the idea of competitive matches. The general picture the word 'angler' conjures up to the mind is that of a man wading knee-deep in a shallow, rippling stream, casting his flies here and there in hope of moving some unwary trout. Who can think of competition in such a connection? Yet this is only one phase of angling. In the south, and even more so in the midlands and the industrial north, fishing suggests something totally different from the idyllic picture just limned. There the streams are not shallow, purling brooks, tinkling over beds of glistening gravel, halting for a moment in a shady pool beneath an overhanging bank, and then hurrying away to dance and sparkle over wide, barely-covered sand-beds. The fishable rivers of the greater part of England are deep, slow, sluggish streams, running almost flush with their banks, impossible to wade, and, what is more, holding few trout, but screening in their slumberous depths another race of fish altogether—the pike, the roach, the bream, the chub, the perch, the carp, the tench, and one or two others. There is little or no flicking of the fly to lure these heavier specimens from their lair. The angler sits upon his basket, or a camp stool, or even a chair borrowed from a neighbouring cottage. Instead of using a fly on the surface of the river, he baits with worm or maggot, paste or bread, wasp grub or cheese; and by the aid of a little shot of lead pinched upon his line the baited hook is carried to the bottom, where the fish prowl about in search of food. A tiny float, attached to the line, rides upon the top of the river, and the slightest movement of a fish causes it to dip, and, if the fish has swallowed the bait, even to sink out of sight with a gliding movement that puts the angler on the alert. This style of angling, calm, placid, even restful, appeals to the artisan follower of old Izaak's art. After a week in forge or factory, mill or mine, a day on the bank of such a river is a welcome break in his life; and if there be half-a-dozen of them together, what more natural than they should set out to make a match of it?

Thus the fishing match is a recognised institution. In the industrial cities of England—as, for example, Leeds, Sheffield, Birmingham,

Manchester, and dozens of others—there are hundreds of angling clubs. Some of the members are keen fishermen. They are at the waterside every week-end. They spend every holiday fishing. Others are not so enthusiastic, and the only time they go a-fishing is on the date of the annual match. Let us consider what this means. To begin with, it is all a matter of organisation. Long before Easter arrives members begin to pay weekly subscriptions. The committee arrange where the gala day shall be held—say on the Yorkshire Derwent, the Nottinghamshire Trent, or the Lincolnshire Witham. Prizes are bought, or begged, and these include food and furniture—a leg of pork, a clock, a set of fire-irons, a pair of blankets, and so forth. When a man of some prowess has been fishing in matches for twenty years his household goods owe much to his skill; for such an angler will often be a member of so many clubs that he will take part in half-a-dozen matches every season.

July and August are the favourite match months. September sees a few, and October winds up the season. It is obvious that the sedentary occupation of sitting by the waterside for four or five hours offers no attraction once October has turned. The warmer the weather the more pleased the angler—and when it is added that thousands of men take wives and children for this holiday jaunt into the fresh air and the open spaces of the country-side, it will be realised that match-fishing is, and must be, essentially a summer pastime.

We have advanced to the stage, then, where the venue of the match has been fixed. The prizes are on view in a shop-window in a city thoroughfare. Members who are behind with their subscriptions pay up arrears in order to participate. Many preparations have to be made. Officials go down to the selected spot the day before. They walk a mile or two along the river-bank. They make inquiries as to which part of the river is fishing best, and how many matches have already been held. Then they study the wind, the sunshine, and so on; and, finally, having made their choice, they measure off a piece of the bank and 'stake it out.' Each angler will fish from a numbered peg. No. 1 starts at one end, and the last number, perhaps 450, may be three miles distant. As a rule, the pegs are planted ten yards apart, but allowance has to be made for bridges, trees, weedy patches the angler would be unable to fish, and stretches near ferries or wayside cottages. I have been present at a match where the distance covered was

nearly four miles. Sometimes it is possible to avoid those extreme lengths by fishing both sides of the river, but, speaking generally, it is not often that both sides are available. If the public right-of-way runs on one side, the other is almost sure to be in the hands of private owners, and obtaining consent from all generally involves more trouble than it is worth.

So we come now to the day of the match. A special train may take us down. As we make the journey we are looking at every stream we pass, discussing colour of water, direction of wind, glare of sun, and other factors that interest anglers. At the station we turn out, and, by arrangement with the railway officials, we draw our numbers on the platform. The secretary holds open a bag. We advance one by one and take out a number. Now we know our fate—whether we have to walk a mile or three miles along the bank. Still, it doesn't matter. The exercise will do us good after the confinement of the railway carriage. So we shoulder rods and baskets and tramp away to our peg. There we sit on our basket and 'tackle up,' that is, get the rod ready. We use a very fine line, a hook almost the smallest made, and a tiny float hardly bigger than a lucifer match. Then we wait for the signal, generally a revolver shot. As it rings out we pick up our rods, swing them backwards, and three or four hundred baited hooks swish through the air and fall lightly on the water, to sink to the bottom and there commence their deadly work.

The match may last four hours. Let us walk up and down the bank and note the varying methods. Some men are ten times as keen as others. Here is one sitting as rigid as a Red Indian on the trail. His eyes are glued upon his trembling quill. He will miss no chances. His neighbour has brought wife and little son, and the three sit down together on the grass, drinking bottled milk and eating cake. He is not particular whether he catches fish or not. He is sufficiently happy to be here in the sunshine—and yet, after all, even a novice has a chance, for a fish in search of food may take *his* bait just as easily as the bait of the expert twenty or thirty yards away. Some anglers throw in great quantities of ground-bait. This is a mash made up of bran, boiled potato, bread crumbs, barley meal, or anything similar. Thrown into the water, it settles to the bottom and attracts the fish. While they are nosing about amongst it they may see the angler's bait and take it. As a rule the hook-bait is entirely different from the ground-bait. Some anglers use maggots and never vary their bait. Others will ring the changes on worm, paste, wasp grub, a bit of stewed wheat, or anything else they fancy—even to a cherry, or a bit of cheese.

Inspectors walk up and down the bank.

They have a right to examine tackle and bait to see that everything is fair. Until a few years ago they opened baskets before the men went on the river bank, and even searched their pockets, to make sure they had no illegal lures or forbidden baits with them—or even a dead fish or two, caught the day before. But this humiliating custom is now all but abandoned. The men are on their honour, and very seldom is this confidence misplaced. Still, the patrols are there. As they pass the competitors, they are asked if fish are being caught up or down the line. The man who has caught nothing may be spurred to renewed effort if he learns that Jones, a mile away, has half-a-dozen big fish; or that Thompson, near the bridge the other way, has got a bream that weighs five or six pounds. On the other hand, he may give it up as hopeless, light his pipe and throw himself on the ground, or pull his cap over his eyes and have a nap—to be awakened by somebody shouting, 'See, your float's gone.' Then he springs to his feet, dashes for his rod—but he is too late. He may have missed a fish that would have won the match.

Again the revolver shot rings out. The match is over. The men who have caught no fish are at liberty to pack up and depart. Those with fish must stay where they are till the judges come. The fish are numbered and weighed, entered in a book, and the competitor receives a counterfoil as certificate. Then all troop back to the village inn. Behind, in a locked parlour, the officials total up the catches. The secretary comes out and makes known the result—that 732 fish of a total weight of over 300 lb. have been caught; that Jones is at the top with 6 lb. 3½ oz., and so on to the end of the thirty or forty prize-winners. The president's medal for the best specimen was won with a bream of 3½ lb., and the prize for most fish has gone to a competitor with nineteen of varying sizes but indifferent weights. Nowadays, in order that the rivers may not be spoiled, the men are encouraged to keep their fish alive and return them to the water after they are weighed, and the prize for the most fish returned alive and unharmed is one eagerly coveted.

Of course, there are matches and matches. I have seen the winner have as much as 9 lb., and the lowest prize-winner over 4 lb. Sometimes the total weight may reach quarter of a ton. I remember a match where 982 fish were caught, and the winner had the amazing weight of 40 lb. On the other hand, the day may be a failure. A bitter east wind may blow, or there may be torrential rain, with thunder and lightning, and all but the very hardiest are compelled to pack up and depart for shelter. In such a case 500 competitors may have scarcely a stone of fish amongst them, and the first prize may go to a catch of two or three ounces. In one such match an angler with less

than an ounce carried off a prize of quarter of a ton of coal.

The day is over. We shoulder our rods and troop to the station, more slowly than we left it, taking it easy as we leave the dusty road and stalk in single file over the narrow and roundabout path through the corn fields. The birds are singing, the sun is still shining in the west, and the corn ripples in the breeze like a

gently-moving sea. Already the city pallor is leaving our cheek, and a healthy sunburn is taking its place. And as we board the waiting train and ride through the gathering darkness to where the distant city lights twinkle through the haze, we have no regrets at having spent the day at our annual fishing match. Even if we haven't won a prize, surely the day in the country has been all to the good.

THE YELLOW STREAK.

CHAPTER VI.

CORRIENTE DIP was a natural declivity with a very steep gradient which necessitated very careful driving. It had been the scene of many minor mishaps during the period of misrule, but none of these had resulted in the destruction which met Hume's eyes as his car slowed down at the top of the 'Dip.' Two engines, battered almost beyond recognition, lay in a heap of still smouldering débris, and around them, piled high, were the badly-telescoped carriages, with scarcely a sound board left in them.

As he stepped down from his car he was met by the white-faced and distracted-looking station-master. 'I am so glad you have come, sir,' he said, in a voice that told how heavily the accident was weighing on his mind; 'it is an awful business.'

'It is,' replied Hume curtly. 'What are the casualties?'

'Twenty-six killed, including the drivers and firemen of both trains,' said the station-master soberly, his eyes straying to the still, sheet-covered forms lining the embankment, 'and more than fifty seriously injured.'

'H'm! Write out your report, and send it up to headquarters. Also you might call the sheriff, as I intend to place the whole case in his hands. Stanley and his gang should be here any moment now from Para—here they come,' as the wrecking-train slid down the opposite slope and stopped gently within a few yards of the wreckage.

'Thunder and turf, what a mess!' ejaculated Stanley. 'How on earth did it happen?'

'Premeditated,' replied Hume. 'The couplings of the points have been deliberately sprung. See, here is the mark of the crowbar-heel on the sleeper.'

Stanley nodded his recognition of this scientific deduction as Hume continued, 'Nearly thirty people killed and about a hundred injured, fifty very seriously—it's about the last straw. Robbery and arson we can handle, but murder is a case for the law to deal with; so I have sent for the sheriff.'

'That is a very serious step, sir,' commented Stanley gravely.

'It is a terrible business altogether. However, we must push on; we have just three and a half hours to clear the track before—'

Hello! What's this?' he broke off as two men topped the 'Dip' and commenced the descent. 'Why, it is Moore, the conductor I discharged for dishonesty.'

'Yes, and somebody's got him fixed by the look of things,' said the station-master. 'Moore ain't the sort o' guy to hump around with his mitts up unless somebody's got the drop on him. Suffering shovers, it's Wells, an' he's bin through the mill, too! Hello, Wells, how long have you been totting a gun?'

'Tie this galoot up, somebody,' said Wells unsteadily. 'Found him sneaking off after forcing the couplings, and when I butted in I got a whack on the bean which laid me out. While I was doin' the bye-bye stuff he vamooseed again, but soon as I could stand I chased him. There's three of 'em in the show, sir—this is one of 'em. Now, could I have a saw-bones look at my brain-box. It's——' and he toppled over unconscious.

'Get a doctor to him at once, and see that he is well cared for,' said Hume. 'I must be going.'

Back in the office at El Chaco Hume plunged into the mass of accumulated work which kept him fully occupied for some hours; then he turned his attention to the numerous letters which awaited him. Opening one which bore the London postmark, he read a few lines, and an exclamation of annoyance burst from his lips.

'Anything wrong, Mr Hume?' queried Malcolm.

'Nothing much,' replied Hume; 'the chairman requests that we send his private car to Para. He is making a round trip of the line with a party of friends, and, as ill-luck will have it, there is all that wreckage still lying at Corriente.'

'Too bad,' replied Malcolm suavely. 'Could it not be removed?'

'There is no time now,' said Hume. 'They should leave Para to-day. However, see that everything is in good order here, will you?'

As Malcolm left the office, with a smile of satisfaction on his face, he passed Stanley coming in. The young chief of the wrecking-gang looked very tired, but appeared before his chief with a cheerful expression on his pleasant face. 'We got the line clear in time, Mr Hume, and

piled all the wreckage on the embankment. Anything fresh?' 'There is, my boy; but read the letter.'

'Oh, I say, what rotten luck! He might have stayed away for a few days longer until we had cleaned up that mess. . . . I have it! I'll get a wash and a feed, then beat it back with a new crew.'

'No, no, my boy!' remonstrated Hume, highly pleased with the young engineer's offer; 'you have already worked through one night, and must be about tired out. Leave the wreckage, and get some rest.'

'I'm not really very tired, sir. I had a good sleep coming up, and I'll get another going back. Besides, I should like to have the 'Dip' tidy before the boss hits it.'

'As you will,' replied Hume reluctantly. 'See what can be done.'

Stanley left the office with a rush, and in his headlong flight collided with Doyle just outside the door. 'Hello, Doyle,' he said blithely, with an inquiring look at the telegraphist's troubled expression; 'why this cheery optimism? Anybody dead?'

'No, not yet, Mr Stanley; but I have just met Wells, and he tells me that Moore has broken jail, and is out gunning for Mr Hume. Says he'll shoot him on sight.'

'My boy, you've been reading too many dollar shockers. This is the twentieth century, and all the bad men are dead. People are much too civilised to shoot one another nowadays;' and with a merry laugh the young engineer continued flight.

'That you, Doyle?' asked Hume, without looking up from his work. 'The chairman is taking a party round the line in his private car. Telephone all the stations to clean up, and have the chef prepare a cold luncheon for about twenty.'

'Very good, sir. Could you—er—will you see Wells, sir? He has some important news for you.'

'Wells?' queried the superintendent amazedly. 'Why, I left Wells unconscious at Corriente Dip last night.'

'He came in with Stanley's gang, sir. I don't quite understand how he got to the "Dip," because I collared him after he shot at you, and had him placed under lock and key. He must have broken out.'

'Wells shot at me? What for?'

'Because you sacked—discharged him. Now he's back to receive his punishment, and—Moore has broken jail, and is threatening vengeance.'

Hume's face paled, but his voice was calm and even when he spoke. 'Send in Wells.'

'Now, what is all this nonsense about jail-breaking that you have been filling Doyle's head with?' he rapped out, as the driver stood uneasily before him.

'It's God's truth, sir. Soon as I came round

I walked to the back of the station buildings, and heard Moore talking to a guy who had his face well covered—tall he was, and there was somethin' familiar about him, but I can't place him at all. Anyway, Moore's escaped, and they're both toting guns, and swear to get you at sight, besides levelling up with the company, which means more wrecks and other devilry. So I got Mr Stanley to bring me along to warn you.'

'In that case, Wells, you had better look out. Moore will not easily forget your interference with his nefarious designs.'

'Yes, sir, I'll watch him, an'—sir, I'm almighty sorry that I shot at ye, an' I'll take all that's comin' to me for it; an'—I thanks ye for the things ye've sent the missus.'

'Tell me how you managed to get to Corriente Dip when you did,' said Hume, brushing aside his gratitude with brusquerie.

'Heard a rumour that this show was timed for yesterday, so broke jail, bagged a flivver that was handy, and beat it by road. I got there just as Moore was doing a guy—an' you know the rest, sir.'

'Your discharge was well deserved, Wells,' said Hume quietly; 'it was not safe to allow you to drive a train in the drunken condition in which I found you.'

'I know it now, sir, but I was too fuddled at the time to see it; so I'll have to put up with the consequences.'

'There will be no consequences, Wells. You have been sufficiently punished as it is.'

This unexpected leniency was rather more than Wells could grasp, and for some moments he was too astonished to speak; then he blurted out in a voice that was not quite steady, 'Thank ye, sir—perhaps ye'd like to know that I've quit drink—for keeps.'

CHAPTER VII.

'SO, old girl, there's absolutely no hope for me at all?'

Norma Walton gazed up at the tall athletic figure of her questioner with a preoccupied look in her thoughtful blue eyes. Stalwart Terence Wingate had been her abject slave since her pigtail days, when they had romped together on her father's lawn, and now, for about the hundredth time, he had asked her to marry him, only to meet with the same discouraging glance.

They were alone on the observation platform of the chairman's private car, and, as her eyes wandered over the riot of semi-tropical foliage that lined the banks through which they were hastening towards El Chaco, she mentally contrasted him with a lithe, clean-limbed figure whose image had taken possession of her thoughts when Leighton had spoken his name in her presence some weeks before; and many happy incidents in her all-too-short engagement flashed across her mind.

'Not a scrap, Terry,' she replied at length, with the comradely directness of the modern girl. 'You are a top-hole sport, and I like you ever so much, but I could not marry you.'

'You are sure, Norma?'

'Quite, quite sure, old man. Do understand, and let us remain good friends.'

'But tell me,' he persisted gently, taking the hand she had outstretched towards him to soften the blow; 'is there anybody else?'

'No,' she replied slowly; 'there is nobody else, now.'

'Then I shall not give up hope. I shall——' and he broke off suddenly as Walton walked out on the platform with Leighton at his heels, just as the train topped the rise of Corriente Dip and commenced to descend the slope steadily.

'Hello, what's this?' asked Walton, eyeing the pile of wreckage at which Stanley and his gang were still working feverishly. 'Have we so much rolling-stock that we can afford to smash some of it up periodically?'

'It looks uncommonly like an accident,' remarked Leighton; 'or, if all reports are true, a vigorous protest against the new management.'

Some hours later the car slowed down at the platform of 'Eagle's Nest,' where Hume was awaiting them; and almost before it had stopped Leighton was on the platform shaking Hume's hand heartily. 'Well, Kent, old fellow, how are things looking?'

'Pretty well, thanks, Jasper,' replied Hume, returning his friend's handclasp with interest. 'I have had some trouble, of course, but I think I am now master of the whole situation.'

'Splendid! Now, come inside and meet the chairman.'

Inside the car Hume engrossed Walton for some time with a brief but comprehensive survey of his administration, which aroused his deepest interest. There was something in the modest air of self-possession this subordinate showed; something in the splendid grasp and fearless handling of a very difficult task, and in his weirdly uncanny knowledge of mechanics, which commanded the respect of even such an expert as Walton.

In the midst of their conversation the door opened, and a lovely girlish face, all aglow with health and happiness, appeared round its edge. 'Daddy, do leave that horrid business, and come to lunch. You—— Oh, I beg your pardon; and as she caught sight of her father's companion she turned to flee.

'Come here, Norma,' said Walton; 'I want you to meet our new superintendent. Mr Hume——my daughter.'

Although Norma had planned the trip solely for this meeting, and had been schooling herself in her mode of conduct towards it all the way from England, it finally caught her unprepared. She had pictured a far different event from this chance meeting; an occasion where she would

be calm, cool, collected, and entirely mistress of the situation. Now, as Hume turned, and recognition flashed into her eyes, all her carefully laid plans melted away, and she half-gasped out: 'Ke—— How do you do, Mr Hume?'

Hume kept himself well in hand, courteously acknowledging the introduction with a few well-chosen words; but as they left him, and climbed the hillside to where the luncheon was laid out, picnic fashion, he stood gazing into space, his mind a riot of conflicting emotions.

Finally he shook off this unusual lethargy, conjured up by the sight of the woman he had lost, and walked briskly down the line to his office, where much work still remained to be done. As he passed through the general office he noticed, even in his preoccupied state, that there was an unwonted air of stillness pervading the place. Attaching no importance to this unusual state of affairs, however, he went into his private office. No sooner had he entered than he was seized from behind, and held in a powerful grip which rendered him momentarily helpless. Then, shaken from his apathy by the suddenness of the attack, he bent down and threw his captor forward over his shoulder with a deft heave which stunned him, and turned to meet the attack of two other miscreants. He fought desperately. Twice he had a deadly wrestler's grip, which would have finished his man but for the intervention of his confederate; but the odds were too heavy for him, and he was finally overpowered and tied securely in his chair.

Whilst his captors rested after their struggle, Doyle rushed in. 'Mr Hume,' he began, 'the chairman wants——' Then, taking the situation in at a glance, he quick-wittedly made for the window, only to be felled by a blow from the butt of the nearest man's pistol.

(Continued on page 277.)

THE NOMAD.

I SHUN the city's stifling walls
To wander forth 'tween sea and sea;
The wild woods are my palace halls,
My kingdom daily calls to me.

I run a race with fleeting time,
By lonely copse and spreading wold,
And see at every morning's prime
Earth's wondrous miracle unfold.

Love comes to me in lowly guise
And fills my dwelling like a sun;
My empire shineth from her eyes,
With earth's proud monarchs I am one.

I journey to the great unknown,
For me life hath not any bars;
The winds and waters are my own,
Mine is a kinship with the stars.

Apart from all your stormy creeds,
By dale and down my ways I take,
And God supplies my simple needs
From His full store, for Jesus' sake.

ALEXANDER MCLEISH.

THE MIDDLE-CLASS BABY'S HANDICAP.

By Dr MARION MACKENZIE.

ONE'S experience of babies, when a medical student, was entirely with the sick baby who has already been damaged, usually by bad management. To prevent such damage was never taught. Even attendance at 'Sick Kids'—as we colloquially called the Children's Hospital—was not compulsory. Many medical students have not the luck to have a 'Sick Kids' where they can attend if they choose, but become fully-fledged doctors before they realise that the treatment of babies is not quite so simple as to enable them to deal with them as immature adults. True, there was a formula by which the dose of a drug could be made to fit a baby by some abstruse mathematical calculation; but either one's mathematics were at fault, or the baby had an inconvenient way of resenting such treatment. Sometimes he would tolerate a drug in a way which was out of all proportion to his size; perhaps, on the other hand, he would almost 'walk out' on a dose which should have suited him admirably. Such a simple thing as castor-oil given too early in life would annoyingly upset his digestion for the rest of his days. So it became the fashion to 'leave it to the nurse,' and then, when the baby became ill enough to deserve our attention, we resorted with a sigh of relief to the inevitable bottle of medicine, which had the advantage of being somewhat of a mystery, and at any rate made us feel we were doing something. In our salad days we had diets for infants of different months framed and hung in our consulting-rooms. But, alas! the babies were not machines, and refused to tolerate being treated as such. True, if we were lucky—and there are some babies who will stand anything—we came across a baby who would thrive on a standard diet, but they are so few as to be negligible.

Then we thought we had got the right thing at last, a standard not of age, but of weight; and by dint of more mathematical brain strain, and by taking the weight of a baby and multiplying it by so much food per pound of weight, the right standard was arrived at. But, alas! if the baby was of a genial, placid turn of mind, and gained weight rapidly, you found the increase of food required to be so alarmingly large that you feared an explosion was inevitable! And you proceeded to curse the system, or want of a system, which omitted to put you wise on these matters, and left you to learn in the hard school of experience after you had been licensed to kill, instead of before. True, we had been taught to recognise the physical signs of bronchitis, for example, and its treatment, but no one taught us how to prevent it in babies.

However, we might bear it with equanimity

till it came to our own babies' turn. Then it was a different matter, and one's indignation was great that the teaching of the treatment of the normal baby should be left so much to chance. In the case of the writer's first baby, in spite of the fact that both parents were doctors, the baby bade fair to depart this life, as nothing seemed to suit him, till we wrote to ask the advice of one of the doctors at the Infant Welfare Centre at Huddersfield. The baby never looked back, and from a fretful, crying child became happy and healthy.

Huddersfield at the time had reduced its infant mortality to less than half what it had been previously. Dr Moore, their Medical Officer of Health, had been inspired by the success of a French town, Villiers le Duc, whose infant mortality, previously about 200 per 1000 born, had been brought towards vanishing-point by the efforts of a mayor who was also a doctor. The then Mayor of Huddersfield, Mr Broadbent, at the instigation of Dr Moore, took an active interest in the Huddersfield babies, with the above result.

Now what can be done for workers in industrial areas can more certainly be done among the middle-class. It is a crying shame that only the babies of the poorer classes should be helped, when help is often so much needed by the better-class mother. In 1922 in Leeds, in an industrial part of the city, the infant death-rate was 300 out of every 1000 babies born—that is to say, almost one-third of the babies died who did not attend the Welfare Centre; but of those who attended, only 76 per 1000 died. In other words, they had as good a chance of life as the middle-class baby not attending a Centre, in spite of overcrowding, filth, lack of air and sunshine, and all the hundred and one things which militate against a baby's chance of life. It must be remembered that these statistics include the indifferent mothers, who simply come for what they can cadge, and probably only attend a few times. Imagine what could be done with the more fortunately placed mother with leisure to carry out directions.

Every baby who is artificially fed should be under medical care, and most babies fed naturally are the better for it. This is where the poorer mother scores. In towns, at any rate, she has always the benefit of a trained health visitor's advice, and can take her baby to infant clinics, if she cares to. There the baby is weighed weekly, and seen by the doctor every week if necessary, sometimes several times a week, even every day at times, but at least once a month. Any mother may go if she chooses.

It is not enough to *think* your baby is doing well, but to make sure. Weight is not everything, but it is a very good indication of progress, and unless a baby is gaining steadily, neither too much nor too little, there is usually something wrong. Even the baby fed naturally needs supervision, especially when the time for solid food arrives. One of the greatest benefits an infant clinic can and does bestow is the prevention of artificial feeding before the normal time, and then the giving of the right sort of diet. In many cases where the baby has been on a bottle for as long as a couple of months, it may be safely got back on to natural feeding. Recently a mother brought a baby to me who had been put on to a bottle and, fortunately, was even more ill on it than when previously nursed by her. I pointed out the risks of bottle-feeding, and showed her that her failure was due entirely to over-feeding (every two hours), not, as she thought, to her having insufficient milk or to its disagreeing. It took me just over half-an-hour to examine her baby, get its history, habits, &c., and instruct the mother; but that half-hour may mean a healthy citizen, instead of, conceivably, a dead baby or a chronic dyspeptic.

By means of test feeds—that is, weighing the baby before and after a feed—we were able to assure her that she had sufficient, with the result that though the infant had been on a bottle some weeks, it is now a peaceful, happy baby on four-hourly feeds, allowing the household to sleep in peace. The mother told us naively that she never dreamt that *she* could come to such a place as an Infant Welfare Centre.

Why *should* middle-class babies run so much graver risks than the poorer ones? That they do is obvious from the statistics in a mixed district, where it has become the fashion for the better-class mothers to attend the clinics. Of the babies not attending, the infant death-rate is 110 per 1000—fairly low for an industrial town; but of those babies who attend, only 27 per 1000 die. In this district there is no doubt that the kindly co-operation of one of the leading doctors is a help, as he always advises the mothers to bring their babies to us. One of my first cases sent by him was a small mite weighing about 3½ lb., whom he sent with the assurance that if anything could be done we should do it. We worked hard, and eventually, after despairing several times, we got another mother to give of her abundance an occasional feed. The baby slept six hours the first time, and never really looked back. Dr Truby King got some marvellous results in his efforts to ensure successful feeding. In one case, a mother, being unable to nurse her own baby, was enabled not only to do so, but to help altogether about twenty other infants. Dr

King came over from New Zealand during the War in order to help the 'Babies of the Empire.' Previously a mental specialist, he came to the conclusion that he would do better work by beginning with the babies and their mothers, and getting thus a sound mind in a healthy body. In spite of its hot summers, New Zealand had at one time, and, so far as I know, has now, the lowest infant death-rate in the world, after previously having about the highest. What New Zealand has done, we can do; but it is up to us to see that it is not only the derelicts of society that are saved to propagate the race. The child is the father of the man, but the baby is as certainly the grandfather. The great middle-class threatens to be squeezed out of existence by the high price of living, the shortage of houses, &c. Their families tend to become smaller. At any rate let us conserve what we have got. Surely the middle-class baby is as well worth saving as his poorer brothers, and Infant Welfare Centres should be started for the middle-class mothers and babies, where they would have the advice of a trained staff. The objection is raised that we are taking away work from the general medical practitioners. Speaking as a general practitioner of ten years' standing, I hold this to be untrue, except in the sense that we keep the children from getting ill in a great many cases when they otherwise would. It is much more dramatic to do a big surgical operation than it is to prevent the necessity for it ever arising. One can conceive a Utopia in which doctors and dentists will no longer exist, much less surgeons.

In general practice, mothers will not bring their babies to us as a rule till there is something wrong. Now the aim of pediatrics is to keep the healthy baby healthy, not to treat the diseased baby. Take such an apparently simple thing as sickness. In an infant usually it is amenable to treatment, if seen early and treated seriously directly it occurs. But let it go on and it becomes most intractable. I have in my care at present a baby of seven months, who has been sick since birth, and only now brought to the Welfare Centre. She was getting thinner and thinner, and in despair the mother brought her to us. Certainly the sickness has stopped in the meantime, but her chances of really making good are remote.* Had she been under the Infant Welfare Centre from birth, the trouble would in all probability never have arisen. In her case the mother was a better-class woman, who would not have come had she not been desperate. Yet it should be a *sine quâ non* that the 'nation's babies' should have the same right, whether rich or poor, to benefit by the Centres. In many

* Since this was written the baby has come on far beyond my expectation. From a whining, practically dying baby she has become rosy-cheeked and jolly, and quite plump.

Centres this is the case, but there are still others where the better-class mother is looked at askance. One journalist whom I know personally told me the doctor at the Centre said she could afford to go to a private practitioner. If every mother were to do so with healthy babies, he would have little time for anything else! And it's the healthy babies we want—to keep them so.

Though there is no doubt that infant welfare is still in its infancy, and that there is much to learn, at any rate it begins at the root, which is a step in the right direction. We found many of our conscripts were C3 men, and traced their ill-health back to childhood; then it was found that children were already defective when entering schools. Hence began a big campaign to start with the babies, which had already been initiated by people of vision, mostly lay women who were baby lovers and appalled by the unnecessary deaths and suffering. It was given a great impetus by the War; Lord Long said it was the best war-work women could do. Men saw that if we were to survive as a nation, we must have healthy babies, but the mistake was that only the poorer babies were catered for.

At the moment it is only the middle-class

mother with a fair amount of 'nerve' who brings her baby regularly to the Centre. There is an impression that they are only for the poor. This impression is not confined to the mothers themselves, but many doctors will say the same, and resent it if their patients attend. Even our own staff are known to say, 'I should think they could afford to go to their own doctor,' which shows how little they appreciate the spirit of the work, and makes me think with gratitude of the Centre that came to our rescue.

Just as surely as Mother Shipton's prophecy that men would fly like birds has come true, so will preventive medicine in time wipe out most of the diseases of the earth. But if the middle-class is to survive, it is up to us to see that there are Infant Welfare Centres in middle-class districts—it is up to the middle-class mother to see that she takes advantage of them. It is a disgrace that middle-class infants' death-rate should be *no lower* than that of the slum babies attending a Centre. Antenatal work should also be a *sine quâ non*—for the safety of mothers and babies.

'The race marches forward on the feet of little children.'

A GIPSY OF THE NORTH.

CHAPTER XII.—*continued.*

TWENTY minutes later they were afloat again, and this time Norma was in the second canoe with her captor and his friend, whilst Carwyke went ahead with the two mutineers. Scarcely were they well afloat, when the cross-eyed one jerked a question. 'Say, where d'ye come in on this durned trip? Are yo' with Standifer or not?'

Carwyke considered the question swiftly, and then answered truthfully: 'Against him!'

'An' yo're prepared to dish him?'

'Yes, at the right time.'

'That's any time now! If we don't get him now he'll play one of his infernal tricks, an' leave us ter live on roots an' berries an' such truck till we turn up our toes. There ain't an ounce o' food in this canoe.'

'Is that so?' asked Carwyke quickly.

'That is so! An' I guess it sorta shows Standifer's hand. He's going ter dish us, or cast us away in these blame woods ter starve. But if we last out ter the next camping-place, I guess we might put the boot on the other leg. I'd like fine ter see the black devil standin' on the bank without an ounce of grub, an' me dancing by in a canoe with a gun in my hand. I reckon there wouldn't be no Mr Standifer for more than two minutes. I'd blow him ter smithereens! Are yo' game, Mister Carwyke? Will yo' stand partners wi' Bull an' me?'

'Well,' replied Carwyke slowly, 'that depends. There's Miss Mannering to be considered——'

'No, there ain't!' broke in Bull. 'That's where ye makes the mistake. The girl's our loot, an' don't ye get thinkin' she ain't.'

'Then I'm afraid——'

'Blazes, man!' Bull interrupted, 'ye don't think we're goin' ter make ye a present of the girl whilst we help to save yo'r life! That ain't business.'

'In that case, I don't stand in!'

'Then stand out, an' be hanged to ye! I guess Tick an' me'll manage the business on our own; an' when we've got the girl again, I reckon ye'll be wishing you'd gone shares. But some fools is blinder nor a bat!'

The man relapsed into silence; and wondering what desperate scheme the precious pair were considering, Carwyke paddled on until, some two hours later, Standifer called a halt and gave orders to make a camp.

'We're out of range of Nicky now,' he laughed, as Carwyke stepped out of the canoe; 'and I'm 'most tired as a dog.'

Judging from their looks, all of them were the same. A small fire having been lit, a light meal was cooked and eaten, and with Standifer himself mounting guard, the rest of the party lay down to rest. Carwyke fell asleep almost

instantly, and a minute afterwards, as it seemed to him, though it was a good four hours later, was awakened by the sound of a rifle-shot, which was immediately replied to by a rifle fired in the precincts of the camp.

Without rising to his feet he looked round. Marlock and Standifer, rifles in hand, were standing each against a tree, looking into the depths of the wood behind the camp.

'Where did the shot come from?' he heard Standifer ask.

'From the northward, so far as I could judge,' replied Mardock.

Smiling a little as he looked at the two tense faces, Carwyke rolled over and crept towards Norma on hands and knees. 'Better lie still, Miss Norma, or creep under that big pine there.'

The girl looked at him with eyes that betrayed her excitement, and her lips shaped a question without sound. 'Billy?'

He nodded in reply, watched her creep to the shelter he had indicated, and himself lay down among the roots of another tree; then in deep silence the whole party waited. There was no wind, and except for the ripple of the water, no sound broke the intense stillness. Five minutes passed; minutes that tried the nerves of the watchers sorely; for when the deep silence was broken by the hoot of an owl, somewhere in the depths of the wood, Mardock fairly jumped, and Standifer let slip an oath.

Nothing followed for quite another five minutes, and at the end of that time the man Tick shambled to his feet. 'The beggar's vamoosed,' he said. 'An' I guess——'

What he guessed they never knew, for at that precise moment a rifle cracked from a different point of the compass from that in which the watchers were staring so intensely, and the cross-eyed one crashed to the ground, kicked convulsively once or twice, and lay still.

'Gawd! He's got Tick!'

Scarcely had the words passed Bull's lips when Standifer fired. The sound of the shot was still reverberating among the trees, when from the woods again there came the hooting as of an owl, with something derisive in its quality.

'That ain't no blamed fowl!' commented Bull; 'an' I reckon that shot was a miss.'

In spite of the grimness of the situation a half-smile came on Carwyke's face, and he heard Mardock ask whisperingly, 'Did you see the fellow, Kit?'

'Saw something move, and fired at it,' was the reply. Still they waited. More minutes passed without anything happening, then suddenly Standifer turned round. 'Carwyke,' he said, 'load the canoes.'

'Heavens, Kit,' cried Mardock, in swift protest, 'it's plain murder to order——'

'Shut up!' interrupted Standifer sharply. 'Do as I tell you, Carwyke, or I'll shoot you out of hand.'

Half-guessing what was in the man's mind, and very certain that in case he disobeyed Standifer he would fulfil his threat, Roy Carwyke rose to his feet and moved slowly into the open, keeping his face turned towards the wood. If Billy made a mistake—— He shivered at the thought, and was conscious that Standifer was watching him curiously; whilst Norma's face wore a white, tense look of apprehension.

Nothing happened as he moved farther into the open, past the lifeless body of Tick sprawling on the pine-needles. The wood remained silent as the grave; and as he began to fulfil Standifer's order and load the canoes, the stillness behind was unbroken. Then Bull gave a hoarse whisper of relief. 'Ther feller's quit sure this time!'

Standifer still watched the woods, and now an enigmatic smile played on his face. From time to time he turned round and noted the progress of Carwyke's work, and as it proceeded the man Bull, sitting up at the foot of his tree, began to stuff a pipe with plug-tobacco, bitten off with his teeth and rubbed up between his hands. Standifer eyed him sardonically for a moment, then asked, 'Think the sniper's gone, Bull?'

'Dead sure of it,' answered the man, with a laugh. 'If he hev'n't, why don't he shoot Carwyke?'

Standifer gave an odd laugh. 'Light your pipe, Bull, and then turn to and help with the canoes.'

Bull lit his pipe in a leisurely manner, nonchalantly rose to his feet, and moved into the open. Scarcely had he done so when once more the rifle of the unseen marksman in the wood cracked, quite close as it seemed, and with a howl Bull dropped to the ground and rolled over and over towards his tree.

'Heavens! I knew it!' cried Standifer sharply.

'Knew what?' asked Mardock.

'It's not the big Russian who is following us. It's that d——d Eskimo squaw-man!'

'But how——'

'The beggar doesn't shoot at Carwyke, but he potted Tick and tried for Bull. If you or I stepped into the open he'd try to bag us. It is as plain as print. To the Russian we should all be the same, but that fellow out there discriminates. Well'—he laughed sharply as he spoke—'we shall be able to scotch his shooting when we're ready for moving!' He looked round at Bull making himself a small figure at the foot of his tree. 'Were you hit, Bull?'

'Tip o' my ear. That——' The man broke into a torrent of vile vituperation; and glancing

round, Carwyke saw that indeed the tip of the man's ear was shorn away as neatly as if a pair of shears had been used.

Standifer laughed harshly. 'Be a lesson to you to be true to the salt you eat. If you try any tricks or break away, that fellow will get you as if you were a rabbit.'

'If I'd a gun——'

'You haven't; and you're not going to have one, Bull. But you're going to work as you never worked in all your lazy life, to get us out of range of that fellow——' He laughed again recklessly, and then turned once more to the now silent woods.

'How are you going to get away, Standifer, without being potted?' asked Mardock curiously.

'You'll see, as soon as Carwyke has the canoes ready,' was the reply.

More minutes passed slowly without any sign from the watcher in the wood. Somewhere quite close a porcupine began its peevish chatter, and once there was the cry of a loon out on the water. Seeing the canoes were now ready, Standifer gave a sharp order. 'Stand back

a couple of yards, Carwyke.' Because there was nothing else that he could do, the prospector obeyed; then Standifer spoke again. 'Now, Miss Mannering, stand by Mr Carwyke, a yard or so to the right of him.'

The girl followed the instructions, and as she took her place, the man spoke again. 'I'll go first, Mardock; keep one eye on the woods and one on Carwyke. He might find the position too tempting.'

Standifer dropped on his knees and crawled between the pair to the second canoe, and then called to the mutineer, 'You now, Bull! You needn't fear for your ears.'

Bull crawled down the slope in remarkably short time, and on his leader's word Mardock followed. 'Now, Miss Mannering,' said Standifer, with mock politeness. 'Please take a seat. And you, Carwyke, will share the canoe with Bull.'

Two minutes later they were afloat; and as they moved off, Carwyke and Bull in the leading canoe, Standifer gave a harsh laugh of triumph. 'Scotched!'

(Continued on page 282.)

WHY COTTON IS SO DEAR.

By ALFRED S. MOORE, Author of *Linen from Field to Counter*, &c.

I.

IT is an economic fact, well understood, that cotton and linen are complementary commodities. The two textiles fulfil similar purposes in the clothing and decoration of humanity, and are, to a considerable extent, interchangeable. So long as the margin between the respective prices of these sister textiles is not very great, linen can maintain its preference; but when the margin expands there is a strong tendency for the thrifty housewife to choose the cotton article. Her argument is that, while the cotton may not be quite so satisfactory, still she may purchase three new articles of cotton for the same price as two of the flaxen fabric. It is the quantity factor which dominates.

To-day the relation between the sister textiles is high as abnormal as it was during the mid-sixties of last century, when the blockade of the American Confederate ports prevented cotton from being exported to Lancashire, and the great mass of British people willy-nilly had to buy linen. So abnormal are present conditions that, as regards the raw materials, cotton is actually dearer than flax. Thus, as against 6½d. per pound average in 1913, raw cotton has soared till it is quoted around 19½d., representing a rise of 200 per cent. Correspondingly, average Irish flax, procurable at about 7d. in the pre-war years, is now offered at only 12½d. per pound. In yarns the disparity is even more

marked, for while spun linen yarn is being sold at between 17d. and 18d. per pound, competing qualities in spun cotton are being offered at 26½d. per pound. This means that it is actually possible to-day to purchase some linen cloths cheaper than corresponding cotton fabrics.

II.

Why, then, is cotton so dear?

Fundamentally it is the operation of the old economic principle of the effects of supply and demand.

Linen may be the fabric of quality, but cotton assuredly is the textile of quantity. It is universally used both for dress and decorative (that is, furnishing) purposes. To imagine a world without cotton is to imagine a day without sunlight. It is indispensable to man and woman, to rich and poor, to white and black. It is possible that people could dispense somewhat with cotton furnishings in their households, but to think of them reverting to Adam and Eve standards in their personal garb is too utterly impossible.

After food, humanity's primal necessity is clothing. Cotton is the fluffy cradle clothes covering the cotton plant's seed. This seed is secreted in its capsule called 'the boll'; and as it ripens Nature prepares further covering in this fluffy mass of fibres, which we know and use as 'cotton wool.' Nature has many methods whereby seeds of plants migrate to suitable soil

for their further evolution. We know how the dandelion adapts its parachute attachment; so, similarly, the wool serves here to carry the embryo cotton where the wind listeth. Of course, it is an exotic plant, but during August, on many of our British bogs and heaths, we can see this cotton—a wild variety—flourishing.

He was surely a prehistoric genius who, in the azure blue of long bygone eons, first impressed this tiny vegetable product for the service of man. Indeed, what humanity does is to strip the boll of its fluffy wool and, making from it thread, further fabricate the thread into calico or some other of the myriad cotton cloths. Small things make the world's progress, and give happiness or pain to multi-millions of its people. On this gossamer little wool fluff of the cotton myriads of people in the world depend for body covering.

It is impossible to visualise exactly what a gargantuan bulk of cotton is essential for this manifold necessity. Albeit, cotton statistics are marvellously organised; and it is computed that the world's total cotton production, which was over 25 million bales (each of 500 lb. approximately) in pre-war times, is now around 20 million bales only. Of this mighty bulk, the United States is responsible for $11\frac{1}{4}$ millions, India for about $4\frac{1}{2}$ millions, China for $1\frac{1}{2}$ million, Egypt for $1\frac{1}{4}$ million, and the rest of the world for the remainder.

But cotton, as well as being a variable crop, is not homogeneous. Its length of fibre varies, and indicates its use. So we have three main grades of fibres, described as fine, medium, and short staple cotton respectively. The shorter fibres, less than $\frac{3}{4}$ inch long, are mainly spun and woven abroad into coarse cloths, or mixed with other fibres. At the other extreme are the fine cotton fibres, ranging from $1\frac{1}{4}$ inch long to 2 inches, and these, the aristocrats of the cotton family, are much esteemed for making the superior finish cloths upon which Lancashire and America pride themselves.

The third class, the medium-grade fibres, come, as the designation signifies, between fine and shorts. American medium is indeed the leading cotton of all as regards its bulk. As much as 11 million bales of its total of $12\frac{1}{2}$ millions comes from the southern regions of the United States. Lancashire alone during an average year would spin and weave over 4 million bales of this American medium, and this bulk is a goodly proportion of the total American production, isn't it? At any rate, we see that what improves or injures the American crop must intimately affect the welfare of Lancashire's teeming millions of people, as well as affecting even the ubiquitous man in the street through his pocket.

There is no country in the globe approaching the United States as a cotton producer. There cotton is king, the leading commercial crop over

all others. You could drop half-a-dozen areas as large as England, Scotland, or Ireland among the mighty white blossom tracts of the American cotton belt, and never miss them. Profits for over two million farms, labour for four million people—that is what King Cotton means for agricultural America. The fibre raised here is all long cotton, and probably five million people in Lancashire depend entirely on it for their livelihood. Alas, it has now become a serious problem how much cotton can be produced in America at all.

III.

Our Northern Ireland farmers tell us that flax is a mighty risky crop, but it is almost a gilt-edged security compared with cotton growing. Good seasons and bad seasons hunt each other in a ring. First a crop that breaks all records; next a fall in prices; smaller acreage the year after, because many of the growers, being small scale men, have not enough capital to breast the storm; a smaller crop consequently; then prices up again to the apogee like the noon sun. So cotton production under various influences has dwindled tremendously during recent years. Thus against a crop of almost 17 million bales for 1914-15, the 1921-22 yield was only $8\frac{1}{2}$ million bales. For 1922-23 it was $10\frac{1}{4}$ million bales, and now for 1923-24 it is a little over 10 million bales.

A host of causes, active and psychological, may be adduced for this decadence. Weather plays its part. Labour is a potent factor, for the negroes are fast deserting the cotton fields for New York and city life. The migration has become a stampede. From Georgia alone 80,000 negroes have cleared during the past year. For the first time in many a day the white population of South Carolina outnumber the 'cullud folks.' Cabin after cabin deserted, acre upon acre of rich, fertile farm land untilled, weeds and wild flowers vegetating in wanton luxuriance where once King Cotton reigned as mighty monarch! One may travel miles with only abandoned plantations to command attention, and not a human being to ruffle the oppressive silence save the occasional welcome approach of a stray traveller. Is it any wonder that many of the planters, beaten so repeatedly to the ropes by adversity, have ceased growing cotton or diverted into other crops? Indeed, the fate which has driven them into other cultivations is reckoned a godsend in some States.

Mighty as has been the working of weather and labour against the cotton planter, his worst enemy—modest, yet implacable—is a mite, just as big as a lucifer head and just as red. He makes cotton crops small and cotton prices big, and defies man to thwart him. Just a little bug, but he contests man's right to deprive the cotton seed of its swaddling clothes—and wins. Both seed and fibre fall under his ravages, for what

is not consumed is ruined. Cotton prices have a human enemy in the 'future' dealers, fiends who by gambling can deprive even the needy of shirts by artificially raising prices, but these human harpies are merciful compared with the blackmail of the cotton boll weevil in elevating cotton prices sky-high.

The maternal boll weevil comes along and seeks a promising boll for the deposit of her egg. The best boll is selected, because later on it must habit the juicy white grub which gnaws away to its heart's content at both seed and cotton wool. What can the cotton grower do to evict the tribe? He ploughs his land, sows his seed, keeps away weeds, pays his rates and high labour costs—only to discover that he would have been as wise to have gone down to Atlantic beach and flung all his money into the ocean. All he sees, when he seeks to harvest, is dirty, black smut. The weevil, only a quarter inch long, has multiplied so gigantically that farmers fear to face cotton growing.

Is there no remedy possible? Can one not grow larger crops in other countries, and so compensate for America's aching cotton void? True, China, Egypt, India, Russia, and other regions do grow cotton to a total of, perhaps, between seven and eight million bales. Yet it is impossible for them to augment their product by another twelve million bales. Why? They also are at the mercy of an insect pest, a cousin of the boll weevil.

IV.

Can anything represent more forcibly the lesson of the puissant might of tiny things? It means that here are two tiny organisms, which, *en masse*, can sway the fate of one of the world's most gigantic manufacturing organisations, and affect the life, and maybe death, of tens of millions of people. Science has surely some remedy, some death-dealing tanks or poison gas? The mosquito has been crippled, but so far the boll weevil triumphs. Even scientists of world repute are far from being optimistic that man will reconquer.

Arsenic seems the specific against this insect enemy to comfort and civilisation, but its price is the big obstacle to its greater use. The world has not enough arsenic for the task, and spraying an acre will cost around 45s.—so adding to your finished cotton prices; and then, well, rain may wash it away as a thing that never was. Think that there are, or were, approaching thirty-six million acres of cotton area in America, and you might high conclude that each instalment Britain pays to America in the reparations account would not suffice to keep the cotton bug under control.

It is a duel to the death between mighty man and a mitey insect. Withal, like every other disaster, it has some bright aspects. Cotton's calamity is linen's opportunity.

Further, the misfortune has stirred up us Britons to insist at last that our own wide British overseas Dominions shall supply our cotton supplies. In Australia, for example, cotton production has come on by leaps and bounds. Of course, it is not deemed a white man's crop, yet 7000 acres were so planted in Queensland during 1922, and thrice that area last year. In the House of Commons the tocsin of our danger of dependence on America has been sounded distinctly. Britain has already experienced that peril in the American Civil War era. So a definite policy of cotton development within the British Empire has now been determined upon.

Moreover, it is now obligatory upon all cotton spinners in the United Kingdom to contribute sixpence for every bale of cotton used. That levy goes to the British Cotton Growing Association to develop cotton areas under the British flag.

Is the moment not similarly opportune for like development of flax growing within the British Empire? Russia has proved a hopelessly rotten reed in our times of dire want, so why should we continue giving Russians £100 per ton for indifferent flax—flax which our own lands and people can supply? A ton of flax costing £120 is worth £200 per ton as yarn, £250 as loom cloth, £310 to the merchant, £360 to the retailer, and draws £480 from the customer at the drapery counter. So if this money can be kept in our own country it is vastly to our own national benefit.

Despite the extension of cotton growing by the British Empire Cotton Growing Association in various parts of the world, no material augmentation of the general cotton supply is to be expected in the immediate future. In fact, there are observers, who are not generally pessimists, inclining to the opinion that the days of big cotton yields will never return.

Meanwhile the effect of cotton's present scarcity and high price is unhappily realised in the parlous state of Lancashire's textile industry. The peoples of the world are not by any means affluent just now. In the East, as in Europe itself, there must be millions who have to choose between buying bread and a shirt; and their dire poverty finds echo in Lancashire. How gravely it has affected industries in this hitherto prosperous area may be deduced when it is stated that almost 80 per cent. of the numerous cotton-spinning companies which published balance sheets during January last were unable to pay any dividend. Hence the boll weevil exacts its heavy toll from even the widow and the thrifty old couple who look forward to comfort in their old age as their reward. Meanwhile, too, American experts predict that the raw material will advance even higher. Thus it would seem that cotton's bitter misfortune will point the way to linen's golden fortune.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

ARCHÆOLOGY was once regarded as a dull and miserable study, practised mostly by shabby and bent-backed old gentlemen, enormously bespectacled, poking strangely in dank and gloomy places to which owls and rats and worms were most attached. By what appeared their misdirected pains they discovered something about constructions thousands of years before, as it seemed, anything began to matter to our modern selves, and wrote obscure treatises upon it. It is realised now that those who thought thus about archæology were wrong, but they might have been attracted to it more had it not been presented to them so constantly as a study to be avoided. They did not then perceive that there is colour and romance in nearly everything, be the sensibility good enough and the imagination keen. Sciences are made to seem too 'scientific' for popular appreciation, and life is no gainer for the circumstance. Rescue work has to be done by such as Flammarion for the stars, and Henri Fabre for the insect world. During the last three or four years we have been passing through something in the nature of an archæological 'boom.' There has been an enthusiasm for searching below the surface everywhere in hope of the discovery of stones, and tombs, of the human constructions and evidences of extinguished civilisations, while ancient monuments, already rediscovered and exhibited, have been examined afresh for further interpretations and new evidence. These quests are proceeding and being described in all parts of the world, but chiefly in those parts of the Near and Middle East where began other civilisations that flowered and then faded, and the climax of interest and discovery seemed to be attained when the tomb of Tutankhamen was entered. Never did the past prepare such thrills for our present emotions as on that supreme occasion. But deeply interesting archæological work is being performed in many other places. A few months ago I revisited Pompeii, and found that the experts employed by the Italian Government have exhumed and reconstructed a new part of the ancient city, which tells us much more of the reality of the past than was known before, and corrects a number of mistakes. From there I went over to the African shore, and found indi-

viduals and parties digging many holes on the scene of ancient Carthage, a rich field perhaps for archæologists, and tempting enough when the plain wanderer can find for himself upon the ground many Byzantine coins, with an occasional one of an older time, and for a price within the means of any one can buy from the priesthood of the White Fathers, who are housed on the Byrsa hill, a real Punic lamp of terra-cotta which may have lit the way along a passage to his couch for one who knew Hannibal or had seen him in a Carthaginian street that day. Eagerness in searching for the relics of those long-lost civilisations has been so remarkable that one begins to wonder why people at this stage of history suddenly, and with such emphasis, should become impassioned upon this study or science—whether circumstances make a reason for it.

* * *

So then, is it not a matter of psychology, and is there not something a little morbid in it all, as being an investigation among the past, digging for the bones of civilisations that sprang from the raw material of crude humanity, developed, rose, strengthened, shone, glittered in great glory, and then, for their faults of excesses and other causes, faded away, faded and disappeared so utterly that scarcely a mark was left behind, so that now we must dig deep in the earth for traces of that strength and achievement once so great that they have seemed to make our own performance poor? Is there not morbidity in this business because of an uneasy feeling in the general conscience that we are of the latest civilisation that has passed its highest point of achievement, and now descends along a steep incline? How can we, when walking through Pompeii, or along the marble streets of Timgad, or reclining on the massive stone benches of the theatre at Syracuse, or pondering the problem of the place of the Punic ports on the beautiful Carthaginian shore, avoid the sad fancy that London and Paris must some time lie quietly like this in their almost forgotten graves; and that but a little later, as the time of the ages goes, New York and San Francisco will be called to their obscurity; and then, ages afterwards, another set of newcomers, hoping again to scale the top-

most heights, will pick and poke about among their bones, their sticks and stones, and wonder upon the revelations of their peculiar plans, of the much they made of very little, and the strangely perverse ways by which they destroyed their best when they had made it? Admitting to ourselves the truth of our present situation and the manner of our thoughts in uneasy times, is it not likely that much of this archaeological intensity is conjured by a form of morbidity? However it may be, it is worth the pains and cost. Never were morals of national existence pointed so remorselessly as in these exhumations. And, circumstances assisting, the glow of romance is spread in these times upon such studies and researches; they are made, as we say, popular, and so this archaeology, once neglected for being dull, becomes a daily feature in even the cheapest newspapers, while others treat it according to their state and dignity. What people realise now is that the upper layer of this earth is such a cemetery of civilisations as had not been imagined. And the simple amateur may, if he likes it, study archaeology amid delightful circumstances, and have, it might be said, pieces of whole civilisations for his own exercise. One could point to him a scene of beauty, covered with waving corn, orange, lemon, fig, and olive trees, flowers in masses, the most picturesque details of life, with ancient temples here and there and, beyond, a sea of brilliant turquoise, with a statement of the strongest presumptions for believing that somewhere here beneath the surface, and probably not far below, may be the finest specimen in existence of an old Greek theatre. It may lie in perfection under the old church that stands upon the hillside, as some believe. This is in Sicily.

* * *

The day being Good Friday, I loitered in delightful solitude in the Temple of Concord at Girgenti, one of the most splendid constructions still surviving in the world, one of the most beautiful of all ancient temples, and, with that of Theseus in Athens, one of the least injured of all that were made by Greeks. It was one of three or four that were built, between two and three thousand years ago, by the walls of Acragas, which Pindar the poet said was 'the most beautiful city of mortals.' The hotel where I was staying is set on the slope that leads from the edge of the distant plain, with the sea beyond, up to the pyramidal mount on which the modern town of Girgenti is built—modern but quite Sicilian, with nothing purposely done for tourists, and better for the circumstance. From the terrace of my place, with back to the new Girgenti, I looked that morning at breakfast in warm sunshine out upon one of the most impressive prospects that human thoughts might dwell upon. In the foreground and middle distance were thin trees

and various agricultural greens, leading the eyes over a wide expanse to a distance where stood up in noble boldness two splendid temples with majestic columns in grand array. Straight in front, less than two miles away, was that to which the name of Concord has been given; to the left of it, seeming by an illusion of the light and sight to be far off, but in reality only about ten minutes walk from it, was the Temple of Juno Lacinia. To the right again, but scarcely to be seen from here, were the ruins of the Temple of Hercules. Beyond the temples was the resplendent sea, with points of white for shining sails. Without the signs of time, the solemn warning, the lesson, the moral if you will, this majestic panorama is of a kind to make a man breathe deep when he surveys it in the morning light; but with the temples in their loneliness it is, I think, one of the most striking scenes of its kind on earth. I descended from the terrace and the gardens laden with violet cineraria and blooms of every brilliant hue, went through the field-paths with olive, fig, and lemon trees beside them and almond blossoms in massed pink—and noticed oddly stumps of old columns butting from tilled ground here and there, and stones like ancient steps as well—through the old Sicilian farmyard with a shrine on the wall, and down the white road, turning to the left to the temple that I sought. Thus, through the fields and the plain country, tilled and hedged and welled, and growing well, producing from trees and from the soil direct, I had been passing across what was once the heart of that city of Acragas to which Pindar paid his utmost compliment. Here there is nothing but herbage now, cereals and small fruit-trees, with a dog or a goat to give touch of animal life, and Sicilian peasants ambling along in the manner of those who know the world will wait. Of Acragas, that most beautiful city of mortals, there is little left to show but the occasional stumps and these majestic temples. But in their time, more than two thousand years ago, on this present silent pastoral scene was displayed the utmost brilliance and activity of a great civilisation. Colonists from Gela first founded it in the sixth century before our era. Slaves taken in successful wars were later employed in great constructions. Some of the wealthy people of Acragas had as many as five hundred each of them, and they were set to great works of excavations, to building the temples, and to making the fish-pond, which was one of the special wonders of the city. Its vast trade with Carthage made it rich, and its luxury became magnificent. Here, where now we may pass an afternoon without seeing a living person except, perhaps, a British or a German traveller—for there are many Germans—was once a city which, at the lowest reckoning, had two hundred thousand inhabitants, and once is said to have

possessed, including slaves, as many as eight hundred thousand. In those days its brilliance must have been something beyond our imagination now. The scenes about the steps of the temples must have indicated the wealth, the luxury, and the culture of the people; the processions, the sacrifices, the burning of incense, and the performance in the theatre must have been displays of brilliant life compared to which many of those we now attempt would seem tawdry. In time the Carthaginians attacked and captured it, plundered and partially destroyed it, and burned the temples. Acragas rose again, and took its place in the fighting world that had Rome and Carthage for the rivals and disturbers of the time, but it never equalled its former glory. It declined and, so far as the ancient city was concerned, disappeared.

* * *

So one looks on it now as one might stand on a peaceful morning by the grave in a village churchyard of one who was in his time, long ago, a leader of men, with a little grass and a few daisies growing on it, and sparrows twittering on overhanging trees. For the most of a morning I sat on big stones where once was the old city wall, near to the Temple of Concordia. In the great days of Acragas there were several of these temples, six of them it seems, in a long line about these walls. The Concordia—an arbitrary name—is not only the finest of the remains, but is considered by those who know and understand to be one of the most beautiful of ancient temples in existence—majestic, fascinating. Once, long after the great days of Acragas, it was turned into a Christian church, dedicated to Saint Gregory, and to that fact and certain subsequent restorations it owes its present wonderful state of preservation. All its glorious columns, thirty-eight of them, stand with their architraves and frontons. There are thirteen columns on each side, and six each at the ends. They stand on a stylobate or platform reached by four steps, the length of the temple being thus about forty-four yards and its width about half as much, while the columns are twenty-two feet in height and four in diameter. The situation is remarkable. The rough, herbage-covered ground slopes immediately away from the side opposite the sea, while on the other a cliff, littered with broken stones, descends abruptly to the plain. Near by, on the landward slope, there is a gnarled olive-tree; farther, there are almonds in full bloom. Amid the dull gray-green of the grass there may be an iris here and there displayed, pimpernel and gladiolus, and some yellow spots and daisies. In the distances on one side is the sparkling sea, on the other Girgenti gleaming white, and here before us the columns of the temples glow in a rich amber tone. The play of sunlight on this colour of stone, especially late in the

day when the light itself mellows and becomes more insinuating and delicate in its attention to these affinities, is a fascinating and emotional thing. Effects of light and shade, and especially of reflections, dazzle afresh at each succeeding glance. The Temple of Juno Lacinia, half a mile away, of which twenty-five whole pillars still stand erect, is not so completely preserved, and, being half in ruins, leaves the interior more exposed to light as well as weather. Contemplating it one morning on the sloping side away from the sea, I witnessed a transcendently beautiful effect, for the sunlight struck upon the inside of the outer columns that were nearest me, and was reflected brilliantly and powerfully to the front of inner columns in the shade that were visible from this point. That heavenly reflection to those aged, amber-coloured stones, so warm and rich and mellow, is a memory which, for sake of one's sensibility, I trust will never fade. But the Greeks themselves did not enjoy all this. These stones did not glow in gold in their time, when the temples were complete, because these columns and all the rest, made of sandstone as they are, were cased in fine stucco and smoothed and painted in various colours. If a mind is fresh and willing, it should be the better for a long and silent contemplation of the beauty of these temples in their majestic loneliness, in their story of a greatness that is past. It is through their loneliness, their solitude, and the bewitching effects of colour and nature about them that they strike awe and wonder upon us, and flash inspiration through our beings. Were such a temple standing in London, or somewhere near, it would be interesting and impressive, but not the same. Girgenti, with the charm of Sicily and the historic romance of the island—Girgenti, facing Carthage on this cliff by the broken wall, near to the turquoise sea, is the true place for the Temple of Concordia. Here, then, is archæology in its most enrapturing form. Chords of music of the Grecian past that were absorbed within the stones, noble music swelling as from an organ, seem in the fancy to be set floating about us as we think and wonder with a sense of our humility, yet with hope maintained. So much has passed away. . . . At noon I walked up the steps of the temple and rested within for an hour or more, with the sun at its height. I had brought a little food, desiring the full day of this Good Friday for the peace of these matchless temples. Lizards were darting along the stones, and a herd of Girgenti goats, big, white, frisky fellows, with long and spirally twisted horns, was driven by, but otherwise there was no sign of life.

* * *

" Lower down the road, in the opposite direction from Juno Lacinia, there are other ruins of temples, those of Hercules and Zeus, and

the stately columns of Castor and Pollux. The Temple of Hercules is now being in part restored, and when the work is finished it will be among the most impressive sights of Girgenti. One cannot be sure that this work of archaeological restoration, which was started, and is in a large measure being conducted by, two Englishmen, the brothers Hardcastle, is not of its kind the most interesting being done anywhere. The Hardcastles offered substantial funds to the Italian Government for authority and co-operation, and for some time past many men have been engaged in erecting again several columns the parts of which have lain alongside in tumbled masses through the ages. There are signs enough that the Temple of Hercules must have been one of the finest in the ancient city of Acragas. Probably it dates from the sixth century before the Christian era, and this also was destroyed by the Carthaginians, whose system was to cut away the bases of the columns cone-wise, sharpening them, as it might be said, until they nearly rested on a point. When this was done the roof was set on fire, and the various expansions and contractions that ensued soon caused the columns to give way, when the whole edifice fell in a fearful crash. Subsequent earthquakes have assisted the destruction of this temple. But here still lie in rare confusion, just as they fell ages back, the gigantic sections of columns, some with the ends sharpened as I have said by the Carthaginian destroyers. The sections are each about eight feet high, and the diameter at the base about seven feet; the circumference twenty feet. The average weight of such a block of stone, I was told, was about nine tons. When the temple stood complete there were fourteen or fifteen columns down each side, and six at either end. The scene on the south side, where the broken columns and capitals rest where they fell, is one that forces fancies of Titan and Samson. To arrange properly the pieces of this splendid puzzle and to hoist them to their places is the work of the reconstructors. When I was there three had already been set up, and scaffolding was about the fourth. The capitals were soon to be put on those four and the architraves laid across, and then probably four more columns would be erected and other work carried out. The chambers in the temple and various interior constructions are in good order. A statue of *Æsculapius* was found a long time back and taken to the museum at Palermo. Once the temple contained also a statue of Hercules, which Cicero declared was the most beautiful in existence then. It was a very splendid temple in its time, and its fame spread far. These and others are the visible remains of the great Acragas, which has been almost completely lost. Despite all the considerations, it comes into our thoughts

again that it is strange, so strange, that even with time at its longest all but these few traces of that great Acragas should so completely disappear, and that grass should grow and flowers bloom where it was once. Could indeed our living present ever lapse to such an obliterated past? The excavators have other thoughts and quests besides such as are associated with the Temple of Hercules. A city like Acragas must have had a beautiful theatre at one time; it may well have been the finest of all those Grecian theatres in Sicily. Nor would it be easily destroyed—yet there is not a trace of it. Where is it? An idea exists that it may be buried under the old church of St Nicholas, on the slope of the hill leading to Girgenti. A great expansive work of excavation upon the scene of old Acragas might lead to big results, but, as in the case of Carthage, there is little that is certain to act upon, while the area is very large. It is not known how thorough was the work of destruction.

* * *

I have a speculation that ere long, perhaps in a few years, the need for excavation work as conducted now will disappear, and that suddenly the secrets of the earth will be revealed without any boring or laborious digging. When electric waves can be directed unassisted, not hung to wires, through space to the ends of the world, when a photograph may be made by mysterious rays through a solid substance of something within or on the other side, and when every day science is delivering new challenges to obscurity, I do not see why our children in their farther and more contemplative years, they also mooning upon the lessons of the past, should not take a little instrument in their pockets and, with it, find that a city belonging to the most ancient times lies beneath the plain they have traversed, that its towers were even then close up to the surface. If there is anything in continuity of effort and discovery, the power of divination of what is below the surface is an inevitable sequence of science, and one that will transform again the effort of the world, for mining and all pertaining to it will be no longer what they are. Archaeology in the future may lose something of the sense of romance, and even what might be called the sporting flavour, that are attached to it in these times. One's thoughts recur again to the declaration of the French scientist that the light of old must have made impressions of surrounding scenes upon the stones, photographed them, as it were, and that these impressions are still there and perfect, since things of this kind are never destroyed, and only need the knowledge for their development and display. Such discovery would after all

be only a corollary, a plain connection to many that have been made. We of this era may yet in newer cinemas see the real Caesar striding to the Roman senate. I would like

to see those girls of Grecian stock with flowers and palms dancing their way beside the temples of Girgenti, where the fires burned and the incense rose.

THE YELLOW STREAK.

CHAPTER VIII.

UP on the hillside the whole party awaited the appearance of Hume before commencing luncheon. Owing to the break in their conversation, Walton had forgotten to invite him, and, in order to make amends, had sent Doyle down at the eleventh hour with the belated invitation.

Norma awaited the return of the messenger with feelings that were a queer mixture of anxiety and impatience, all the time assuring herself that her anxiety on Hume's account was caused solely by the fact that he was her father's guest; and as neither he nor the messenger returned, she began to feel piqued. 'I think you had better commence,' she said. 'I will go for Mr Hume; the boy has evidently missed him.'

'Shall I accompany you, Miss Walton?' asked faithful Terry Wingate.

'No, thank you,' was the reply, couched in a tone which rapidly reduced him to silence; and leaving them, she walked slowly down the hillside towards the private car where they had left Hume.

Passing the office stealthily, she peeped carefully through the window of his private room, and was amazed to see the object of her search bound helpless in his chair, with three masked men before him. Too terrified to move, she clung to the window-ledge with shaking hands, and watched the scene that was being enacted with fascinated eyes.

'Now, see here, Mister Hume,' came the drawling voice of the tallest of the three men, 'this is where we get a nice, quiet, uninterrupted, brotherly chat. Waal, now, things have been just a leetle too hot since you hit the caboose with this reformin' stunt of yours, and this bit of "movey" business has been figured out to change 'em slick; so get next quick. If you'll give us your word to beat it out of this as fast as steam can take you, we'll loose you up and give you a little present that'll make it quite worth your while.'

'What if I refuse?' queried Hume coolly.

'Then you'll sit in that chair until they take you out to bury you. You've got just five minutes to decide, and in case you're expectin' help from outside, let me tell you that every guy near this show's in at the game; also I've got a Maxim "hush-a-bye" on this gun, so nobody'll hear you get it.'

Hume's face paled, but he turned his eyes resolutely to the face of the clock which ticked away unconcernedly on the wall, and Norma waited, in agonising suspense, for him to yield. For the full five minutes he waited, then a slow smile flickered over his face.

'I am much obliged for your very interesting information,' he drawled sarcastically. 'However, since I have been able to put this concern on a sound basis, in spite of the machinations of scoundrels like yourself and the rest of your band, I shall take care that it remains there so long as I am in the running. If I should go out, then my successor will find everything cut-and-dried, including full information of the outrages perpetrated during my administration and the names of those responsible for them. Well, the five minutes are up—in fact, they have nearly grown to ten. Why don't you shoot? Bah! you are all cowards, now the psychological moment has come. Just to prove my words I'll name you all. You,' nodding his head towards the spokesman, 'are Dicksee, and the other poor tools of yours are Malcolm and Moore; and to the three of you may be attributed much damage and the murder of twenty-six innocent people at Corriente Dip, all of which you will answer for in an adequate manner. I will see to that. Another little detail; it really was not worth your while to purloin those locked boxes from the store room. The gold ore contained in them has been returned to the El Oro people, from whom you stole it.'

'Waal, Mister Hume, that's about the frozen limit, and though I'm real sorry to say it, here's where you go out. You're one of the few guys that's ever managed to double-cross Herman Dicksee, an' the man that does that isn't going to live long enough to crow about it more than once.' He raised his revolver, and Norma covered her face with shaking hands.

'Drop them guns, ye murderin' devils, or I'll plug ye so full o' lead yer own mothers won't know ye?' and Wells, brandishing a huge blunderbuss, burst into the room, followed by the sheriff and his men, who quickly disarmed the ruffians and tore the masks from their faces, to prove Hume's words correct.

'How on earth did you manage to get the sheriff so opportunely, Wells?' asked Hume, as he stretched his cramped limbs and arranged his disordered dress.

'It's like this, sir. I've been keeping a bead on Moore ever since he broke jail, and by nosing about I discovered that a raid was fixed for to-day; so I took the liberty of signing your name to a wire asking for help. They must have got wind of my game—tapped the wires or somethin'—because they laid dynamite cartridges on the line to blow the sheriff and his posse to Kingdom Come; but I soon stopped that little game.'

'Wells, you have done the company an inestimable service, besides saving my life, and I, personally, will see that your actions are reported to the chairman.'

'D'ye think that I might have my old job back, sir?' asked Wells, with glee.

'You shall have more than that, if I can obtain it for you,' replied Hume earnestly.

The driver coloured up with pleasure, and as he tried to stammer out some incoherent words of thanks Norma Walton reeled into the office and sank half-fainting into a chair.

'Get some water quickly,' rapped out Hume, taking the situation in at a glance.

Under his ministrations she soon recovered, and with the return of her faculties she assumed the half-imperious air which had ever been his delight in the old days.

'Send that man away at once, Kent,' she whispered.

'Take Doyle into the sick-bay and see that he is attended to immediately, will you? And, Wells, come back at four o'clock; I shall have something to say to you then.'

'I hope you have not been unduly frightened, Miss Walton,' said Hume, more to cover her embarrassment than for any other reason.

For some moments she remained silent, then as she essayed to speak a faint tinge of pink appeared in the pallor of her face. 'Kent,' she began slowly, 'once I called you a coward; now I must beg for your forgiveness. For the last ten minutes I have been outside the window and saw all that happened—you were splendid. Do please forgive me.'

'There is nothing to forgive,' he said seriously. 'I am still the same man that stood by and watched a dirty, insolent old ruffian despoil you of every valuable you possessed without raising a finger to help you; the same man with the same yellow streak.'

'No, not that,' she replied warmly; 'and Kent, have you still got m—— the ring?'

'Yes,' he said sadly, taking it from his pocket; 'it has never left my possession since you—since I left Palm Beach, and I would not part with it for worlds.'

'Let me see it, please.'

She took the ring from his hand, and something suspiciously like a tear rolled down her cheek as she placed it on her finger and raised

it to her lips. 'But you *have* parted with it,' she said, in a voice that held both laughter and tears, 'and for something that is not half so valuable as even the tiniest bit of—of even one world.'

'And that is?' he questioned breathlessly, amazement tinging the look of devotion that illumined his eyes.

'Why,' she replied, blushing adorably, 'can't you guess! A silly goose of a girl who once called the noblest of men a "coward"—my poor, unworthy self. Oh, Kent, Kent, I have been so unhappy all this time. Why, why did you not take me into your arms and kiss all my mistrust away?'

'How could I, dearest, when you were right all the time? I am a coward.'

'Not another word of that kind, sir, or,' with an assumption of sternness, 'I shall have to punish you very severely. And now'—with a kiss—'come and see daddy.'

'Great Scott, man! How on earth did you manage it?' asked Walton, with an air of glad surprise. 'Why, she has had bushels of offers and refused them all. I was beginning to think that she would be an——'

'Don't you dare to say an old maid, daddy,' broke in Norma laughingly.

'All right, a bachelor girl, then,' went on Walton; 'that's the new-fangled name for them, eh? However, I hope you will both be very happy.'

'Congratulations, Kent,' said Leighton, wringing his hand heartily. 'Now, don't you think I was right?'

'You were. I owe it all to you, Jasper.'

'Rubbish,' replied Leighton; 'that yellow streak of yours is a myth.'

THE END.

THE LITTLE SECRET PATH.

WHILE I was walking all alone

Amongst the tallest plants and grass

In the wee wood that's all our own,

Where trespassers may never pass,

I found—a pathway! in between

The plants, half-hidden by their green.

A tiny pathway, bare and brown,

And worn away by some one's feet;

The little leaves were trodden down

Though grass grew round it, tall and sweet,

As though to guard the secret track

For some one who was coming back.

I tiptoed off and left it there;

I guess I was not meant to see

That secret path, all brown and bare.

It was for some one else—not me.

And, though I do not quite know why,

I never peep when I go by.

E. T.

A LUCKY COIN.

By E. HERBERT MORRIS.

WE numismatists are not a numerous lot. As a result there is a certain freemasonry among us. We detect each other in the act of poring over glass cases in the British Museum, and we forgather in musty auction rooms where, after the serious business of the day is over, and all the grand pianos, Jacobean chairs (alleged or otherwise), drawing-room suites, and kitchen fire-irons have been disposed of, a little coterie remains behind to wrestle with each other and a bored auctioneer over a few little metal discs with quaint markings upon them. Bits of metal they are indeed, and quite worthless, some of them, to the eye of the unimaginative appraiser of commercial commodities, yet to us precious and beloved.

Your true coin collector, like the poet, is born and not made. That is why, as I say, there are but few of us, and we have a freemasonry of our own. The curious thing is that every coin collector is both the rival and the associate of every other, and might sign himself, like Sir Andrew Aguecheek in his famous challenge to Cesario, 'Thy friend as thou usest him,' and 'Thy sworn enemy.'

In the auction room, thirsting for the possession of some choice specimen of an old Spanish doubloon, or one of those pieces of eight with two lions and the fleur-de-lis on them, we dart at each other looks like barbed arrows together with our bids, and you would think that all the hatred and malice of thwarted avidity were left rankling in the bosom of the defeated contestant. But it is not so: immediately the gentle and joyous passage-of-arms is over we are the best of friends, and we colloque together on coins old, lost, rare, and forgotten, to our hearts' content.

I am a hereditary coin collector, my father having written a well-known monograph on the subject and early indoctrinated me in the sweets and sorrows of collecting. I started a little cabinet as a boy, and, in the enforced leisure which has fallen to the lot of an invalided and somewhat battered soldier, I have been able to pursue it with some success. It is sinful to boast, but even my detractors admit that my series of Richard the Second groats and half-groats, with the crown bust within a treasure of nine arches, is unique. Then, again, my silver shillings, dated 1554, are rather famous. That pretty coin which represents Mary, not as the stern heresy hater, nor as a majestic queen, but face to face with the Spanish husband whom she loved so well, but for whom the English people cared so little, is represented by several well-nigh perfect examples. It was this coin, where the two royal faces are in profile

opposite one another, which gave rise to the couplet,

Cooing and billing,
Like Philip and Mary on a shilling.

But I lose myself among my coins. This is a story, not a catalogue. I first saw Helen Oldcastle at Timkins' sale-rooms in Oxford Street. By the glint in her eye I knew at once that she was a collector. Tall, and yet not too tall, a bright, bird-like creature with dark eyes, raven-black hair, and a singularly charming face, she looked among the litter and disorder of that sale-room like a rare jewel in a heap of rubble. To the soul of the collector rarity is ever the lode-stone, and he moves towards it instinctively. It was thus that I moved towards Helen, although I could not claim her acquaintance, and took up my place beside her, while the auctioneer's monotonous cry of 'Any advance, gentlemen; any advance?' went on. He was selling a little parcel of coins as part of a general sale of household stuff. They were not catalogued individually, but simply listed as sundry coins. About forty or fifty people were gathered round the long table, those who had arrived first having been fortunate enough to secure seats. The auctioneer was standing on a little raised pulpit at the farther end, and his men were placing on the table or holding up to view the various articles for sale. The unknown lady and myself were at the back, and when it came to the turn of the coins it was difficult for us to see over the heads of the others who were craning forward. An assistant shook out the contents of an old velvet bag upon a tray, and showed the coins to a few people in front.

'I hope he will pass them round,' said Helen, in a whisper, as though to herself.

'I don't think he will,' I ventured to reply. There is, as I have said more than once, a freemasonry among numismatists which permits this sort of thing. It's like an exchange of courtesies between knights before they take a bout with the lance. The lady turned to me with a little start, and as though to indicate that I ought not to have spoken to her, addressed herself, like the Greek chorus, to the world in general, or to the audience.

'It's a shame. They ought to show them round, and give everybody an opportunity of seeing them.'

I think she was a little astonished when a moment later I said in a loud clear voice, 'Mr Auctioneer, we should like to see those coins at this end of the table.' It was not really a tactful thing to do. The dealers grinned and pricked up their ears. The correct attitude to

adopt at all sales is one of gloomy indifference, as who should say, 'I am here, gentlemen, but for no set purpose; I have no fads or foibles; nothing will induce me to part with good, hard-earned money for such trinkets or baubles as these. If you insist on forcing them upon me at bargain prices, that is a different matter.' Any show of eagerness or the slightest departure from this cold and aloof attitude at once betrays the amateur.

Nevertheless the lady at my side seemed pleased when the tray was passed round and submitted to her close inspection. I, myself, observed a Cromwellian half-crown with the crosses of St George and St Andrew and the Irish harp upon it, with an escutcheon of pretence which intrigued me somewhat, and I could see with half an eye that my new friend—for already I called her so in my heart—was bestowing an idolatrous look upon a large thirty-shilling piece, marked Jacobus. D. G. Ang. Sco. Fran. et Hib. Rex.

Both of us, however, had recovered our sense of tactics, and assumed as stolid and wooden an expression with regard to the contents of the tray as though we were in church and it was the collection plate into which we had just dropped our modest offering.

The bidding in a small way was fast and furious, and when I at last secured the little velvet bag for twenty-two pounds ten I prepared to hand over my cheque with a mild sense of triumph. The lady had been one of my antagonists, but had dropped out at twenty pounds, and for the first time in such a mimic contest I felt a remorseful sympathy for my friend and enemy. I looked round, but in the moment when I was paying for the coins she had disappeared. 'It's the fortune of war,' I said, hardening my heart, and strode out of the building—but in such a war woman possesses one weapon which is all-powerful.

As I pushed my way through the loiterers in the lobby I caught sight of the fair collector. She was in the act of replacing in her reticule a little lace handkerchief, and as she quickly adjusted her veil I detected the faintest gleam of moisture in her eyes. I was embarrassed. It is one thing to speak to a lady on a small but necessary matter of business in a business room; it is quite another thing to force impertinent and unwelcome sympathy on a woman upon whom you have just inflicted a disappointment. I was, however, rescued from the difficulty by an event so common-place and ordinary that it appeared like a theatrical cue—she dropped her handkerchief. I could do no less than pick it up and return it to her. Our eyes met. Mine, I knew, conveyed an amused twinkle of interest and of sympathy; hers were distinctly accusatory.

'I'm sorry we could not both have that little bag of coins,' I said soothingly, 'but perhaps——'

'Oh, it's of no consequence, thank you,' said the lady, in a tone which meant that it was, but that she did not choose to be slobbered over. I liked her spirit, but being naturally rather a shy person found it extraordinarily difficult to proceed.

After a moment's reflection I did, however, summon up courage enough to say, 'May I offer you a cup of tea, and then you can see the coins at your leisure, and if——?'

'It's very kind of you, but I think not.'

'Now I know just what you are going to say,' I retorted; "'we haven't been introduced." But consider, you are a collector of coins; so am I. Doesn't that make a difference?'

It did. We went into a Lyons tea-room, and selecting a corner table, I sat down opposite Helen for the first time. It was only then that I fully realised the way in which the fascination of her mere presence had taken hold of me. I fumbled with the bag of coins, and while she looked at them, I looked at her. All the time those lines kept running in my head:

Helen, thy beauty is to me
Like those Nicean barks of yore,
Which gently o'er a perfumed sea
The weary, way-worn traveller bore
To his own native shore.

Yet at that moment I did not know even that her name was Helen.

I have not the least idea of what we had for tea, nor of what we said about coins. I was gazing at her, and wondering about her, completely obsessed by her personality. I considered myself, and was considered, a steady, serious, unemotional young man of quiet habits, yet I don't suppose anybody ever fell more completely and helplessly in love at first sight than I did.

We had a little bargain over one of the coins, the thirty-shilling piece, to wit, and she insisted on paying me for it out of a delicate little old tooled leather purse, which closed with a silken cord. I ran on about all the quaint things I had seen in the French collections, but while I talked of the beauty and rarity of coins, piling adjective upon adjective, I thought about her—how rare she was, and how beautiful. Perhaps something of this showed in my manner, for presently she rose, as though feeling that our talk had continued too long for such a chance encounter, and with one of the sudden, abrupt yet graceful movements which suited her so well, she prepared to depart.

We stood outside on the pavement, and it was then that a kind of panic seized me. She was going to leave me, to disappear into the immense forest of human faces which is London, and I did not know her name. She held out her hand, and thanked me prettily.

'I do not know—I have not asked your name,' I gasped.

'My name is Helen,' she began, then suddenly added, 'Oh, this is my bus—I must catch it.'

She shook my hand, smiled, and was gone. I am not a man naturally addicted to violent language, but I admit that what I said about the London omnibus service generally, and the custom of some conductors in whisking passengers into the interior of one of those capacious vehicles, and then disappearing into the half-light of a misty November afternoon, was strong. The behaviour of that particular bus struck me as singularly odious.

I said so. In my anger I consigned the floundering monster which had bereft me of my angel to the nethermost regions, and only stopped cursing when I recalled that if the bus really went where I was sending it, it would carry her like a new and more beautiful Persephone to the same dark kingdom. Bitterly did I reproach myself for not having sprung upon the tail-board of the bus; but bus and tail-board, fare and conductor alike, had vanished from my sight, and it was not till many weary months had passed away that I was to see again that fair, white brow, and those keen dark eyes.

Not until nearly a year later did Captain Charles Ballard, from whose diary the above veracious notes have been abstracted, again see his Helen Incognita, as he had learned to call her, and their meeting came about as the result of so strange a coincidence that we, the faithful collator of these chronicles, may best record it by quoting the substance of a letter, sent by Helen Oldcastle to her old school friend, Clara M'Guinness, and now speeding on its way to greet that good lady in Hobart, Tasmania. It runs thus:

'You remember all that I told you about that strange coin-collector man. You are the only person to whom I did tell it, just because you are nice enough not to chaff me, and discerning enough to know exactly how I felt. Well, you always said there would be a sequel, and you are right. It has happened in the oddest way. I was staying with my Aunt Agatha at Evesham this summer, a delightful part of the much maligned Midlands, and one day I rode out on my bicycle to see the little village of Broad, the most delightfully picturesque old place, all thatched houses and antique gardens—a glorious ride, and such roads!

'Just as I was nearing the village I espied a large silver coin lying on the road-side. You know my passion for old coins, and you may imagine that I was off my bicycle in a trice. It was a five-shilling piece, and although of course they are no longer in common currency, quite modern, and so a disappointment. I put it in my purse, and was just about to remount, when a runaway horse dashed past me at break-neck pace. I am not really superstitious about coins, but I could not help feeling that if I had

not got off just when I did, I should certainly have been knocked down.

'On arriving at the village, I made some inquiries, and discovered that a Mr Geoffrey Ballard, who lives here, had lost a five-shilling piece. Although a coin-collector, I am still "indifferent honest," and I proceeded at once in the direction indicated to me, towards a very charming old house, half-villa, half-cottage, embowered in trees, and surrounded by a quaintly trimmed privet hedge.

"Are you Mr Geoffrey Ballard?" I inquired of a dignified, white-haired old gentleman, who came to the door.

'He was, and when I gave him his five-shilling piece he seemed for a moment quite overcome with joy. This surprised me, and the more so when he took me into his study and showed me his cabinet of coins.

'His collection is really a fine one, and when he dropped that plain, ordinary five-shilling piece into its place side by side with some really priceless examples of old moneyers who have been dead and gone for many a long century, I could not help exclaiming, "Surely you do not put this in the same category as those splendid Henry the Sixth silver groats, with the foliated crosses, and the king in his ship!"

"I value it quite as highly," he replied, with a smile. "If you like, I'll tell you its story."

'I begged him to do so.

"Why, I don't know that it's much of a story after all, but I always say that this five-shilling piece was the foundation of my fortune. I'm a tolerably well-to-do man to-day, but thirty years ago I was in an uncommonly awkward position. They say that every man can write one good book if he tries, and I think it is true, too, that every engineer can invent one decent machine or improvement in a machine. I made my contribution thirty years ago, and I have never equalled it since. It was a machine for cutting bevelled gears, and my only chance of making any money by it lay in getting the patents registered quickly at home and abroad. It's a pretty expensive business, as you may guess. Cost me £2000, and took practically every penny I possessed. But when it was done, I felt as happy as a king and as confident of success as if I already had ten times that sum in my pocket. Then my troubles began. I could not get any one to take the blamed thing up. I trudged London from end to end, ferreted out everybody who took the slightest interest in such matters, and laid siege to all the banks and financiers who would give me a hearing.

"It was all in vain. Nobody seemed to want either me or my machine. I was beginning to despair, when I met Donald Fraser. Ah me, he was a dour man was Donald, but he's been a good friend to me. He was an Aberdeen

lawyer who had settled in London, and was in the company promoting line. There was Fraser himself, Matthew Hearnshaw, and David Allen, and they sat round a mahogany table in a little dusty office in Chancery Lane to decide my fate. They were all three hard, gripping business men. They talked, and I talked, and nothing came of it, except that the longer the talk lasted the more certain I became, by their looks, that not one of them was inclined to put up a brass farthing for the company to run my patent.

"'Weel, Maister Ballard,' said Donald at last, in his slow Scottish way, 'you've convinced us that the patent will hold water, and that the machine can be made to work, but neither I nor my friends feel disposed to be the pioneers in the business. Can ye no mention any person who's willing to put up some of the money required?'

"'Ah, that's it, Mr Ballard,' the other two chimed in. 'What promises have you got already?'

"'I had nothing, and I told them so. Donald Fraser began putting together his papers, preparatory to breaking up the sitting. He turned over an envelope and tossed it over to me. 'Oh,' said he, 'that arrived for you at the office this morning.'

"'Mechanically I opened it, and out there dropped the identical five-shilling piece you picked up in the road to-day. My son had sent it, my little six-year-old son, who was just off to school that day, and with it a little scrawl, ill-spelt and blotted. I was so worn out with anxiety and disappointment that this seemed at the moment the last straw, and I almost choked as I put the little fellow's letter down, saying, 'It's only a note from my boy.'

"'May I see it?' said Donald.

"'I made no objection, and old Donald read it without moving a muscle. 'Gentlemen,' he said presently, 'this is a verra important document. It is the first application for shares in the Geoffrey Ballard Engineering Company, Limited. "Dear Daddie," it runs, "I am sending you my pocket-money for this term to put in your new company 'long with the other pennies, with my best luv, Charlie."'

"'Would you believe it? Those men were as different as could be from that moment. It's a funny thing, Miss Oldcastle, how a touch of

nature affects people. I've often observed it. The facts of the situation were just as before, but somehow the atmosphere was changed. They decided then and there to float the company; my little son's letter had just turned the scale, and every bit of prosperity I've had since has been derived from it. So now you will understand why I value that coin. It represented my boy's faith in me, and in one way and another it has been like a lucky mascot in our family ever since. When my boy marries, if he ever does, I'll give it to his wife. Till then I think it's worthy to take its place with the best in my collection. But here comes Charles—let me introduce him."

'I looked up past the gray-lined face of Mr Ballard, and his sweet old wife in her lavender silk frock, and in the half-light saw a tall young man enter. He kissed his mother, greeted his father, and turned round to me. The light from the low-latticed window fell full upon his face, and to my astonishment I recognised my "collector man." I suppose for a second or two we both looked somewhat foolish. It is rather absurd to be so glad to meet a mere chance acquaintance again, and I remember thinking that when I knew Captain Ballard better I would tell him that it is really not usual, on meeting a young woman at a tea-table for the second time, to grip her hand as though in a vice, and stand mutely staring at her till she is out of countenance.

'But it soon passed, and then we spent a very charming hour talking about coins.

'I found that Captain Ballard had a collection of his own, all old English just like mine, only whereas I had two Edward the First pennies struck by Robertus de Hadelie, he has an appropriate counterpart in Plantagenet eagles. As for later things like my Charles the Second two-guinea piece with the four shields arranged as a cross, he has something to match these in his pewter series of the same period.

'It seems almost a pity to keep two such complementary collections apart—at least that is what Aunt Agatha said, but of course she knows nothing about collecting, and has such absurd ideas—

'P.S.—I am just opening this letter again to tell you that Charlie and I are to be married on the 15th of next month.'

A GIPSY OF THE NORTH.

CHAPTER XIII.—THE RUSSIAN MISSION.

PADDLING steadily, Carwyke wondered how far it was true that Billy was 'scotched,' to use Standifer's phrase. Would he, before the canoes dropped out of rifle-shot, make a further attempt on Norma's enemies? That

was more than possible; but, as he realised, it would depend on how quickly Billy learned that they had really embarked, and again on the speed he could make through the thick wood. He hoped that his friend would not be so foolish

as to break cover, and yet trusted that he would be able to use the opportunity offered by the open canoes.

The deserted camp was perhaps four hundred yards behind them, when he had evidence that Norma's henchman was not neglecting his opportunities. He heard Standifer give a shout of warning, caught the crack of a rifle from the bank—and then came an answering shot from the canoe behind, and on the heels of it an exultant shout from Standifer.

'A hit! By——!'

'By Sam! He's got the beggar!' cried Bull.

Roy Carwyke's heart seemed to turn to lead within him suddenly. Ceasing to paddle, he looked round. The second canoe was drifting with the current. Mardock was staring over his shoulder towards the bank, Norma's face was buried in her hands, whilst Standifer, rifle in hand, was looking shorewards, alertly. The men in the canoes offered an easy mark, but no shot came from the bank. That fact was to Carwyke the most significant thing of all; more convincing than Standifer's triumphant shout, or the sight of Norma crouching with hidden face. He was wondering whether the scoundrel would order him to land and make sure that Billy was dead, when the harsh voice rolled across the water: 'Forward, you vermin!'

Bull grunted and dipped his paddle, and almost automatically Carwyke followed suit. One thought was beating in his brain as he helped to drive the canoe from the scene of tragedy. Norma had no one to depend upon but himself now, and he was more or less helpless in Standifer's hands. Delivered from the fear of pursuit, the fellow might decide that his way was now clear before him, except for Bull and himself, and decide to dispense with them by casting them away in the wilderness. To be rid of them finally and for ever Standifer need do nothing more overt than set them adrift without weapons or food. For a time they would be able to eke out a miserable existence in the woods, but when the winter storms swept down out of the north, the end, sure and inevitable, would come.

But he would not die that way and leave Norma in Standifer's hands. There was another way in which he could die, a way that he would gladly take. Somehow, weaponless as he was, he would kill Standifer, even though he himself died in doing so. Yes, that was the way. Mardock was of a different calibre from his friend, and had even professed a certain friendly regard for Norma, who might be safe in his less ruthless hands. True there was Bull—— His thoughts broke off as he stared at the broad back before him. Bull might revive his old plan of carrying the girl away, if he had a sufficient motive, and if Mardock were not

strong enough to cow him. But what was the motive which had moved him to attempt to out-general Standifer, and what had he heard from the big Russian that had made him seek to get Norma into his hands?

Quite suddenly he asked a question: 'Bull, what made you turn against Standifer?'

The man in front gave a grunting laugh. 'Wanted the girl, in course!'

'But why did you want her? Was it something that man at the trading-post told you?'

'Yep!' replied Bull laconically.

'What was it? Something about the girl?'

'Yep!'

'What? Tell me; I'm rather curious.'

The man turned his head, and on his battered face his questioner saw a look of amazement. 'Mean ter say ye don't know?'

'Yes; honestly I don't.'

Bull grunted his surprise. 'Standifer never told ye?'

'No.'

The man laughed callously. 'I'll be shot if I tell ye, then! We ain't out o' this yet; I ain't giving away the best thing I ever had within reach o' my paws. Standifer's top-dog now, but he ain't going ter be all the time. Sooner or later he'll grow careless, an' then, gun or no gun, I'll wring his neck, an' Mardock's too.'

It was clear that the man would not, at the moment, reveal the secret that he had learned from Nicholovitch; and Carwyke, still seeking to learn the man's whole mind, turned his thoughts into another channel. 'Have you considered that Standifer may yet turn us adrift?'

'I'll lay all I've got an' ever hope ter hev— an' that's millions—on it.'

'Millions!'

'Yep!' Bull laughed. 'I ain't for ever goin' ter be a poor sailor-man as any crimp can send ter sea. One o' these days I'll be ridin' in a motor-car an' hev a steam yacht wi' a cap'n I can haze—same as I've bin hazed most o' my life.'

Carwyke recalled what the Russian had said, and his mind linked this naïve confession thereto, but his tongue gave no indication of his thought. Instead, he harked back. 'But suppose Standifer does turn us adrift?'

'I ain't goin' ter let him. I'll follow him an' that girl on my hands an' knees across Alaska.'

'You'll have something to do then,' answered Carwyke, with a laugh that was deliberately provocative.

'I'll do it,' said the man grimly. 'I ain't goin' ter give Standifer best, as ye'll see presently.'

The man fell silent, and though Carwyke tried him with other questions, he got no more

than grunts for answer, and was forced into silence himself at last.

Mile by mile they pushed on, the river broadening as it was fed by confluent streams. Once they passed the tepee poles of a deserted native encampment; and once a closed cabin built by some prospector or trapper, but now deserted. Several times they sighted moose on the edge of the woods; and once a bear, wallowing in a muddy place, startled at their unexpected appearance, hurried up the bank, and sought the shelter of the trees.

A subtle change in the quality of the light, and rosy reflections in the river, with the same hues on the peaks of the hills, told Carwyke that the midnight of the northern summer was at hand. Weary of his cramped position in the canoe, and the muscles of his arms aching with the incessant paddling, he was hoping that soon Standifer would give the order to camp, when there came a sudden exclamation from Bull, 'Jumpin' Methusaleh!'

'What——'

'A village an' a church, by all that's holy.'

Amazed as Bull himself, Carwyke stared ahead. A turn of the river had brought into view a point where a tributary stream joined the waterway along which they were travelling, and on the tongue of land between was a collection of wooden huts, with two structures larger than the rest, on one of which was a triple cross of bronze, reflecting the rosy light of the northern sky. Carwyke instantly recognised the symbol of the Greek Church, and offered an explanation. 'Russian.'

'But what's it doin' here in this God-forsaken wilderness?'

'A mission station, I expect.'

'Wonder what Standifer'll do? Will he stop, think ye?'

'I don't know. If——'

'Ahoy there!' Standifer's voice broke in on his words. 'Make for the village.'

'That settles it,' said Bull. 'An' I ain't sorry, for I reckon that here I'll pick up some-thing' as'll help me ter knock out that beggar behind.'

Carwyke himself cherished a hope of his own. In a mission station surely it would be possible for a helpless girl to find sanctuary and deliverance from the machinations of such a man as Standifer. His heart was beating quicker with hopeful expectation as they swung the canoe inshore. Bull gave a shout, and out of the ramshackle cabins tumbled half a score of Indians. At the sight of the oncoming canoes one of the natives ran to the large well-built house beside the church, and as they beached the canoe Carwyke saw a white man emerge from the house and begin to waddle towards them. The man was fairly tall, but so obese that he looked squat of figure, and the short steps he took reminded Carwyke of a fat

goose waddling on the flat. His expectation died suddenly. If that gross individual was the head of this mission in the wilderness, as in all probability he was, then there was nothing to be hoped from him.

Puffing, as if from exertion, the fat man approached the bank, and Carwyke saw that on his round chest hung a silver cross of the kind that lifted itself above the church. Bull saw it too, and gave a grunt of laughing scorn. 'His most holy reverence!'

Carwyke, noting the symbol, had no doubt that Bull was right, and he remarked other signs that supported the conviction. The Indians, crowding forward towards the bank, checked suddenly at an imperious word from the gross one; and, as he waved a fat hand, fell back, and, bunching together, waited the will of their priest. A fellow of influence and power, thought Carwyke, and stared at the huge man who had come to a halt a couple of yards from him. The priest gazed at them for perhaps a couple of seconds, suspicion in his keen eyes; then, in halting English, he asked, 'Where you come from?'

Bull took it on himself to reply. 'There's the boss, yer reverence,' he said, with a jerk of his thumb over his shoulder; 'ask 'im.'

The keen eyes lifted themselves from Carwyke and Bull to Standifer who, rifle in hand, was advancing up the bank, whilst Mardock remained at the foot by the canoe and Norma, whose face was pale and had a grief-stricken look.

'Greeting, Holy Father!' said Standifer.

'Who are you who thus come to Ikorefsky?' asked the priest, plainly suspicious of their intentions.

'We are birds of passage, Father, whom accident has brought this way. We stay an hour, two hours, and then pass on down the river.' For one moment Standifer's dark eyes rested on the triple cross of silver, and then turned to the church, and he continued, 'If I may have a word in private with you, I shall be grateful, for I have need of your priestly services.'

As he heard the words a sharp overwhelming conviction came to Carwyke. Standifer proposed to use this gross priest to his own end, and here, in this church of the wilds, to marry Norma. He started forward angrily; but Standifer, who was watching him with apparent carelessness, thrust the muzzle of his rifle forward, whilst a smile wrinkled his dark face.

'You daren't do it,' cried Carwyke.

'Ah! You understand the good fortune the Holy Father stands for?' answered the other with a light laugh.

'What is this?' asked the priest, staring from one to the other.

'I will explain, Father. A word in your ears.'

Standifer stepped forward and whispered for a moment, and as he did so the priest's fat face betrayed first interest, then amusement, and finally wrinkled with laughter.

'A good jest,' he said. 'I myself——' He broke off and turned as if to go back to the house. 'Come, my son.'

'One moment, Father.'

Again Standifer whispered, and the fat priest nodded and spoke a few sharp words to the Indians; then he waddled off to the house, with Standifer stepping slowly by his side.

'There goes a brace of 'em,' commented Bull cheerfully, and stood watching their progress with amused eyes.

(Continued on page 295.)

THE MONTH: SCIENCE AND ARTS.

HARDENING SOFT TENNIS-BALLS.

TENNIS-BALLS are apt in course of time to lose the air pressure inside them, although the process is a slow one. Those that are constantly in use wear out before they become too soft, but balls which are only occasionally played with are apt to lose their resiliency while the covers are still good. A very ingenious pumping outfit has been devised by means of which soft balls can be made hard again. It consists of a pump similar to that used for bicycle tires, but shorter, and fitted with a needle nozzle instead of the usual flexible connection. In fact, the pump closely resembles a huge hypodermic syringe. The outfit includes an awl, a tube of rubber solution, and a box of French chalk. The *modus operandi* is as follows: Find the plug of rubber inside every ball. If the ball is soft, pinching with the fingers will reveal its position; but should this method fail, float the ball on water, when the weight of the plug will cause the ball to turn until the plug is at the bottom. Having found the plug, pierce it with the awl; then dip the end of the needle into the rubber solution, and slightly withdraw the handle of the pump with the thumb over the air-hole at the top. This procedure sucks a little of the solution into the needle. Thrust the needle through the pierced hole in the plug, and pump as if inflating a bicycle tire until the ball is hard enough. The first stroke of the pump expels the rubber solution, which hangs in a drop on the end of the needle, and effectively closes the hole when the needle is withdrawn. Should any of the rubber solution be left on the cover of the ball around the puncture, a little French chalk will remove the stickiness and obliterate the mark. A small roll of pure rubber is also supplied for patching ordinary rubber balls which have become punctured. The outfits are 'put up' in neat boxes and sold at a very moderate price.

CAR FUEL FOR $6\frac{1}{2}$ D. A GALLON.

Considering the saving in cost that would be effected, it is astonishing that so few attempts have been made to run cars and lorries on paraffin, or even heavier oils, instead of on petrol. Devices for using paraffin have been

available for several years, but they are very little utilised. Some three years ago an apparatus was invented in Italy for using what is known as 'gas-oil' for motor-cars. This derivative of petroleum is an intermediate product between paraffin and the residual oils used for liquid fuel. It is dark brown in colour, but runs freely through carburettor jets. The price is about $6\frac{1}{2}$ d. a gallon. In common with all oils, as distinct from motor spirit, it has to be vaporised by heat before it can be used in the engine cylinders. The essential feature of the Italian apparatus, which is now being made in this country, is a hollow aluminium casting in the form of a shallow inverted U. Each leg of the \cap terminates in a throttle float chamber and jet. The levers on the throttle spindles are coupled together by a rod, and are so set that they open together. One float chamber contains petrol, which is used for starting; the other is connected to the gas-oil tank. From the gas-oil jet the spray is drawn up one leg of the \cap and down the other, to discharge into the induction pipe after passing a main throttle above that for petrol. An internal passage is cast in the curved part of the \cap , terminating at each side in a pipe union. Part of the exhaust is passed through this passage, and the heat from it effectually vaporises the gas-oil on its journey round the curve. A car fitted with this device is started with the main throttle opened to the petrol throttle and closed to that for gas-oil. After the motor has become heated the main throttle is moved, so as to cut off the petrol and to open fully to the gas-oil throttle. The petrol vapour passes direct to the motor without being subjected to heat, this feature being an improvement on some paraffin vaporisers, in which the petrol gas is heated. An extra air valve is fitted to the middle of the \cap and is controlled from the dash-board. This admits a certain amount of cold air according to weather conditions, the power of the motor being increased by keeping down the temperature of the gas to the lowest point at which it will remain vaporised. In any case, the power of the motor is reduced by from 10 to 15 per cent. owing to the expansion of the gas by heat, so that a reduced quantity is drawn into the cylinders, this feature being also present when motors are

run on paraffin. With this apparatus no reduction in the compression is required, as is the case with paraffin, while the gas-oil does not have any detrimental effect upon the lubricating oil in the cranks-case. With heavy commercial vehicles it is claimed that £300 a year can be saved by using gas-oil.

PROPOSED BIG TUNNEL UNDER THE MERSEY.

Owing to its diameter, which greatly exceeds that of any similar structure, the proposed new tunnel under the Mersey between Liverpool and Wallasey is of considerable interest. According to *The Times Trade and Engineering Supplement*, the largest cross-river tunnel yet built is that under the Thames at Rotherhithe, which measures 27 feet in diameter inside. If the scheme suggested in the report to the Merseyside Municipal Co-ordination Committee by Sir Maurice Fitzmaurice and Messrs Basil Mott and John Brodie is carried out, the tunnel under the Mersey will have an internal diameter of no less than 44 feet. With a length of 2400 yards, the main tunnel will have a horizontal partition across the middle, with another near the top, while the lower half will be divided into three parts by two vertical walls. The upper half of the tunnel will accommodate four rows of vehicles, and two lines of tram rails are to be laid in the middle division of the lower half. Ventilation will be effected by exhausting the air above the upper horizontal partition, while fresh air will be introduced through the outer divisions in the lower half of the tunnel. It is proposed that the tunnel shall have a cast-iron shell similar to those of the London tube railways, but lined on the inside with concrete. This construction, being watertight, saves the cost of pumping out water from leakages. At the Liverpool end the tunnel is to divide into two branches: one for heavy vehicles, the other for light traffic and trams. One branch would be the full diameter to accommodate the trams; but the heavy-traffic tunnel would be only 27 ft. 6 in. across. On the Cheshire side two full-diameter branches will be provided, to allow for two sets of trams, one to serve the Birkenhead district, and the other Seacombe and Wallasey. Including the purchase of property, together with parliamentary and legal expenses, the estimated cost of the scheme is £6,400,000. An alternative bridge is estimated to cost £10,555,000.

THE PERFECT CHANGE-SPEED GEAR.

Some readers of *Chambers's Journal* will remember a note on 'Wave Transmission of Power' which appeared in the January number for 1921. This method was invented by Mr George Constantinesco during the War to synchronise the firing of machine-guns on aeroplanes, so that the bullets passed between the blades of the propellers, no fewer than 30,000

machines being fitted with the necessary apparatus. Among other problems which this clever inventor has successfully solved is that of evolving, one might almost say creating, a perfect change-speed gear for cars, locomotives, and other machines. Not only has Mr Constantinesco achieved this almost impossible result, but he has arrived at it by very simple means, while the speed variation is automatic. That is to say, when a car comes to a hill the gear slows down by itself to exactly the speed which will enable the motor to take the car up. The driver has nothing to do in the way of changing gears, while, as the load on the engine remains constant, it runs steadily at the speed for which the throttle is set. This constant load on the motor and the unlimited hill-climbing power conferred by the change-speed gear are so advantageous that on a given car or lorry the same average speed can be maintained by a motor of much smaller capacity than that at present in use. This means a big saving in running cost, lower prices for such vehicles, and much simpler control, the advantages being especially pronounced for motor-buses. For a car, the 'converter,' as Mr Constantinesco prefers to call it, begins with a crank on the motor-shaft, from which a connecting rod gives a reciprocating motion. It ends with two levers, fulcrumed on the propeller-shaft, one projecting upwards, the other hanging down. We will suppose for the moment that these levers are provided with pawls, which engage with the teeth of a ratchet wheel. Connecting rods from the levers meet in a common pivot, and when this pivot is worked to and fro one pawl pushes the ratchet wheel round on the forward stroke, and the other pulls it round in the same direction on the backward stroke, thus giving continuous rotation. The imagination must now be extended to visualise a lever which is connected at the top to the 'common pivot,' while a weight is fixed to the bottom end. The connecting rod from the motor crank is pivoted to the middle of this lever. As described, the arrangement would fall down, so we will assume that the 'common pivot' is hung on a link which can swing from a fixed pivot above. As the motor crank revolves, and moves the middle of the lever to and fro, the weight can swing like a pendulum from the common pivot, which remains stationary; or, the common pivot can swing backwards and forwards, while the weight stands still. If the motor is just 'ticking round,' the weight will swing, the common pivot will remain stationary, and the car will not start. But as the motor is speeded up, it takes more and more force to swing the weight, with the result that it is easier to work the ratchets and drive the car. Readers who cannot imagine this mechanism should make a diagram from the foregoing description. They will then see that the farther the weight swings, the

shorter will be the strokes of the pawls, and the slower the rotation of the shaft. How far the weight will swing depends entirely upon how hard the pawls have to push and pull. During the ascent of a very steep hill the weight would have a big swing, and the shaft would only crawl round, but with immense force. On the level, or on a gentle ascent, the weight would hardly move at all, and the pawls would have their full stroke, driving the car at top speed. In the actual gear the weight is replaced by a flywheel, which does not rotate, but is swung round a few degrees each way by a crankpin, this giving a similar effect in resistance to the weight. Instead of pawls and a ratchet wheel, also, which have backlash before they 'pick up,' clutches are used, that slip easily one way, but grip instantly the other. They are also reversible by moving a lever; the full range of speed is therefore given in the reverse. This 'converter' has been tried on a heavy car with a 6 horse-power motor. With ten men on board, and a four-ton lorry hooked on behind, this car started easily on a steep gradient. For the Diesel locomotive, which is the coming type for our main railway lines, this converter should be invaluable by enabling the engine to start the heaviest train without the employment of slipping clutches or electrical machinery.

FIGHTING ONE DISEASE BY MEANS OF ANOTHER.

The recent report of Professor Robertson, the medical superintendent of the Edinburgh Royal Asylum, gives a striking instance of the way in which a comparatively mild ailment can sometimes be used to combat the ravages of a more deadly disease. He recalls that in the previous year's report attention was directed to the extraordinary diminution, during recent years, in the number of deaths due to general paralysis, and new lines of treatment were then foreshadowed. The problem was to find a second infection powerful enough to delay, or, if possible, to arrest, the advance of the initial disease, and yet not so deadly in itself as to endanger the patient's life. After many experiments, tertian malaria was selected as the infection which best satisfied these two conditions. During the past year important experiments—among the first made in Great Britain—had been conducted along these lines. After an interval varying from eight to thirty-two days all the patients inoculated developed malaria. The disease was allowed to run its course for a certain number of attacks, and then it was arrested. The experiment had now been in progress for ten months, and although that time was too short to place the issue beyond doubt, it might be said with confidence that this method of treatment afforded greater benefit than any which had hitherto been devised. Nine out of twelve patients treated benefited, and the greatest improvement had occurred in those cases in which the remedy

was applied at an early stage. In some cases the improvement which had taken place could only be described as a complete transformation of the person. Though in other cases the improvement was less arresting, it was nevertheless real and tangible. These experiments had opened up a new field of research which must be diligently explored. The results arrived at must be interpreted with caution, for in the course of general paralysis spontaneous remissions often occurred. Continued supervision was therefore necessary until the risk of a relapse had been placed beyond doubt.

A GAS NIGHT-LIGHT.

In several positions in or about a house only a small amount of light is wanted after night-fall, while brilliant night-lights for children would be harmful. Until a few years ago the only way of obtaining a dim light with gas was to use the old-fashioned fishtail burner and turn it down. But these burners were very extravagant in their consumption of gas, while they gave but a poor light when turned up. Several miniature incandescent gas burners have been invented, one or two of which have been described in these notes. Unfortunately all suffer from the comparatively short life of the mantles, and the breaking of the chimneys when these are used. A burner of this type has made its advent recently from which these faults have been eliminated. The main feature of the device is the mounting of an ordinary 'Bijou' inverted mantle on a pivot so that it can be rotated. The mantle is fixed horizontally instead of being inverted, and a burner, which passes only half a foot of gas per hour when turned full on, directs a tiny jet upon its under surface. When a hole appears in the mantle, as happens in from three months to one year, it is given a quarter turn, which presents a new surface to the jet. The light from these burners is ample for small landings and other places where little light is required, while for night-lights they can be turned low without risk of smell. No regulation of the air supply is needed. It is claimed that the apparatus does not waste gas, as most ordinary burners do when turned too fully on, and that it costs on the average only one halfpenny per week. When viewed from the back (in reference to the mantle) the device takes the form of an inverted T. At the upper end of the leg is the pivot for the rotating clip which holds the mantle. A horizontal clip at the lower end, under the mantle, grips the burner, and in this way supports the complete device. The ends of this clip cross each other, so that by pinching them between the finger and thumb the clip is sprung open to pass over the burner. A globe made of special heat-resisting glass surrounds the complete outfit. This is carried by the cross of the T, in which notches engage with a turned-

back edge at the bottom of the globe, and by a projecting finger at the end of the leg beyond the pivot. The globe is nearly spherical, and has a hole at the upper end as well as the one at the bottom. The burner can be screwed into any gas fitting in a few seconds, when all that remains to be done is to clip on the T-piece with the mantle and globe. Made in stout tin and bronzed, this miniature incandescent burner is by no means unsightly.

A NON-SCRATCHING, REPEATING GRAMOPHONE.

The bugbear of the gramophone is the scratching noise made by the needle. Constant efforts have been made to eliminate this feature, and these have met with some measure of success, as will have been gathered from recent notes in these pages on gramophone sound-boxes. Another sound-box has been brought out lately in which the scratching sound is almost inaudible, and both vocal and instrumental music is reproduced with astonishing purity of tone. The diaphragm is made of a special composition which, it is claimed, gives a better tone than mica; but the biggest departure from the usual design of sound-box is the provision of a second diaphragm, behind that which is vibrated by the needle, thereby forming a resonance chamber between the two. This chamber is filled with a special substance which is said to absorb harsh sounds, such as are set up by an old and worn record, and to give exceedingly clear articulation. Another innovation is the mounting on whalebone (instead of on steel springs) of the tiny vibrating arm which holds the needle. We have listened to a record rendered in turn by one of these sound-boxes and by two others of the best-known makes; the reduction in the scratchiness and 'tinniness' with the new sound-box was very noticeable; likewise the improvement in the tone. Other special features of the machine include an improved form of tone-arm, which is hung on a pivot from the top, and therefore involves no obstruction in the sound passage; and a ball-bearing between the tone-arm and the sound-box. We now come to an interesting device which will automatically repeat the whole or any part of a record or stop the machine at the end. In the first place the tone-arm is given a tendency to swing out to the edge of the record by a weight attached to a lever at the back. The arm being hung on a pivot which is almost frictionless, a pull of 4 ounces at a short leverage is enough; this means a side pressure on the needle, but one which is almost imperceptible, and no bad effects have been traced to it. The device which raises the needle and sound-box, and swings out the tone-arm, consists of a rod roughly in line with, and attached under, the arm. This rod is held from moving endways,

but turns freely. At the outer end, under the sound-box, and almost, but not quite, touching it, is a flat wedge. It is easy to understand that if the rod is turned, one side of the wedge will rise and lift the sound-box and the needle. Sliding on the rod, and fixable by a thumb-screw, is a fitting which carries a tiny wheel, the latter being so placed that the turn-table will turn it by friction when the two make contact. As the tone-arm moves towards the centre of the record, this wheel touches the edge of the turn-table sooner or later, according to where it is set. When this happens, the turning of the wheel causes a peg on the edge of the turn-table to engage with it, the effect being partially to rotate the rod, tipping up the wedge, and lifting the sound-box and needle. The impact also causes the tone-arm to swing out. If the needle be placed at the end of the record, and the wheel is set in contact with the turn-table, the device will act automatically when the record is finished. But if it is desired to repeat the whole or part of a record, as is done for dancing, an adjustable stop is set against the tone-arm, with the needle resting on the record where the repetition is to begin, which may be at the commencement of the piece or at any intermediate point. It is obvious that if the needle were dumped down into a groove as the rod and wedge turn back, damage would result. This difficulty is overcome in a very ingenious manner. A fibre link is hung by a screw to one side of the wedge. When this hangs vertically it supports the wedge on the record at such a height that the needle is just clear of the grooves. But the moment the link touches the record it is turned by friction to one side, and the needle is let down comparatively gently into the groove. These gramophones are made up in various forms, but the sound-boxes will fit any machine, and are sold separately for this purpose.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE CAT.

By RICCARDO STEPHENS.

PART I.

'TELL me what it means,' I said.

Mahgoul adjusted his pince-nez, bent forward short-sightedly toward the great stone sealing the tomb, and translated the roughly-cut Arabic characters for my benefit.

"Let the busy man remember that the Cat has claws."

'I don't see,' I objected, 'why a busy man should need to remember that.' And Mahgoul, looking rather worried, and sweating freely, pushed back his tarboosh and wiped his forehead with a vilely scented pocket-handkerchief. He always described himself as 'English 'Varsitee man,' and considered English his strong point.

'In the Universitee of London,' he explained, 'they did not officially teach your idiomatic overmuch. Now, who is it that is busy, but attends mostly to other people's business?'

'Oh! the busybody,' I suggested; 'the meddler.'

'The meddler! That is it,' Mahgoul agreed, beaming on me. 'As my friend Lady Lightbody would say, "Hands off!" That is the meaning.'

'Damn your friend Lady Lightbody!' snarled O'Meara, who was standing a little behind me.

Mahgoul was offended, and glared. 'She is damned already, I think,' he said, 'being an Unbeliever. But with all respect, I would point out that you are an outsider in this thing. I am a salaried employé, also 'Varsitee man. Also, you are not officially here, and no longer in the British army, with leave to damn.'

'Stop bickering, please, both of you!' I said sharply. 'If not—then the desert is wide enough!'

O'Meara frowned at me, and then, shrugging a contemptuous shoulder, lounged off to his own tent, his red hair glinting in the hot sun. Mahgoul, fat, black-haired, and vilely scented, made wide deprecatory gestures, and shuffled away in another direction.

You will know both O'Meara and Mahgoul well enough, I think, when you hear what happened. I am not inclined to label them

myself, but they had joined my party with this testimonial:

'O'Meara,' my friend wrote, 'has lately resigned a commission under pressure. Knowing that during the stress of war we could not be over-particular, you will draw your own conclusions. He knows the district, its dialects, wants to see the tomb, and swears he can help that side-show of yours by finding specimens of the birds you want. He would come, if only for his rations.'

'Mahgoul is a clever devil, who speaks English and knows the desert and its ways. He has studied at London University, he says, and is none the better for it. He's too 'cute to let other folk get the better of you. Use him as dragoman, and kick him if he's impertinent.'

Well, they were not much to my taste. But now, at any rate, I was left alone to the peace of the desert and the tomb. I sprawled there contentedly, in the black shadow of a great rock, in khaki shorts, puttees, and short sleeves; and, tilting my sun-helmet a bit, let my mind wander back for seven years. I felt very young and careless for my age.

Yes, it was seven years ago that I (for reasons which I have told elsewhere and needn't repeat) had brought the mummy here from England and had reburied it. Then the Great War came, and I got a commission. In 1919 I found myself demobbed at Kantara, and asked leave to miss a transport, to see Egypt on my own. To which a harassed transport officer had retorted that I could stay in the God-forsaken country as long as I chose—and forfeit my free passage.

I was now fifty-nine, an M.O., and a bachelor. To satisfy that queer thing called my conscience, I had cheerfully submitted to five long years of discipline, which meant orders from much younger men. Now, I suddenly boiled over with impatience.

'If I get out of khaki this side,' I said to the youngster, 'I shall have ten days less of red tape and impertinence from boys who might be my grandsons. I'll do so!' And I cleared out of Kantara with my indemnity papers in my hand and my nose high in the air.

A few days later, a friend in the Egyptian

service had made things smooth for me, and I had started on a sentimental pilgrimage, to look at the tomb of my particular mummy once more. Now here it was, as quiet as when I had reburied it, and apparently taken charge of by local dignitaries. I need think no more about it.

I stretched myself, looked across the miles of glaring sand, stood up in the black shadow, and decided that a lonely stroll would do me good. I had always had a weakness for sport and natural history, with very little chance of indulging it. There was a certain sand-grouse, or partridge—I didn't know which—that I had shot here before. The skin of my specimen had gone astray in an Alexandria club, and I wanted another. I called to Mudge, my servant, told him to bring me my gun and twenty cartridges, and strolled off alone to the nearest *wady* or ravine. I wanted no company, and took no notice of Mudge's remarks about sunstroke, wandering Arabs, *et cetera*. Mudge, who knew all about the mummy, and disapproved of it exceedingly, had managed somehow to be with me all through the war—lying, wrangling, and probably bribing, if need be. Now he was quickly recovering long-forgotten knowledge of the terms in which the English Tommy impresses his wants on the Eastern mind. I left him to increase that knowledge, with a vague notion that it might be useful, if Mahgoul became absolutely unbearable.

Ten minutes later, I had slid into a *wady*, out of sight and out of mind of the little caravan.

Do you know what a *wady* is? A gully of any length and depth, with sand everywhere, from which—in the Western Desert, at any rate—great masses of volcanic rock rise, of all sizes and eerie shapes. There the jackals hide until night, and there I soon found tracks of the bird I looked for.

The sun was now almost vertical overhead, and the sand too hot for the hand. But I enjoy heat, like the lizards I continually disturbed; and for a mile or so I followed the footprints of this covey in the soft sand up the ravine, past patches of camel-thorn and trailing plants of Dead Sea fruit, with my gun ready, and always expecting to see birds whirr up ahead. At last that happened. There was a noise that at once reminded me of September stubbles at home. Half-a-dozen dove-coloured birds rose twenty yards ahead, and swung up the *wady*. I picked my bird, and dropped it dead among the rocks, but never aimed with my second barrel.

Before I could do that, I felt myself suddenly growing giddy. Everything rocked round me. Big stones seemed moving, and I couldn't keep my feet. There was a rumbling, and my second barrel went off by itself. Something hit me on the head, and I slowly doubled up, concertina fashion, with a vague idea that my gun had burst, or that I had a sunstroke.

II.

I knew nothing more until I found myself lying flat, with my head comfortably cushioned on something soft; and a girl's remarkably pretty, dark face, with a pleasant amount of grave interest shown in it, bent over mine.

Alas! this is no love story. At fifty-nine a sensible man can still highly appreciate a girl's beauty, and in this case it was too obvious to be missed. But, if sensible, he knows that, though no doubt an admirable character, he is not physically attractive. This, madam, cannot aspire to be a love-story—so far, at least, as I am concerned. If I had dreamt for a moment of Paradise and hours, I was quickly awakened.

'Ere!' I heard a familiar voice say, 'that's enough o' this! Ympshi! Etlah! Hurry! Get hup, an' I'll take charge!'

Then I felt my head shifted, and found Mudge bending over me. 'You aren't so pretty!' I muttered, and saw his aggrieved face twist itself into a sour grin. 'What's the matter?' I added.

'A hearthquake, sir,' Mudge explained. 'Didn't I warn you?'

'Not against earthquakes, no!' I said. 'Leave me alone. I'll be right in a minute.' And so I was.

I lay still awhile, with closed eyes, and then found I could stand up. 'How did you find me?' I asked Mudge, testing gingerly and finding myself whole.

'I thought 'twas time for a search-party,' Mudge explained, 'so I followed on your tracks, sir. Then I met that young woman makin' for the camp, and she took charge an' fetched me along.'

'Very decent of her,' I said, and looked round to convey my thanks. But the girl had gone, and the only sign of her was a flicker of blue robe between the rocks, far up the *wady*. 'Why the devil did you let her go?' I asked angrily. 'Fetch her back!'

But Mudge, obstinate as usual, very respectfully (for him) expressed his firm belief that his 'dooty' called him to stand by me. And before I could pull myself properly together and give the order firmly, the blue robe was clean out of sight.

I was vexed; but by the time Mudge helped me back to camp there was something else to think about. The earthquake had hardly disturbed our tents on the sand, but it had shifted the big stone from the mouth of the tomb.

When we reached it, a little crowd of camp-followers and stray Arabs hung about the opening, scowling and chattering angrily to one another. Inside were O'Meara and Mahgoul, wrangling fiercely, and apparently on the verge of a scuffle. Between them lay the mummy, with some of its wrappings torn away.

I am a timid man, and also a peace-lover, as befits my years and my profession. But the

hot temper which has so often got me into trouble and left me there, drove me into that tomb headlong, and the two fellows were out of it before they quite knew what was happening. When O'Meara turned upon me, I told him what I thought of him and his conduct in terms I'd rather not repeat. Then I myself straightened the mummy's wrappings as well as I could; and got surprisingly willing help from the natives to lift it into place and to close the tomb again, with the Arabic characters still clear upon the stone: 'Let the meddler remember that the Cat has claws.'

Some accident, some coincidence—I learnt later—had given the tomb a wonderful reputation. It had become quite a holy spot, and pilgrimages were made to it for various purposes. It seemed to me afterwards that, while concentrated on getting O'Meara and Mahgoul out of the place, I had half-seen, among many angry faces, one of scornful hate, such as Medusa might have shown, above a blue robe.

But when I had time to look again, it had gone. I put it down to my imagination, and was too busy to watch for it. The work of reclosing the tomb was heavy, and it was only finished at dusk. O'Meara and Mahgoul, I believe, sulked in their tents all that evening. I, at any rate, neither sent for them nor saw them.

I confess to a feeling of surprise, after consideration, at the ease with which I had got those two fellows away from the mummy. Mahgoul, of course, was a coward anyway. But O'Meara! A fighting, red-headed Irishman! I suddenly began to wonder if he went quickly because something went with him that he thought worth keeping.

III.

I am no seismologist. I don't know, in fact, whether rain may be expected quickly after an earthquake, or whether a following storm is a mere coincidence. At any rate, the storm came.

I had failed to find the bird that fell just before the earthquake, and the next morning I thought myself quite fit to try for another. I may say at once that Fate seemed dead against me, and the Natural History Museum is still without a specimen.

But that morning I determined to try for one, and, after consideration, I invited O'Meara to come with me. As a companion, O'Meara was most decidedly uncongenial. Better solitude, better Mudge, better anybody than O'Meara—except perhaps Mahgoul.

But I didn't care to leave the two in camp together; and Mahgoul, who usually appeared either in heel-less slippers or else in high-heeled, elastic-sided boots, was hopeless for a desert tramp. Besides, there was my suspicion that O'Meara had not come quite empty-handed out of the tomb. I thought I might sound him

carefully on that point, when away from camp. For I didn't much like taxing a white man with petty theft in front of an Egyptian. In that attempt, too, I was to fail—and, indeed, had little chance to make it.

We took lunch in our haversacks, and started directly after an early breakfast. As we left, I noticed men busy at the tent pegs and weighting down the canvas with stones. On asking, I was told they were getting ready for possible bad weather. But bad weather in April seemed impossible. I saw no sign of it, and we tramped away to a particular *wady* a short four miles off, where birds were reported to have been seen, and where O'Meara, who seemed anxious to conciliate me, said he could find them.

'If there's a storm, we'll find shelter,' I told Mudge. 'It couldn't last long at this time of the year.'

Well, we tramped the dust-dry bed of this *wady* uselessly, and searched the two next with no result. Tracks there were, often, and many quite fresh. But either the birds kept on the run just ahead—and partridges *can* run!—or else they cowered among the stones and, stone-still themselves, were passed unnoticed. Anyway, we found none; and, walking some forty yards apart, we did no talking about tombs or anything else. Then the storm came.

First I found myself panting unusually and feeling the heat particularly oppressive. Then I looked at my wrist-watch, thinking it must be late in the day, as the light had grown so bad. Then came a few splashing, heavy drops, and then, as I shouted to O'Meara and climbed for shelter to a tiny cave that I saw, down came the deluge. It seemed to me as though I were in a gigantic shower-bath, or as if a celestial cistern had burst. In a few minutes the sky was so dark that one could see only a few yards away, and obviously it was impossible to make for the camp. As for the rain, when the sheets of it struck the sand, the sound was like that of an army of phantom drummers. We could not hear one another speak. There was no escape from it. We peered at one another, and grinned morosely, a little more sympathetic through being unlucky together.

At the nearest port, over a hundred miles away, I was told, months later, that on that particular afternoon nearly five inches of rain fell in five hours. With us, we simply knew at the moment that it was like a second Deluge. We were out of the storm, anyway, where we were, and we lit our pipes and waited patiently. O'Meara's red head poked out once or twice, and was hurriedly pulled in again. For my part, I watched the sheets of water come down, and found it dull enough. But I did not care much, so long as my 'baccy lasted. However, it was not to be dull long.

By this time the vast plateau above us, dry as it was, had become saturated, and water in

sandy streams began to pour down the steep *wady*. Every few minutes I saw little streams join from all sides to swell the flood. Bushes came down, then lightly-rooted trees. Small stones shifted, and then came a bundle of sodden blue drapery, from which a hand tossed, rolling over and over down to us.

The water now ran only some three or four feet below our little cave. I was staring up the *wady*, and saw the thing coming. The drapery was caught for a few seconds on a rock, and that gave me time to yell to O'Meara, and to scramble down. As the bundle came rolling on, I waded in and clutched at it, and O'Meara clutched me. In a few seconds we had dragged an insensible Bedouin girl into the little hole where we sheltered—and it was the blue-robed girl who had escaped me the day before.

IV.

I don't know the length of the next act of this little drama. When one is fighting for a life, one takes no count of time. I only know that I seemed to be working for a lifetime at that child—for to me she looked nothing more—before I saw any hope of her recovery.

I had time, at any rate, to see that a very charming face lay like a mask before me. Long black lashes and half-closed lids hid the eyes. The paleness of death was on cheek and lip; but the straight black eyebrows, the broad forehead, the delicate aquiline nose, and the firm rounded chin were all the more noticeable for her waxy pallor. The lips were set, and the strong white teeth clenched; and I used force to part them.

In listening—uselessly at first—for any heart-beat, I noticed one thing conspicuously. On her breast was tattooed some mark, probably tribal, which I had no time to examine closely.

All these things were noted subconsciously. It wasn't until later that I remembered that I had seen them. I fought for a life—no matter whose, or of what value. A purely professional instinct; for I remember wondering vaguely, while I worked at her, whether such a life was really of any particular value. That, you will exclaim, isn't the correct attitude for a medical man. Of course it isn't! Were I 'correct,' I, with my simple tastes, would die a rich man. As it is, no one will be appreciably the richer when I depart this life.

But the girl came round at last, for which, I suppose—whether unfortunate or no—I must be held responsible.

Her blood slowly circulated again, showing a dark red flush under an olive skin. Her lips pouted, full and red. A pair of dark, melancholy, questioning brown eyes showed themselves under lifted lids—and a very attractive maiden, after staring vaguely at us, suddenly tried to sit up, sank back helplessly, and drew a wet corner of a torn and bedraggled veil across

her face. I think she recognised both of us at that moment. Now I suddenly found that the storm was over. The torrent was sinking, the sun was out, and the desert steaming like a hot sponge.

'Ask the child where we shall take her,' I said. But the girl shook her head to the question. Her people, she told O'Meara, were on the move, and she had strayed to find a wandering goat. We lifted the girl between us, and, with many halts by the way, carried her back to my camp.

That evening both O'Meara and Mahgoul questioned her, and seemed to me to take an unnecessary time about it, and to be remarkably jealous of one another's attention. I finally stopped their interrogations impatiently, and told Mudge to have a tent put up for the girl near his and mine.

Mudge had watched from afar, in a detached, disapproving way with which I was quite familiar. Later, when I had bathed and was changing for my evening meal, I asked him what was the matter. 'You don't want me,' I asked fretfully, 'to turn the child loose on the desert for the night, do you, after what she did for me, and after pulling her round just now?'

'It's my belief she could find 'er way 'ome if you did, sir,' says Mudge; 'at least, to as much of a 'ome as these gipsies 'ave got. Searchin' for a goat, was she? Well, I think she's found two; anyway, I saw that blue nightie or dressin'-gown of 'ers in the crowd when 'er two admirers was lootin' the tomb—which they wouldn't ha' done if they knew that blarsted mummy—('scuse me, sir)—as well as you an' I do. She was flittin' about this mornin' before you were up, and it's my belief she followed you.'

'And got washed down the *wady* on purpose, I suppose,' I suggested. 'But look here, Mudge, what do you mean by "looting"?''

'Well, sir,' said Mudge doggedly, 'if you ask me, I'd swear one of those two Hegyptologists pinched something. That's what they was near scrappin' over—an' I think O'Meara—(I beg your pardon, sir; Captain O'Meara, I should say)—'as got it. Pretty "Captain"! I fancy the natives thinks so too.' But by that time I was dressed, and sent him off to order up my dinner.

(Continued on page 310.)

TINKER-TIME.

WHEN tinkers go, without relief
Rains flood the stream with tears of grief;
Sad leaves take wings; no birds will house;
The wind calls loud through beckoning boughs;
Dark trees for months their mourning show—
Sad is the wood when tinkers go.

In spring, when tinker-folk arrive,
Sudden the dead trees start alive;
Love-soft becomes the earth's hard breast;
No bird but straight must sing and nest;
The stream shouts loud its welcoming
When tinker-folk arrive in spring.

ETHEL TALBOT.

IN A PALESTINE PORT.

By L. GORDON GRANT.

I.

SO accustomed are we to think of Palestine as the land of Bible stories, that we seldom pause to consider what it is in modern times; yet it is a land over which there hangs an alluring glamour, and to-day, as of old, it is a land of promise. Since Britain undertook the responsibility of holding a mandate for this old, old land, new blood has flowed into sluggish veins, and the deadly torpor, which is the result of tyrannical oppression, is being slowly shaken off. Life is quickening, as it always does quicken when freedom, not subjection, is the badge of a people. Palestine is the gateway to the languorous East; it is also the doorway to the virile West. It retains much of the indolent grace—and filth—of the East; it is daily being inspired by the infusion of Western thought and culture. And thus we find a curious blending of the old and the new, of the ancient and the modern. Not all of the former is bad; nor is all of the latter good.

Sitting this February afternoon, in the genial spring-time sunshine, on the slopes of Mount Carmel, I see below me the rich culture of the plain that sweeps from the base of the mountain to the edge of the sea. But a few years ago, when victorious British troops marched into Haifa, this plain was a dreary uneconomic marsh. Undismayed zeal and indomitable energy have transformed it into productive arable land; and to-day a fascinating dapple of rich brown and luscious green presents an aspect of splendid agricultural promise.

Beyond the fringe of the plain stands Old Haifa, with its cemetery, where lie, in dignified and honoured repose, not a few of Britain's gallant soldier sons who fell in the last crusade to the Holy Land. Hard by their graves, in the bowels of the earth, is an ancient tomb which contained all that was mortal of their mediæval predecessors, who likewise perished nobly in their valiant struggle to win for Christendom the holy places that cradled their common faith. Descending into the tomb by a flight of stone steps, we find ourselves in a sunken roofless chamber, with Norman arches supported on much-weathered round pillars with cushion capitals. On one wall remain faint vestiges of what, doubtless, were the painted effigies of those who found sepulture within the small chambers that open off the central hall. In each of these there seem to have been three sarcophagi, but in one there is the greater magnificence of a tessellated floor, and the remains of a narrow stone table. Probably this was a small chapel, in which the

bodies of the dead rested on the stone ledge before entombment took place. Alas! to-day the place is in a state of incredible filth; it is used as a poultry house and donkey stable, and the stone ledge has been transformed into a manger. One fragment of a stone door we saw lying on the ground of this chamber; on one side it had the rude carving of a lotus-flower, but that was as near as we came to the riches of a Tutankhamen tomb.

II.

Beyond Old Haifa, sweeps with calm, unruffled breast, into the Bay of Acre, the blue Mediterranean. Right opposite, on the other side of the bay, glistening like a pearl in a sapphire setting with shining sand-like bands of gold on either side of it, stands the ancient fortress of Acre itself. What scenes of knightly splendour the very name conjures up! What glorious names of chivalry come to mind! Baldwin, and Philip, and Richard of the Lion Heart; Saladin and Khalil; the great masters of the Hospital, of the Temple, and of the Teutonic Orders, all range themselves before our vision. The mighty throng of armed crusaders, the silken tents of royal leaders, the furling banners of western nations, all the panoply of war unfold themselves before us, and once again we are plunged into the very midst of the Middle Ages, listening with eager ear to the clash of arms and the rattle of the tourney. But, alas! the hands of time have moved far since these things happened; even Napoleon, Ibrahim Pasha, and Sir Sidney Smith seem far away; and Acre to-day is but a shell, round which cling the brave tales of high romance of the days of long ago, and the ever-prevalent smells of an eastern town.

Beyond the plain, which encircles Acre on the north, rise the Galilean hills, dominated by the glittering distant peaks of mighty snow-clad Hermon.

On the placid waters of the spacious bay proudly ride the argosies of commerce, laden with the merchandise of the world. In their midst, like a giant amongst pigmies, an Atlantic leviathan, the *Homerick*, rears its huge bulk; but suites of apartments on a floating palace, which cost a thousand pounds apiece, or even a single state-room, which runs one into many hundreds, are within the reach of only the richest of the sons of the earth. Tiny boats gently sway on the softly heaving waters, and busy barges ply from unloading merchantmen to the congested quays. The shrill whistle of a railway engine introduces a modern note, and a long train, like a fussy snake, crawls along the sea-shore. But the persistent East asserts

itself anew; the musical tinkle of a bell announces the passage of a string of laden camels on the road below, and the discordant bray of a disgruntled donkey emphasises the fact that, in spite of Atlantic liners and railway trains, we are still in the Orient.

III.

Beneath our perch, on the sloping road that leads to the top of Carmel, we espy a corpulent Carmelite friar astride a diminutive donkey, sitting almost on its tail. He is making for the monastery at the top of the slope, where a beautiful chapel stands. Under the gorgeous high altar is the grotto wherein the prophet Elijah sought shelter. One of the ladies of our party, unmindful of the Scripture story, demands of our gentle guide-monk, 'And is this really where Elijah is buried?' 'Ah, no!' comes the mildly reproving answer; 'Madame forgets. Elijah did not die.' And so, discomfited, we beat a rapid retreat, to purchase some of the mother-of-pearl or olive-stone rosaries which are procurable, at infinitesimal cost, at the door of the monastery. Emerging from this sanctuary of peace and proceeding along the road on the top of the mountain, we are soon confronted by a grim reminder of the devastating horror of war, in the shape of a huge German gun that was mounted to protect Haifa from the hostile raids of any marauding British host. By a grim jest of fortune not only was the gun used but once—to fire on a regiment of Indian troops marching across the sea-shore from Acre—but Carmel itself ultimately became Lord Allenby's headquarters. All around is the government's forest reserve, and our Scottish hearts warm to the young firs and the baby pines. Flaunting poppies splash, with vivid scarlet, the green hillside, and mingle with shy anemones, delicate cyclamen, tiny celandines, and a hundred and one other blossoms of the wild, whose names are unknown to us. A blaze of golden glory bursts on our view, and we recognise a clump of gorse in full bloom. Our feet sink into a carpet of red clover, which is in sharp contrast to the solitary survivor of a neighbouring bed of narcissi. The shrill notes of a reed pipe hurry us back to Bible times, and we turn to watch a picturesque shepherd scrambling over the hillside after his straggling flock with its bell-wether, in the midst of which are a few shaggy, black goats, butting their way along in the upward march. Such scenes are familiar in Palestine, and are the same to-day as they were two thousand years ago.

Carmel is not really a mountain. It is a ridge, which continues from the sea in a southeasterly direction for about fifteen miles, when it abruptly thrusts its huge shoulder into the plain of Esdraelon, that cockpit of war from Barak to Allenby. Incidentally, travellers across

the plain are constantly confronted by sinister relics of the British army's triumphant march across Palestine, in the shape of abandoned waggons, which lie derelict on either side of the road.

IV.

But our way leads us to the town again, and in descending the hill we pass on the left below us the tomb of Sir Abdul Baha Abbas, the son of Baha-Ullah, who succeeded the Bâb, and founded the religious sect known as the Bahai. Sir Abdul Baha Abbas was born on the very day that the Bâb proclaimed his message at Tabriz, and he accompanied into exile his father and his devoted band of followers, during the whole period that they were held in captivity by the Sultan Abdul-Hamid. He cheerfully shared the rigours of incarceration in Acre fortress, and in 1892, on the death of his father, became the leader of the movement. Some twelve or thirteen years ago he emerged from his eastern seclusion, and journeyed to Paris and London. In the latter city, on the invitation of the Rev. R. J. Campbell, he spoke to a large congregation in the City Temple, and, before leaving, inscribed in Persian characters on the fly-leaf of the pulpit Bible a characteristic message. Archdeacon Wilberforce, that broad-minded churchman, also made him free of the pulpit of St John's, Westminster. But the Bahai story cannot be told here: it requires, and deserves, a special article to itself.

Continuing on our way, we pass clumps of dusty-looking olives, denuded of fruit, while pathetic fig-trees, devoid of foliage, stretch out imploring arms to the blue skies. Thick firs, with clustering cones, mingle with the spiked tops of lofty cypresses; and stately almonds, in full bloom, stand like shy brides in marriage finery. Plunging into the old town, we wander through the narrow streets of the *Suk*; but the rather mean and squalid bazaars have but little attraction for those who have seen the splendours of Damascus, or the rich merchandise of Cairo. Strings of supercilious camels stride along with stately tread; pattering donkeys barge their way through the crowded alleys; and languid merchants squat by their booths, smoking the eternal hubble-bubble. Passing the post-office on the right, and the busy quays on the left, we emerge on the Nazareth road. There below us on the sea-shore is a grove of palms, behind which slowly meanders, across the plain to the sea, the ancient stream of Kishon. A noisy motor scrambles past, scattering in its headlong flight a flock of startled sheep, and once again East and West are in conjunction.

V.

Looking across the sparkling blue waters of the bay from this point, one cannot fail to be

impressed by the magnificence of its possibilities. It is the only natural harbour on the whole Palestine coast, and if a mole were run out from Acre, and another from Carmel Point, across the ten miles of intervening sea, safe anchorage could be found for the massed fleets of the world, and a valuable naval-base established for the protection of British interests in the Mediterranean and the Near East. Haifa, moreover, is the headquarters of the railway system which links up Palestine with Egypt, and connects the littoral with Damascus and Arabia. Years ago Sir William Willcocks wrote of the immense potential wealth of the regions round the Tigris and the Euphrates. If this wealth were developed, much of it could be run over an extended railway system and embarked at Haifa. A line has already been surveyed as far as Baghdad, and no engineering difficulties have been found to exist. Lack of capital is certainly one of the factors which at present prevent the completion of a scheme which would bring the markets of Persia and Afghanistan into direct and rapid communication with Europe. Political and international considerations may also be matters interfering with the carrying out of the project; and whether the advantage of having an alternative (overland) route to India is not outweighed by disadvantages is a matter for experts to settle. Considering the present attitude of the British taxpayer to affairs in the Near East generally,

one would require to be a confirmed optimist to entertain any hope of British public funds being supplied for such developments, even if France, the mandatory for Syria, expressed approval and agreement.

Rumours are rife of pipes being laid from the rich oil-fields of Mosul to the coast, and assuredly no place is more suitable for their reception than Haifa. But greatly extended harbour accommodation would be required, for Haifa sadly lacks good harbour accommodation. The local press has announced that Mr Palmer, an English engineer, has come out to confer with and to advise the Palestinian Government on that important matter.

A town-planning scheme, drawn up by Professor Patrick Geddes (who has just completed another scheme for the improvement of Tiberias), is under way, and under it much of the congested old town of Haifa will gradually disappear. Schemes for improved lighting, draining, and a better water-supply are under consideration. The last-mentioned is much to be desired, for at present the inhabitants are dependent on cisterns or wells which produce water of a disagreeable salinity, though springs of the purest and freshest quality are known to exist on Carmel.

Under wise, enlightened, and courageous administration, there is no town in Palestine that has rosier prospects of phenomenal success than has Haifa.

A GIPSY OF THE NORTH.

CHAPTER XIII.—continued.

CARWYKE, now utterly convinced that there was nothing to be expected from the priest, turned sideways and looked down the river bank. The peril for Norma had increased a thousandfold in the last few minutes. Here, in this native village, with a corrupt priest at the head of it, and with Indians to yield him slavish obedience, anything might happen; and if the girl was to be saved from the fate which had become so unexpectedly imminent, he must act swiftly.

Norma, as he noted, was still seated in the canoe, which was half awash. Her eyes were turned disconsolately up the river, as if she had no interest in what was happening on the bank; and it was easy to guess that she was thinking of Eskimo Billy, lying cold and silent at the forest's edge. Mardock, with his rifle butt resting on the sand, was staring at the Indians speculatively, his attitude one of careless interest. It would be possible by a single spring to reach him and knock him into the

water, then to push off the canoe and join Norma.

Scarcely had the plan come to him when he leapt, and the force of his leap swept the surprised Mardock off his feet into the river. He cried a warning to Norma, and already had his hands on the gunwale of the canoe for the push that would have sent it out into the current, when a heavy body fell upon him, and he himself was crushed face down into the wet mud, with a pair of sinewy hands about his neck. He struggled to free himself. He heard Norma cry out, and then other hands gripped him; the man kneeling on his shoulders rolled off, and a second later he was dragged to his feet, two of the natives holding him by his arms. Mardock, dripping from his involuntary bath, was already standing on the bank, whilst Norma stared with fear-stricken eyes.

Realising his helplessness, Carwyke ceased to struggle, but his captors kept their hold on him; and as he looked round, he met Mardock's

eyes. The man gave a laugh that had in it not a trace of resentment.

'Too bad, Carwyke!' he said affably. 'If Standifer hadn't foreseen some such event, you might have pulled it off.'

Carwyke, overcome with chagrin at his failure, made no reply; but he looked at the other wonderingly. There was something in the man's attitude that he could not understand. Mardock, as it seemed to him, whilst he would not stoop to active disloyalty to his friend, had little sympathy with his nefarious purpose, and was not against its being thwarted, provided he himself was not called upon to assist.

Carwyke's eyes turned to Norma, and as he read the concern in her face, he spoke. 'Whatever Standifer tries to force you to, resist.'

He could say no more, for at that moment the natives thrust him up the bank, where he found Bull still standing, but now with a number of natives around him, two of whom were armed with ancient muzzle-loading guns.

'Look at the swine,' he burst out as Carwyke was thrust into the circle. 'If I'd anythin' besides my two hands, I'd spifficate the lot.'

The other made no reply, and a few seconds later Bull spoke again. 'Here comes his reverence an' Standifer. I'd give a dollar to know what's goin' ter happen now.'

Carwyke looked towards the house. The priest, with a fat hand upon Standifer's arm, was waddling towards them once more, and it was clear that they were on the best of terms.

'The fat an' the thin,' commented Bull contemptuously. 'But, for all that, they might be blood-brothers.'

As Standifer drew near he looked at the prospector with eyes that were smilingly malicious. 'My play now,' he said. 'And I mate with the Church.'

Carwyke's impulse was to fling himself upon the scoundrel and choke the life out of him rather than let him triumph, as he had resolved to do coming down the river; but with the dark faces ringing round him, he knew that would be impossible, and he restrained himself.

Standifer laughed as he spoke again. 'I should have liked you to give the bride away, since you brought her to me. But I fear that is impossible. You shall, however, share the wedding-meats—in whatever calaboose this little burg can provide!'

The priest, still with his hand on the scoundrel's arm, spoke some words in a native dialect; and a second later the Indians flung themselves on the two men. To struggle was impossible, and in any case against such numbers would have been quite useless, and they were borne towards the house in the shadow of the church with its triple cross, Bull swearing roundly as they went. When they reached the house, they were taken to the rear, where stood a small structure of logs with a padlocked

door. One of the Indians opened the door, the rest thrust the prisoners inside, and next instant the door was closed. Through Bull's rumbling oaths, Carwyke caught the grating of the key in the padlock.

The place was windowless and in complete darkness, except for the very little light that streamed through the chink above the door. After standing for a moment uncertain what to do, Carwyke felt his way to the wall and leaned against it. Just as he did so he heard Bull move and then stumble over something. An oath followed, and then there came a scraping sound, and a moment later a match kindled. By its feeble light Carwyke saw his companion standing looking at the thing over which he had fallen, which was a sledge, and perceived three other sleds reared against the wall, with a quantity of steel traps piled in a corner. He had just time to see so much, when the match went out. Bull struck another, and whilst it was burning the prospector lowered one of the three sleds to the floor and seated himself upon it, whereat Bull laughed.

'Good idea!' he said, and himself sat down on the sled over which he had stumbled. He lifted the still burning match to get a glimpse of Carwyke's face, then said lugubriously, 'Here's a durned mess! Standifer's fairly put the kybosh on us this time. We might as well be in Sing-Sing as in this cub-hole.'

Carwyke shared the fellow's thought, though he did not say so. A cabin, built as this was of logs, was wonderfully strong, as he knew, and with naked hands they could do nothing to deliver themselves. He was almost in despair. Norma was now helpless in Standifer's hands, with no one to oppose his will, unless Mardock should choose to figure in that rôle, which did not seem very likely. The fat priest was friendly disposed to Standifer, and the latter would, no doubt, prevail upon him to do what he wished; already the scoundrel was counting upon that. The villain's last words showed what his immediate intention was, and only Norma's will lay between her and the fate from which she had fled when they had left Unapik. That Standifer would be ruthless in his methods to break down the girl's opposition he was sure, and he groaned aloud as he thought of his own helplessness to aid her.

Then out of the darkness came Bull's voice. 'What's hurtin' ye, Mr Carwyke? Did them coppery devils stick ye?'

'Standifer means to marry the girl here.'

'Jumpin' Methuselah! I never tumbled ter that. An' that fat priest'll do it for him as easy as winkin'.'

'Yes! He has scoundrel written all over him.'

Bull whistled softly to himself for a moment, then he laughed lugubriously. 'Standifer has nerve enough ter ask us ter stand witnesses for

him, whilst Mardock will give the bride away. He's a fair corker, that feller, an' this blubbery priest is what ye might call a gift ter him.' He laughed again, and added, 'We're fairly out of the game now, and I wonder if Standifer'll leave us here when he departs on his weddin' tower?'

'I should think that is very likely.'

Bull again fell to whistling, but broke off to

say, 'If he don't, then, by Gar, we begin a new game!'

'What do you mean?'

'Mean!' This time the man's voice had a savage note. 'I mean that before that girl hits civilisation I'll make her a widow. Standifer ain't going ter get away with this, whilst I've a kick in my toes.'

(Continued on page 315.)

POTEEEN.

By JOHN McCaffrey.

IN Ireland the manufacture of the illicit spirit known as 'poteen' has always been a thriving trade. The Government made many attempts to stamp out this iniquitous industry; however, in spite of frequent police, military, and Excise raids on the haunts of the distillers, the quantities of poteen manufactured underwent no appreciable change. In fact, for a considerable number of years half the quantity of spirit consumed in Ireland was sold free of duty. This, of course, had a very serious effect on the revenue receipts from Excise. The authorities became alarmed, and a special body of armed revenue police was formed for the suppression of the poteen-makers. But it soon became evident that many members of this force, which was ironically known as the 'Poteen Hussars,' were in collusion with the manufacturers of the 'mountain dew.' The Revenue Police were consequently merged with the Royal Irish Constabulary on 1st October 1857. The Government granted the police special allowances when engaged on poteen hunts. Liberal rewards were also made when stills were captured and convictions secured. Thus encouraged, the police were active in raiding the bogs and the mountains for the secret distilleries. The number of prosecutions steadily mounted, and in one year 3500 seizures were made. In 1901 the rewards were discontinued, but even in that year 2000 cases of illicit distillation were reported.

The lonely islands on the western seaboard, the dreary wastes of bog and the desolate mountain fastnesses of the west and the north-west are eminently suitable for the manufacture of poteen. In these secluded places the distillers can work without fear of interruption. Many of the sites for the stills are almost inaccessible. Moreover, unless an informer gives the police information of the exact location of the distilleries, they cannot possibly be detected, so skilful are the peasants in the art of camouflage. Caves and dug-outs in the hill-sides and bogs have been used as distilleries for many years. Furthermore, the poteen-makers have always their scouts posted in positions where they can observe and give

timely warning of the approach of the police or Excise officers.

However, in recent years a few poteen-makers actually had the temerity to distil poteen in residential districts in Belfast. In another notorious case a courageous fellow started operations in a house adjoining a police barracks. But it was not long before the police smelt a rat, or, rather, the characteristic 'bouquet' of poteen.

Failing in the task of suppressing the traffic by surprise raids and seizures, the authorities endeavoured to circumvent the illicit distillers by making it a difficult matter to secure the necessary utensils for manufacturing spirits. Accordingly it was enacted that 'stills, still-heads, or worms are not allowed to be removed from one part of the country to another without a permit granted by an officer of Customs and Excise. The permit must contain the name of the brazier or manufacturer or person selling the still, and of the person to whom and the place to which the same is intended to be sent, and the content in gallons of such still and still-head respectively. Any still, still-head, or worm found in course of removal without a permit is subject to forfeiture, and the person sending the same is liable to a penalty of £100.' However, this enactment had little, if any, effect on the poteen-makers. It did, of course, make it very difficult to secure proper stills. But tinkers, or itinerant tinsmiths, as they called themselves, were always available to make stills and worms for a 'consideration.'

The manufacturing plant in these poteen distilleries is usually of the most primitive description. The mashing and fermenting operations are carried on in large tubs or barrels. The still must, however, be made from the very best copper. Defective stills have been the cause of some very bad accidents. The bottoms of the stills have a tendency to sag, owing to the great heat to which they are subjected; and if there is not time to withdraw the fires, an explosion is inevitable. The worm in which the spirit is condensed after it leaves the still in the form of vapour is also, as a rule, made from coils of

copper. The vessels which receive the spirit are usually dairy cans. Indeed it often happened that the poteen spirit was carried from the distilleries past police barracks in these innocent-looking receptacles. My father told me that on one occasion during a holiday in Ulster he spent an evening with some friends watching the manufacture of poteen in a hut on a mountain in County Fermanagh. Most of the distillers were local farmers, who did not like drinking expensive public-house whisky when they could make their own 'hard stuff' on the hills for next to nothing. I believe that it was a picturesque sight to see the wash bubbling in the still, which was suspended over a large peat fire. There was also a delightful aroma of alcohol in the cheerful little kitchen.

Some years ago in many parts of the country the small farmers and the peasantry cultivated oats and barley exclusively for the manufacture of poteen. A considerable proportion of the barley was malted in the orthodox manner. Poteen made from a mash consisting of malt, barley, and oats compared very favourably with the finest whiskies of the best distilleries. When the distillers did not fear detection they redistilled the 'low wines,' as the first product of distillation is termed. But, generally, the poteen-makers were pressed for time, owing to the danger of detection by the Excise officers and the Royal Irish Constabulary. Consequently, very little attention could be paid to those technical details which mean such a lot to the distiller who wishes to produce good spirits. Frequently, indeed, fermentation and other processes were not allowed to take their natural course on account of the difficulty of obtaining supplies of yeast. The absence of scientific instruments for testing the specific gravity of the wash and the strength of the spirits also seriously handicapped the poteen-makers. Therefore, it often happened that when the spirit was collected from the still its strength was about 50 per cent. under-proof. In other words, it was at least 20 per cent. weaker than the strength of retail whisky. While very weak in strength, the poteen possessed various properties which were the reverse of agreeable. It contained a large proportion of fusel-oil; it had a raw, fiery, nauseous flavour, and its bouquet was unpleasant. If consumed, as it usually was, shortly after distillation, it was very intoxicating in its effects.

But there were certain secluded districts in Ireland where the poteen-makers could devote considerable attention to the details of manufacture. In these favoured places, properly-equipped stills produced excellent spirit, which was redistilled until it was practically pure. This spirit was placed in sound oak casks, which were buried in the bogs in order to mature rapidly. It is questionable if this form of

maturing spirits has any advantage over the orthodox methods. It has, however, the effect of rapidly reducing the distilled strength of the spirit, thus rendering it milder in flavour. In the old days the country gentry did not scruple to store poteen in their cellars. Since it was allowed to mature for several years, it compared very favourably with popular brands of whisky. The following extract from Inspector Garrow Green's interesting book, *In the Royal Irish Constabulary*, throws an interesting light on Irish life some years ago:

'Poteen is usually buried in the earth in small-sized vessels. This is done for the double purpose of improving the spirit and concealment. If found in a dwelling-house, the owner is liable to a penalty of £100, notwithstanding which, there are few gentlemen in this part of Connaught who are not well supplied with the contraband liquor. I first tasted it at the table of a magistrate and master of hounds. The local doctor, with whom I was intimate, and myself dined with him one evening, and on the sideboard I perceived several decanters of colourless spirit of which I had my suspicions, having only the day before been engaged in a fruitless still-hunting expedition.

'I gently made these known to my friend the doctor, and expressed a wish to know what it was like, the seal of hospitality, of course, being a safeguard for our host. The doctor told him that I would like to try the *white* whisky. "Oh, the Scotch," he replied cautiously. "I really think you would find the Irish here much better." An exchange of masonic signs, however, with my companion reassured him, and I was presented with a glass of the very best "barley." What an aromatic, peaty flavour it had, and a consistency almost like a liqueur, not thin like the legal article. It was a brew of the purest and slightly overproof, as I had abundant proof of next morning, not being addicted to strong waters.'

During the last twenty years most of the poteen made in Ireland was distilled from treacle or molasses. Poteen made from molasses can be distilled in forty-eight hours, and with comparatively little trouble. It is, therefore, very popular with the poteen-makers who want quick results. Incidentally, molasses could be obtained free of duty by farmers who certified that the stuff was required for cattle-feeding purposes. In this way they experienced very little trouble in obtaining comparatively large supplies for poteen-making. The Excise officers were required to satisfy themselves that the supplies delivered duty-free were legitimately used. The farmers were, of course, always able to assure the officials that the law was respected!

When war restrictions were imposed on the distillation and sale of spirits, poteen-making received a fresh impetus in Ireland. In some parts of the country it was impossible to obtain

supplies of the legal article. The poteen-makers took advantage of the scarcity by manufacturing enormous quantities. Agents were actually appointed to negotiate the sale of poteen with the licensed trade. Some retailers refused to purchase the contraband spirit. But there were many who succumbed to the temptation. Wages were high, and there was a big demand for any description of alcohol. The poteen-makers demanded £2, 10s. per gallon for spirit distilled from malt, but spirit made from molasses was £1 cheaper per gallon. The retailers did not sell this spirit as poteen. They mixed it with genuine whisky or rum. This practice was partly responsible for the outcry against the poor war-time quality of many famous brands. Again, poteen which was rapidly distilled was often very weak, but this deficiency in strength was removed by the addition of methylated spirits. A small quantity of sherry and colouring matter camouflaged, to a certain extent, the nauseous taste of this vile compound.

Very many ingenious dodges were practised by the enterprising poteen-makers in forwarding supplies to their customers. For quite a long time the spirit was conveyed in petrol-cans without arousing the suspicions of the authorities in the slightest. I believe this dodge was first discovered when the police raided a Belfast garage, and seized a large quantity of poteen in petrol-tins. Moreover, quart bottles were sent by parcels post on countless occasions. The poteen-makers created considerable amusement by their audacity in using His Majesty's mails for the conveyance of duty-free alcohol. Gallon jars in wicker baskets were sent by rail, and boxes of butter and bacon also concealed supplies of poteen.

A good story is told of a notorious poteen trafficker, who neatly outwitted an Excise officer who had received information that he was bringing to the local market-town a load of peat or turf in which a cask of poteen was secreted. The smuggler, hearing in good time that the gauger was on his trail, promptly changed the cask to a friendly neighbour's cart. This cart was allowed to pass unchallenged by the gauger. The suspected cart was, however, seized and taken to the police-station, where the turf was unloaded. To the gauger's chagrin, there was no trace of illicit spirit. The owner promptly created a scene. He said that owing to the gauger's most unjust suspicions he would not have time to find customers for his turf before nightfall. In order to placate him, the unfortunate officer had to purchase the load at twice its market value.

Excise officers have had very many unpleasant duties to perform in the past in connection with the suppression of illicit distillation. They have had to spend arduous days and nights tramping over hills and bogs accompanied by the Royal Irish Constabulary, searching for

still and poteen-makers. Needless to remark, the gauger who was a successful sleuth was none too popular in his district. It often happened that over-zealous Excise officers were kidnapped shortly before the trial of illicit distillation cases in which they were important witnesses. Indeed, in some cases officials were threatened with terrible penalties if they persisted in interfering with the poteen distillers.

So great has the poteen evil become during recent years that not long ago a meeting of wholesale wine merchants called the attention of the Revenue authorities to the practice of illicit distillation now being carried on with impunity in Ireland, to the obvious detriment of the revenue and of traders who desire to carry on a legitimate trade. The loss to the revenue must amount to a considerable sum, now that the duty on spirits is £3, 12s. 6d. per proof gallon. The authorities are alive to the physical, moral, and national dangers consequent on the widespread traffic in poteen. Energetic measures are being taken to suppress it in those parts of the country in which it is being manufactured and distributed. The Ulster Constabulary have made many raids in the mountainous districts of County Tyrone, and not long ago they made a big capture, when they seized and destroyed £500 worth of illicit spirits. Moreover, three Tyrone men were recently fined £100 each for having 30 gallons of wash on their premises. In this case the penalties were later reduced to £10 each. The newly-constituted Civic Guard has already a respectable number of seized stills to its credit. However, it will take a considerable number of years before the poteen-making instincts of the people are completely eradicated.

Incidentally, it is worthy of notice that the practice of illicit distillation is now comparatively common in countries which were formerly free from this evil. In 1921, 829 illicit stills were discovered in Belgium. These, however, were the result of the prohibition laws, which prevent alcohol from being consumed in public places. It is estimated that in the United States of America there are now tens of thousands of private stills which are working overtime turning out 'moonshine,' as the illicit spirit is termed. Army tanks are used to crush the seized stills, which are then sold as old metal. Furthermore, recent revenue raids in Glasgow and in the mountains of Ross-shire and Sutherlandshire show that in Scotland the art of illicit distillation is still practised, though not to the same extent as in former years. In 1922 a dozen illicit distilleries were raided by the Glasgow police within the city boundaries. It is only a short time since the Brora Customs and Excise officers captured a complete distilling apparatus on the slopes of Ben Ulvaie. In England, too, a few cases of illicit distillation have been discovered by the Revenue officers.

THE RAIDERS.

A TALE OF THE ESKIMO.

By Captain H. T. MUNN, F.R.G.S., Author of *Spirit Island*.

I.

IT was Ammaroo (the Wolf) who proposed, planned, and successfully led the raid. 'Every tribe has its fever, every mountain its wolf,' says the Russian proverb; Ammaroo was the wolf of the Igluliut mountains.

Tradition—which is Eskimo history—does not say if Ammaroo was given his singularly appropriate name as a child, or if he achieved it later in life; if the former, his parents made a brilliant choice, for he was a wolf of the most savage and damnable breed. His appearance corresponded extraordinarily accurately with the *homo Neanderthalis* of Sollas's *Ancient Hunters*, a prehistoric race once inhabiting Europe. 'Pronouncedly simian features,' 'low-browed,' 'prominent eye ridges,' 'head low set on powerful neck muscles,' 'of immense strength and generally brutal aspect, yet large brained and a skilled worker'—the description tallies exactly. If Neanderthal man had the suspicion of cannibalism to add to his other unpleasant traits, Ammaroo had one known wife murder and infanticide to his discredit, though, no doubt, his unpleasant forerunner could have boasted similar feats. They seem to have been only a generation apart, instead of 25,000 or 50,000 years. So faithfully has history dealt with Ammaroo that to this day a whispered 'Hush! Ammaroo will hear you,' at once quietens a noisy or crying child amongst the Too-noo-ne-miuts.

Ammaroo, Oo-ming, and Kito left the Igluliut tribe to which they belonged in February. Their objective was Eclipse Sound, the country of the Too-noo-ne-miut tribe 400 miles to the northward. Ammaroo, by the bye, if tradition speaks truly, gave his wife a severe beating and left her senseless in the *igloo*—presumably lest she should forget him—before starting out.

Both Oo-ming and Kito were wifeless, an epidemic having taken their mates. Ammaroo had considered for a long time that he could do with a second wife, but found an insurmountable unwillingness to oblige him on the part of any parents he approached, which was quite understandable, he being what he was. His effort to provide for his wishes in the future by adopting an orphan child had also failed—accidentally. The piece of driftwood with which he had hit her for some childish fault had unluckily broken her skull.

There was nothing left, then, but a raid, and by dint of persuading, threatening, and probably sheer will-force, Oo-ming and Kito were

induced to join in one; also, though this is no apology, their need was great, for a wifeless Eskimo is an unhappy and miserable anomaly in the Arctic. Oo-ming and Kito come so little into this story that it is worth recording that their later life is said to have been blameless, and that they treated their victims' children as kindly as their own. This, as has been admitted, is not much of an excuse, but it is recorded for what it is worth.

It must be remembered this story deals with the days of bows and arrows, long before the whalers and the missionaries and other white men brought firearms and 'civilisation' to the inhabitants of the Arctic. Since those halcyon days when game was plentiful and sickness rare, the sturdy, indomitable little Arctic folk have dwindled to a remnant in their once well-peopled lands.

Northward the three raiders travelled some 400 miles from Igluliut, till they espied, and carefully scouted, three *igloos* on the eastern shore of Eclipse Sound. This proved to be the winter quarters of a small party of Too-noo-ne-miut Eskimo. The brief survey indicated that there were only two men in the party. For the crime they were about to commit they could have found no better conditions.

II.

Notara—it is with him our story is concerned—owed his life to that not uncommon disorder of civilisation, a stomach ache. A flat stone was kept in the *o-koosh-ting* (the soap-stone kettle or cooking-pot) as a substitute for the hot-water bag of civilisation; and, to enable Notara to reach it more readily, his mother had given him the woman's usual place—the inside one next the snow wall—opposite the large stone blubber lamp. A few weeks before, Notara's father had died, and he was now—as in fact he had been for some time—the meat-winner for the family. He was seventeen or eighteen years old, and a youth of great determination and courage—as the sequel will prove. The other inmates of the *igloo* were a baby, child of Notara's mother's old age, and Kudloo, with whom on this eventful night the baby was sleeping.

Kudloo, about fifteen years old, was the adopted child of Notara's parents, and his playmate, companion, and partner from his childhood. The specific reason of her adoption was as a wife for Notara, adoption for this purpose being a common practice, ethnologists to the contrary. For some time the

two had occupied their appointed places in the *igloo*, and it was her little fingers which had, perhaps rather clumsily, sewn the boots and clothes he wore. 'Common fame never lies,' and tradition has a good deal to say about Kudloo, her good looks and merry smile, her gentleness with children and consideration for the old. 'As Kudloo once said' is the commencement of many an Eskimo woman's tale. Tradition also tells—and this is very unusual, for infidelities are lightly regarded by the Eskimo—of the faithfulness to each other of Notara and Kudloo through a long life. When a young couple are demonstratively affectionate to each other, the older women smile and say, 'Notara and Kudloo have come back.'

III.

A keen wind, the thermometer (had there been one) certainly far below zero, and drifting snow aided the raiders in their work—also the fact that the dogs had all been well fed that night and were in consequence sleeping soundly in the snow porch into which the *igloo* opens; wakeful dogs are what the raider, man or bear, dreads the most.

Approaching noiselessly in the small hours of the morning, the raiders each selected an *igloo*, and on a sign given by Ammaroo, each swiftly cut a circular hole in the *igloo*, or removed the transparent seal-gut serving for a window, and sped an arrow into the body of the sleeper lying farthest from the wall—that is, towards the centre of the semicircular sleeping quarters, invariably the man's place.

Two facts are important to note. Firstly, if you are murdering an innocent man with whom under other circumstances you would be on friendly terms, you should, if possible, kill him before he can see you, as then his spirit will not know whom to haunt; this made Ammaroo shoot quickly and then retire out of sight. Secondly, as Ammaroo happened, quite by chance, to make the hole in the *igloo* immediately over the place where Kudloo was sleeping, the curve of the snow wall sheltered her, and Ammaroo failed to see her; this omission was his undoing later on.

It is easy to picture the uproar which ensued—the shrieks of the women and children, the clamouring of the dogs shut in the porch to protect them from prowling wolves, the groans of the victims. The murderers hastily withdrew to a strategic position to enable them to shoot down any overlooked or slightly wounded male who might attempt a sortie; indiscriminate shooting into the *igloo* would defeat their purpose; a woman with an arrow in her back or stomach was obviously useless to them. In a short time, first from one, then from the other *igloos*, arose the wail of the women calling on the departed spirits of their

mates to return, and the raiders knew they could go and claim their bloodstained prizes in safety.

IV.

Notara and Kudloo had sprung up, to see his mother twitching in death with the shaft of an arrow protruding outside the deerskin blanket; and Notara instantly realised what had happened and why he had escaped. Glancing at the hole in the *igloo* over Kudloo's head, he saw a slender chance of life lay in her not having been seen. It was a 'wife raid' the wailing from the other *igloos* told him, and the women, or the younger ones at least, would be safe. But he also knew his life was not worth a second's purchase; the raiders would eliminate as far as possible any question of personal revenge by husband, son, or brother.

Snatching up his clothes, he whispered to Kudloo to follow him and replace the snow door of the meat-store, a small place opening off the inside of the porch, into which he would crawl. She must then go back to the *igloo*, replace the snow door, and sit beside the dead woman in the place where he had been sleeping. 'They will not harm you,' he assured her, 'and surely will I come and fetch you back soon—yes, if I have to kill the whole tribe who have stolen you. Tell them,' he added, 'your father has just died, and there are only you three in the *igloo*.' This bald statement may make Notara's actions during the raid appear unheroic and pusillanimous, but I think he took the only possible course open to him then; dead he was no good, alive and his day might come.

Now Kudloo knew her party would have been reconnoitred before the attack, and she and the dead woman have been seen outside during the day. Notara's life hung on the question whether he had been outside the *igloo* when the raiders were scouting; and as for thirty hours he had not been out, there was a chance. Terrified and trembling with fear and cold, she sat on Notara's sleeping-place beside the dead woman, and raised the wailing cry for her spirit to return.

V.

A block of snow fell inside the *igloo*, and the hole framed Ammaroo's repulsive face. 'Who is here?' he demanded roughly, his bow bent to shoot if any resistance was offered. 'It is I, Ammaroo the strong, who ask,' he added boastfully. Kudloo held up the crying baby to him. 'Only we,' she wept. 'See what you have done'—and she pulled the blanket off the dead woman's body.

Ammaroo sprang into the *igloo*. 'Get your clothes on,' he ordered roughly, and, snatching the baby from her arms, looked at Kudloo's

youthful figure and demanded in surprise, 'Is this yours?' Speechless with horror, Kudloo pointed to the dead woman, and Ammaroo promptly knocked the unhappy baby's brains out against the stone lamp.

Now, Kudloo was evidently no ordinary Eskimo girl. Even in these desperate moments she realised that Notara's life hung in the balance, and she turned fiercely on Ammaroo. 'To-day,' she panted, 'before sundown, a big party of my people will be here, and they will kill you as you have killed those. Ah! why did I tell you?' And she flung herself weeping on the deerskins, though not before she received a blow on the mouth from the brute's heavy hand. But the resourceful lie effected its purpose. Ammaroo sprang outside the *igloo* and ran over to his two companions with the news. Speed was their only hope; if a large party caught them red-handed they would be surrounded and shot down as mercifully as they themselves had murdered.

In an incredibly short time the dogs were harnessed to two of the sleds, and captors and captured—two women, Kudloo, and three children—were speeding over the ice of Eclipse Sound, the dogs urged by voice and whip to their utmost efforts. Kudloo had been able to whisper to the other women what she had said, and also that Notara was alive, and they aided by assuring the men it was true a number of their tribe were expected. Kudloo was told that Ammaroo wanted to kill the three small children, but his companions refused, and even dared to threaten the formidable ruffian if he attempted it.

Kito and Oo-ming now disappear from the story, save for one brief episode, pregnant, however, with results.

VI.

Notara crept from his hiding-place as the gray dawn began to break. He had overheard what Kudloo had said, and divined the reason; his heart seemed almost to burst when he heard Ammaroo strike her brutally for her reply. That day he buried under stones the bodies of his murdered people. Then he built another *igloo* and waited. If Kudloo could untie some of his dogs at night he felt sure they would return to him. It is said he was that rather unusual thing for a native, a dog-lover, and that all dogs would work for him and liked him. Afterwards he found this was exactly what Kudloo did do, getting a severe beating for it from Ammaroo when he suspected her.

A few days later Notara harnessed seven of his dogs to the remaining sled and went north-west to find his people and tell the tale. Ever ringing in his ears was the boastful cry—his only clue to the identity of the raiders—'*It is I, Ammaroo the strong.*'

VII.

Old Issi-gaito shook his head. 'I know of Ammaroo,' he said. 'The Igluliuts are afraid of him, but he is a leader amongst them. If he tells them to fight for him, they will. Also,' he added practically, 'we have enough women; if we raid the Igluliut people and kill some who have had nothing to do with this they will come and fight us. To keep on killing is no good to either of us.'

This timid advice did not suit Notara, who tried in vain to interest some relatives of the murdered men. They admitted frankly they were afraid of Ammaroo, whose reputation was widespread. So the summer and the following winter found Notara still brooding over his revenge, but apparently helpless.

The following spring he seems to have made up his mind, for he travelled far from party to party till he found one going south to hunt deer towards the neutral ground between the northern tribe and the Igluliuts; with these he joined himself. August arrived, and it was announced that the party had reached their southernmost camp; they did not want to interfere with the Igluliut hunting-grounds. To their surprise Notara said he was going on. He asked them to leave a cache of deer meat at the camp, and informed them he was going to find Ammaroo and kill him. His dogs were summering with Issi-gaito, though usually a deer hunter on the land in summer takes a few dogs to pack meat and skins for him. The natives seem to have considered it was none of their business, and regarded Notara as a mad-man. At all events they left him the cache he asked for, which was very useful later.

Notara was a lad of rare courage, but his quest must have looked pretty hopeless. Eskimo history does not deal with such academic details as plans of campaign, but to me there is something fine and heroic in this youngster just setting out with a fixed, healthy determination to find his enemy, and wherever he found him to kill him as best he might. If tradition has nothing to say as to his plans, it recounts, however, pretty fully his actions and the final settlement.

For five or six days Notara travelled south, living on what he could kill from day to day, occasionally a deer, more often a hare, ptarmigan, or even lemming; then came signs he was near the hunting-grounds of another party, for he stalked and killed a deer with an arrow sticking in its hind-quarter. Next day he saw a native skinning a newly-killed deer.

VIII.

It would be easy to waste ink on the extraordinary coincidence which follows, to comment on its improbability in that vast and uninhabited upland, or even, were I acquainted with

psychic lore, to find something occult in it. I will content myself with the historical story almost as I received it in the picturesque and well-told details from which it is reconstructed.

Exchanging greetings with the hunter, Notara announced he was of the Too-noo-ne-ruch-uit tribe (one far to the west of his own). 'My name is Kito,' announced the hunter; 'I and my brother Oo-ming are with Ammaroo. Perhaps you have heard of him from the Too-noo-ne-miuts,' he added hesitatingly, for the two tribes mentioned were more or less related.

'No,' lied Notara steadily. 'I have seen none of the Too-noo-ne-miuts for two years. I have never heard of Ammaroo.'

Kito looked relieved. 'He is a great hunter,' he said thoughtfully, 'but some, many even of my people, do not like him. I do not like him much myself,' he added naively.

'Why do you hunt with him, then?' asked the other indifferently.

Kito shifted his foot uneasily, and his gaze wandered across the sunlit plain. 'He is a great hunter and very strong. He told—he asked me to come,' he replied lamely.

'It is I, Ammaroo the strong,' surged through Notara's brain, and he stooped over the carcass at his feet, ostensibly to cut a piece of meat, in reality to hide the flush which came over his face as Kito spoke.

Notara rose up. 'I must go back,' he said evenly. 'My companions are far away, perhaps two or three sleeps. May I take some meat with me—I am hungry?'

Kito urged him hospitably to help himself, and as he did so Notara asked casually where Kito's companions were camped.

'I and my brother are over there,' was the reply, indicating a low hill a few miles away; 'but Ammaroo went yesterday one sleep to a lake to the eastward there'—indicating the direction. 'If he finds plenty of deer he is to send his young wife back to us, and we will join him.'

'His young wife!' Notara suddenly choked, and then vigorously spat out the piece of meat he was chewing. The coughing fit over, he was able to turn laughingly to Kito and remark, 'I swallowed too fast;' nor did that simple and unsuspicious murderer see anything unusual in his face.

Bidding farewell, and with a substantial piece of meat slung on his back, Notara returned steadily northward, nor did he look back till he was sure the rising-ground had hidden him from sight. 'His young wife!' Had Notara needed a spur to urge him on, Kito had unwittingly supplied it.

IX.

It was late the second day when, after infinite caution lest he be seen, Notara spied Ammaroo's camp beside a long, narrow lake, and hid him-

self amongst the rocks on the high ground on the opposite side to watch. Soon after sunrise he saw a man leave the camp, and after studying the wind, walk eastward along the lake shore. Notara, from his watching-place, could see deer feeding beyond the long lake, and as soon as the other had left the lake shore and topped the rising ground he too saw them, and Notara watched him sink quietly down and commence his stalk. Exactly what he would do was obvious to the other, himself a skilful deer hunter, and as soon as the ground hid him, Notara descended to the lake and walked leisurely along its sandy shore. He did not even look at the camp across the shining water; the time had not come for that yet. Turning the end of the lake, and taking a long drink before leaving it, Notara came to Ammaroo's track, and crawling to some admirable cover amongst a mass of rocks, waited patiently.

'His young wife!' Notara frowned and muttered to himself, gazing hungrily over the peaceful landscape where the stalker was approaching the unconscious deer.

After some hours' waiting there was a sudden commotion amongst a band of deer leisurely feeding down the wind, and doubtless Notara paid a hunter's tribute to the skill which caused five to run off a short distance and then lie down, obviously badly wounded. The successful bow-and-arrow deer hunter was a highly-skilled workman.

X.

The sun was far to the north-west on its summer-time (and therefore visible) journey when Ammaroo had finished and skinned his deer, made a huge load of meat up into one pack in a deerskin, placed his deadly bow and arrows in the pack, rolled the other four skins into a second pack, and commenced his journey to the camp. A tump-line was across his broad, ape-like forehead, and across his shoulders and chest the other line divided the weight between his back and his massive neck. He plodded steadily on to the rising-ground at the lake foot, laboriously climbed it, passed within twenty-five yards of Notara, lying hidden behind the friendly rocks, and proceeded carefully down the steeper descent to the lake.

Forgive a digression. During the war an elderly sergeant-instructor described to me, when on a railway journey, his special work as bayonet instructor to recruits. The stroke he favoured the most he called the 'kidney punch,' and he prodded me with a stubby forefinger—hurting me considerably—to show me the exact place, above the hip line and slightly to the rear. 'Jes' so far,' he said, indicating about two inches on his finger; 'it comes hout easy as easy, but the 'Un is down and hout.'

Notara sprang to his feet, ran noiselessly towards his unsuspecting enemy, and, when five

yards from him, planted an arrow drawn to its head in the bow exactly in the spot indicated by my military acquaintance. It was the deadly 'kidney punch.'

Ammaroo gasped and pitched forward, his pack flinging over his head and rolling to the bottom of the slope. He tried vainly to rise, and suddenly Notara stood before him, bow in hand. Ammaroo gazed at him with bloodshot eyes.

'I am Notara,' said he slowly, 'the son of the woman you killed last year. That arrow in your vitals is for her. What says Ammaroo the strong now?' Ammaroo made a desperate effort to rise, but the blood gushed from his mouth and he fell back, the sweat pouring from his forehead. 'That,' said Notara, 'is for my mother whom you killed, and for the baby, my brother, whose brains you beat out in my *igloo*.' He carefully fitted another arrow in his bow and drew it at his enemy's heart. 'This,' he said slowly, 'is for Kudloo, and for any hurt or harm or pain you may have given her.' The bow twanged sharply, and the writhing figure at Notara's feet lay still.

Notara took up the heavy load of meat, leaving the body where it lay with the arrows still in it, and walked up the sandy lake shore to the camp.

XI.

Inside the small deerskin tent two women sat dully waiting the hunter's return. Both bore marks of ill-usage, the elder one a black eye, the younger a livid bruise on her cheek. Kudloo was taller and thinner than when she had left Eclipse Sound, nearly two years ago, and a pathetic droop to her mouth effaced the merry smile of a year before.

A step sounded outside, the thud of a load thrown down, and a voice called gently, 'Kudloo, Kudloo.' She started to tremble violently, and her eyes filled with tears. The other woman looked up, startled by the strange voice. 'He is dead,' whispered Kudloo. 'It is Notara's voice, and his spirit is calling me.' She lifted her head with a gallant gesture and smiled through her tears. 'Soon now I shall die,' she said confidently, 'and I shall be with his spirit, as my dreams have said;' and she arose and stepped outside the tent and into Notara's outstretched arms.

It was a rather breathless explanation, for Kudloo, having realised that Ammaroo was dead and Notara was no spirit, but a very real man, could not keep her arms from round his neck, pressing her little nose against his and crying and laughing at the same time. . . . It was Kudloo, his Kudloo; taller, thinner, bruised and tired-looking, but his same playmate and companion still, clear-eyed and courageous as of old.

For a time Notara hardly noticed the other

woman, a shrinking, fear-wrought thing, constantly reiterating the question, 'But are you sure he is dead?' as if Ammaroo were an immortal.

'Come,' said Notara presently. 'Pack the dogs with all the meat they can carry. It is many days' walk to our country, and by-and-by Kito will come after us, and I suppose I shall have to kill him too.'

Kudloo negatived this vehemently. 'Kito hates Ammaroo,' she said confidently, 'but he is afraid of him, and so is Oo-ming. They will be glad he is dead. She is glad too,' Kudloo continued, pointing to the other woman. 'She will come with us. I shall find her a husband amongst my people who will never beat her, and she is the best worker with a needle of all the Igluliuts. Ah!' she said, smiling at her friend, 'she has always been good to me when . . . but I have forgotten those bad days already;' and Notara saw the old smile he knew so well return once more.

'Yes,' continued Kudloo demurely, though with a twinkle in her eyes, 'I too am old enough to be married now, and I want a husband very much'—Notara, dull fellow, started as if he were stung—'I can sew and dress skins and make a *toupik* very well indeed now.' She looked at Notara, then suddenly flung her arms shamelessly round his neck and nestled closely up to him. 'My man, my man,' she crooned softly, pressing her tear-stained face to his, 'forgive my foolish talk—I was only teasing you. Many times I have thought I would kill myself, but always you came to me in my dreams and said you were coming for me, soon coming for me to take me to your *igloo* amongst our people. . . . So I waited. She knows how I have waited, for I have told her often. Come, *ooman* [husband], come; we will start on our journey there now.'

WHEN MAY'S AT THE MORN.

GOLD o' the whin on the hill-sides a-gleamin',
Flute o' the blackbird on blossomin' thorn,
Sunbeams a-dancin' where shadows lie dreamin',
God! but it's bonnie when May's at the morn.

Lilt o' the laverock when dewdraps are pearlin'
Ilk blade o' grass, whether fresh or fit-worn,
Scent o' the wallflower and sang o' the merlin,
Lift, oh my soul, wi' the May at the morn.

Call o' the cuckoo and cry o' the flower,
Daisy eyes lift to the day newly born,
Life's thrill and wonder, a lass and her lover,
Oh for glad youth and the May at the morn!

Stir o' the heart in the peace o' the mornin',
Joy o' forgettin' life's falseness and scorn,
Watchin' the Mighty Creator adornin'
This, His earth kingdom, when May's at the morn.

Chambers's Journal

SEVENTH SERIES

THE SCOTTISH ESTATE DUTY OFFICE.

By ARTHUR ISLES.

IN this office seventy men are stationed by the Revenue to take a portion of dead men's estates. They follow the undertaker, and their view is, on the whole, melancholy.

Every letter written in the office is headed ———, *Deceased*. The examiners are confronted daily with fortunes left by others to others, and sigh with *Iolanthe's* Lord Chancellor, 'But never, ah never, a one for me!' Across dull official folios may flit a young lady of attractive name with a thousand a year, succeeding to another thousand on her marriage. Can the impressionable young examiner rush round to her address with his offer? He knows that she abhors him. But for him, and his death duties, her thousand might have been twelve hundred or more.

Gems of humour are very scarce, though the oppressed official makes the most of what there are. One shines in the will which began—'My nephew James to get nothing and not to be allowed to enter my house.' That raised a smile, but the sequel created a roar. The angry testator had forgotten to dispose of the house in his will, and inevitably and legally it fell to James as heir-at-law.

Wills and inventories are open to the public for inspection in the offices where they are recorded, but the lists of debts are confidential, and sad reading. Doctors' and nursing-home fees, often running into hundreds of pounds, witness months of pain. In a minister's estate the list of accounts due to tradesmen too frequently reflects his meagre stipend, and where the list is small the struggle has often been harder. A rich minister has been known—a well-to-do one is seldom met with; no class has more need of its Widows' Funds.

It is not easy from an inspection of inventories to generalise as to the most profitable trade or profession at present followed. During the war many farmers increased their net capital tenfold, but, when a note of their profits since 1920 is requested, the plain and indisputable reply usually given is, 'None!'

Since the Insurance Act of 1911 doctors have become richer. Two thousand pounds may be demanded for a good collection of panel patients, whose fees furnish a fixed income not entirely dependent on skill or attention. Yet

no one wishes that a young doctor should hang out a red lamp to attract patients, and, after waiting idle years for them, wait years more for payment of their accounts.

Many millionaires have been born in Scotland, but few die there. Certain families, such as the Coats, have provided large returns, and Lord Strathcona's estate bore death duties under thirty different heads; but it was disappointing that Andrew Carnegie left so little estate in Scotland to tax at the top rate of forty per cent.

The well-marked example of the self-made man in a lower rank of life is the Irishman who keeps a public-house and leaves large bequests to the Church. The funeral expenses of such Irishmen have sometimes been unusual. In one case these included six dozen packets of Woodbines and three dozen of whisky, but neither item was accepted by the office as necessarily incurred. The publican's rival in the white shop, the Italian, is reputed to be working a gold mine, but takes care not to leave his savings in any form liable to death duties. Where the estate has by mistake been disclosed to the authorities it has been found considerable.

Foreigners are often caught in our British net. There are many French shareholders in the Tharsis Company, which is registered in Scotland, making the shares liable to our duty. A practical *entente cordiale* has bound the British Government to disclose these shareholders to the French Revenue, who reciprocate by giving particulars of Englishmen under their notice.

The German before the war was usually a pork butcher or interested in the Aberdeen fish trade. It is tempting to speculate whether he was a spy.

Chinese, Indian, and Malay servants cause trouble by unpronounceable names. Fortunately for the office, an agent must write the name in an account in some form of English before the question of assessment can be considered. Such servants have been bequeathed annuities, but the difficulty of *naming* them in the will must sometimes have been insuperable.

Wills are more frequently drawn up by lawyers than by testators. The phrases employed are beyond the layman, and repetitions and extensions

suggest that the reason is 'so much a page.' Five words or over count as a page, and to the scoffer it appears that the solicitor has always the last page in mind, and is by all devices straining to be sure of the five words. To draft, devise, and engross four words for no fee is unthinkable, and it is believed that no page of less than five words has ever entered the Register House.

Lawyers are a stock subject for jest, but the real opinion of them is shown by the volume of business left in their hands. We have in Scotland no Public Trustee, no professional executors, and no official Receiver of Executry Estates, though these abound in other countries. Knaves there are, some in jail, others not yet, but the proportion is not excessive, and small agents are commonly in charge of estates far larger than their own. At the head of the profession are many gentlemen whose income from the law, though large, is not equal to the income from their inherited fortunes. The influence of this body contributes a profound stability to such important and impartial undertakings as banks, docks, and insurance companies.

The examiner in his limited sphere envies them their opportunities, but in the office meets them on level terms. In questions of value and liability to duty such eminent gentlemen are apt to be modest in their estimates, and the examiner has to encourage them to higher figures.

In the modern Star Chamber compulsion is seldom used or required. Prosecutions are almost unknown, but in many cases there

are long epistolary duels between the public and the official. The tax-payer contends for his direct pecuniary interest, but to the official a prolonged discussion is merely additional work not allowed for in his official day, and often made up for by attendance in the office of an evening, a Saturday afternoon, or in some cases the Sabbath. There is no encouragement to the official to exact more duty than is due. He gets no commission, and an overcharge is considered as erroneous and as discreditable as an undercharge. The machinery of the office allows very few mistakes to pass, which is fortunate for the tax-payer, as few of their professional advisers have the time to master thoroughly all the exemptions extracted from dead and gone Chancellors of the Exchequer. A bare acquaintance with the subject involves an understanding of sixteen Acts of Parliament, the first in 1796. To counteract the irregular interpretations which arise from such a limited knowledge the examiner is armed with three hundred separate official instructions and the results of twelve hundred cases decided before the Courts.

Each of these instructions and decisions must be present in the official's mind as he surveys wills and accounts for duty. Seated in an arm-chair, protected from the rain, though not from draughts, with a fine view of Princes Street and two great clocks to tell the hour for lunch and tea, the examiner has yet an exacting course to steer, no tangible prize for success or faithfulness, but penalties for failure, and before him continual reminders of the day when he too will be ———, *Deceased*.

WOLF-CHILDREN AND WEREWOLVES.

By Brigadier-General R. G. BURTON.

I.

I STARTED before daybreak one morning from an Indian cantonment to ride between sixty and seventy miles to my camp, which had been sent on ahead to the jungles where I was going to shoot tigers. It was at the beginning of the hot weather, and already a scorching wind was blowing across the plains, dying away soon after nine o'clock in the morning, by which time the sun was beating down on the earth with that overpowering heat which cannot be imagined, but has to be experienced to be realised. My way lay for some forty miles across open and cultivated plains, until, nearing the distant hills, which were shimmering in the torrid haze, the path entered a deep ravine which was full of bush-jungle. At the entrance to this ravine was a considerable village, composed of mud huts. As I approached the village within about half a mile, I observed

some signs of alarm among a herd of antelope grazing on the edge of the jungle. They were not frightened at me or my horse; they were too far off to take alarm for this reason. But they stood at gaze, as though watching something in the adjacent cover. Suddenly they started off, and were soon going full gallop across the plain, the black bucks, of which there were two or three, bounding high into the air, and one prodding with his horns a doe as though to hurry her on. Presently I saw two wolves come out of the cover, and run for some way after the antelope. I rode towards them, and they stood watching my approach for a time, and then went lobbing away across the open and were soon lost to view.

When I rode into the middle of the village, something which I took to be a dog of large size ran swiftly across the central square, where a great banyan tree, surrounded by a raised platform, formed a sheltered meeting-place for

the village conclave, a rendezvous now deserted in the heat of the noonday sun. So swiftly did the creature run that I did not at first distinguish anything human in its shape. It stopped at a corner, and peered round at me with an unmistakably human face, and then I perceived that it was a human being, apparently deformed and of stunted growth.

At this moment the headman of the village with several of his friends appeared. I dismounted from my horse, which was led away to water at the trough, hollowed out of the trunk of a tree, which lay near the village well, and gradually the villagers assembled as they do when a traveller thus halts in their domain. After some conversation I asked what was the matter with the monster which had attracted my attention, and which still maintained his position at the corner. 'That,' said the headman, 'is our wolf-boy. He lived long with wolves, but has now come to dwell among men.' He called to the creature, which came up on all-fours and squatted at a distance of a few yards. I questioned it, and it uttered a moaning whine, but showed no signs of intelligence, and could not speak.

I asked the headman to tell me its history, and he said that it had been captured in company with wolves the year before, when it had been hurt and was unable to run. It was not known how long it had been with the wolves, but was now thought to be about six years old, and had perhaps been lost during the famine of nearly six seasons past. No child had been missed from the village, but there were many people wandering and perishing in different parts of the country during the time of scarcity. The creature could scarcely move when they found it, but they tended its wounds and were kind to it, and it had taken up its abode with them.

Unfortunately at that time, many years ago, I had not learnt to make a scientific inquiry into such matters. I had to hasten on to my camp, and my route on my return was not through the village in question, which I had no occasion to visit again. So whether the child had really been brought up by wolves, or whether it was merely an idiot abandoned by travellers, it is not possible to determine. But the formation of the limbs showed that it had been accustomed to walk on all-fours, and it could not stand upright.

In view of the predilection of wolves for carrying off children, it is not surprising that stories of wolf-children should have grown up and multiplied; and it is intelligible that where the she-wolf has lost her young she may in rare cases have adopted and suckled the man-child which she had taken away to devour. The wolf has from classical times been the subject of superstition and dread, probably owing to the familiarity which pastoral man acquired with

the habits of the animal. Chaucer says of the statue of Armipotent in the Temple of Mars:

A wolf there lay before him at his feete,
With eyen red, and of a man he eat.

The feast of Lupercal was celebrated in Rome in commemoration of the legend of Romulus and Remus. Shakespeare refers to similar legends in 'A Winter's Tale':

Wolves and bears, they say,
Casting their savageness aside, have done
Like offices of pity—

where Antigonus conjures the spirits to instruct the kites and ravens to nurture the babe. There is a biblical flavour in the story of Semiramis, the founder of the Assyrian Empire of Nineveh, who was said to have been fed by doves; and Firdausi tells of the son of a Persian general exposed on Mount Elburz and brought up by birds of prey; while a Phrygian boy was said to have been nourished by an eagle.

II.

In India these stories are lifted out of the domain of fiction and legend in many cases of wolf-children, some of them apparently well-authenticated. There have been from time to time several of these waifs of the jungle at the Sikandra Orphanage at Agra. It is remarkable that these have always been male children. None of them has ever shown the intelligence of Mowgli of the *Jungle Book*, and none has even possessed the power of speech.

One was captured on the bank of the Gumti River in Oudh by two troopers, who found it in company with two wolf-cubs, with which it ran on all-fours. It had callosities on the knees and elbows, due to this mode of progression. This boy had a dog-like intellect, and was quick at understanding signs. He was said to have been visited not long after his capture by three wolves, which came evidently with hostile intentions, but which, after closely examining him, he not being in the least alarmed, played with him, and some nights afterwards brought five of their relatives.

Another Sikandra wolf-boy, smoked out of a den, was a perfect wild animal. He drank like a dog and preferred raw bones and meat to other food. He would never wear clothes, but tore them up into fine shreds when they were given him. These children of the jungle generally died young, but one was said to have lived to advanced age. In another case a lad of fifteen, who was in the orphanage in 1874, was remarkable for the shortness of the arms, which were under twenty inches long, their growth presumably having been arrested through his going on all-fours. This boy was brought in with the body of a she-wolf and two cubs, in whose company he had been found when they were killed.

The capture of one of these children is described in an article contributed to the *Academy* many years ago by Professor Max Müller, who related the following story: 'A trooper, sent by the Governor of Chandour to demand payment of some revenue, was passing along the bank of the river about noon, when he saw a large female wolf leave her den, followed by three whelps and a little boy. The boy went on all-fours, and when the trooper tried to catch him he ran as fast as the whelps and kept up with the old one. They all entered the den, but were dug out by men with pickaxes, and the boy was secured. He struggled hard to rush into every hole or den they came near. He became alarmed when he saw a grown-up person, but tried to fly at children and bite them. He rejected cooked meat with disgust, but delighted in raw flesh and bones, putting them under his paws like a dog. They tried to make him speak, but could get nothing from him but an angry snarl or growl.' This boy afterwards lived in the care of Captain Nicholetts at Sultanpur, and died three years later, when he was supposed to be about twelve years old.

In another instance a man and his wife went out to cut wheat at Chupra, and, while they were at work, their child, who had a scarred knee, was carried off by a wolf. Six years later the boy was seen with a wolf and three cubs, and was caught after a fierce resistance, and recognised by his scarred knee as the boy who had been carried off. He would eat nothing but raw flesh, and a year later escaped to the jungle.

A more recent case, where a panther was the foster-parent, was reported not long since from the North Cachar Hills. In this instance a panther, whose cubs had just been killed, carried off a baby boy and kept him alive for three years, at the end of which the panther was killed and the child was rescued and recognised by the parents. He was accustomed to run on all-fours, and had callosities on the knees and elbows, but in course of time he resumed the upright position. When caught he bit and fought with every one who came within reach, and he would tear to pieces and devour any fowls he could lay hands on.

The hill people of the Himalayas believe that bears steal and bring up children, but there is no record of such an instance. A few years ago, however, a child was brought into Naini Tal who was said to have been nurtured by a monkey. This was a female about eight years of age. It had vaccination marks, but looked more simian than human, having a thick growth of hair down each side of the face and over the spine. The absence of callosities on the extremities showed that it had always walked upright. It was thought that the child may have

been abandoned during a season of famine, as is frequently the case, and picked up by a monkey. Its further history is unknown.

III.

More sinister are the stories of werewolves or wolf-men, who can be transformed from human form into that of a wild beast. It is a superstition at any rate as old as Homer, while Ovid describes Lycan, changed into a wolf as a punishment for his crimes. The intimacy of wolves with men in many countries accounts for their appearance in so much legendary lore, from the story of Red Riding Hood to their influence on the nomenclature of flowers. The puff-balls or lycopodiums get their scientific name from their resemblance to the dark, circular, cushion-like foot of the wolf; and the upper surface of the foot was seen by botanists of old in the cut leaves of the gipsy-wort or lycopus, meaning 'wolf's foot'; while the gaping mouth of the wolf has its supposed analogue in the bugloss or lycopsis, meaning 'wolf's face.'

Wolves have always been credited with ferocity, and have been the objects of dread, but the captive recently sent to the Zoological Gardens from Eastern Europe need not be feared, for the courage of the animal is supposed to depart with its captivity, as in the story of the old woman, the wolf, and the fox that fell successively into a pitfall, but kept aloof one from the other. It is not the same with all animals. I recollect how in India a dog fell into a dry well, and a panther that was chasing it fell in after it, followed by a policeman who ran out to see what all the noise was about. The panther killed the policeman and ate the dog!

Visitors to the Zoo should bear in mind that, according to an old superstition, they must try to see the wolf before it sets eyes on them; otherwise they will be struck dumb. The keeper may also be recommended to take good care of his charge, or he may find its tail stripped of hair, for there is a love-charm of peculiar virtue resident in one hair of a wolf's tail, which must be plucked from the living animal!

This, however, has nothing to do with werewolves, which are peculiar to Europe, the place of wolves in this respect being taken by other animals in other countries. In India the monster able to take on human form at will, or on the application of a salve or medicine, is a tiger or a panther; in Africa, a hyæna; and in some parts of Europe a bear, which has some very human attributes, and bears much resemblance to a man when its skin has been stripped off, while its hind-foot leaves a man-like track.

It is a question whether the legends with regard to werewolves are not to be ascribed

to the form of insanity called lycanthropy, under the influence of which human beings imagine themselves to be wolves or other bloodthirsty monsters, and act accordingly. Some of the apparently aimless murders of quite recent times, and in fact of all ages, may perhaps be ascribed to obsession by wolfish and bloodthirsty propensities, which would, in the Middle Ages, have led to those suffering from them being classed as werewolves, and perhaps have resulted in course of time in their being invested by tradition with the power of transformation into wild beasts.

A typical instance of this nature is recorded as having occurred in France in 1598, in a wild and unfrequented spot near Candé. Some countrymen one day came upon the mutilated corpse of a boy. On their approach, two wolves which had been devouring the body bounded away into the thicket. The men gave chase and followed upon the bloody tracks, when they suddenly came up with a man crouching among the bushes, half-naked, his teeth chattering with fear, his long hair and beard and hands dyed with blood. The man confessed to having killed and devoured the boy, and declared that he was able to transform himself into a wolf by means of a salve given him by his parents. A very similar story was prevalent among the aboriginal Gonds in a wild district in India where a panther had been killing human beings. The panther was said to be a transformed Gond, who had been changed from human form in the following circumstances. He and his wife were walking along a road when they met a panther. The woman was frightened, but the man said, 'Do not fear; I will transform myself into a panther and drive this beast away.' He accordingly gave the woman a powder, telling her to place it in his mouth when he came back for it, and it would enable him to return to human shape. He then swallowed another powder, and at once assumed the form of a panther and drove away the beast on the road. But when he came up to his wife with open jaws to receive the antidote, she was so terrified that she spilt the powder in the dust. Enraged at being thus condemned to continue his existence in the shape of a wild beast, the monster killed the woman, and thereafter took to preying on humankind.

IV.

Some thirty years ago I disposed of a man-eating panther, to which a legend of a similar nature was attached. The people of the country it infested described it as walking upright and being black and tailless, a devil and not a panther, evidently according to the werewolf superstition. This monster had killed and devoured a child shortly before I

arrived on the scene. There was nothing left to tell of the tragedy but a few ghastly fragments, some blood-stained rags, and two little hands with yellow palms upturned to heaven as though in mute appeal for vengeance. I had my bed placed in the shadow of a hut, and shot the beast at night when it was prowling round in search of further victims. It was a small panther. A similar story was prevalent in the Orel Government in Russia, a year or two later, with regard to an unknown man-eating beast that was attacking people, but was never identified. I was in Moscow at the time, but was unable to visit the place, or might have identified the animal from its tracks. I wrote an account of this beast and its depredations in the *Field* of 9th December 1893.

Somewhat akin to the werewolf superstition is that prevalent in India with regard to the spirits of the victims of man-eaters accompanying them and protecting them from impending dangers. Of this nature is the tale of a hunter who sat in a tree over the victim of a man-eater in order to shoot the monster on its return to resume its feast. When the man-eater approached, the corpse, inspired by the spirit of the slain, raised a hand and pointed to the watcher in the tree, thus warning the tiger of danger. The man descended from his tree as soon as the tiger was out of sight, and pegged the offending hand down to the ground with a bamboo stake. He then took up a position in another tree, but when the man-eater returned the other dead hand was raised in like manner, indicating the fresh position of the hunter. Again the tiger, thus warned, made off, and the man got down and pegged down the other hand, and resumed his vigil. This time when the tiger returned there was nothing to warn him of lurking danger; he approached to resume his feast on the remains of his victim, and was shot dead.

I heard in Russia many stories of werewolves, of which a typical one is that of a nobleman who was out hunting when he was attacked by a wolf, which he drove away after cutting off one of its paws. This he placed in his pocket, and on returning home found that it had turned into a human hand, which he recognised by the rings as that of his wife. He found his wife sitting wounded with one hand severed, and brought her to trial as a werewolf, when she was convicted and executed. There is probably partial truth in this story, for it was no doubt the plot of a villain to make use of the superstition of the age and the country in order to get rid of his wife.

The most terrible record of wolfish propensities is that of the Maréchal de Retz, a distinguished French soldier who was tried and executed in 1440 for the murder of some

two hundred children. These murders were accomplished during eight years after his retirement. He was aided in their commission by several of his servants, and in his confession said that he had acted in imitation of

the Roman Cæsars of whom he had read in the chronicles of Suetonius and Tacitus. In accordance with the excellent laws of the time, he was hanged over a fire lighted beneath the gallows.

THE CAT.

PART II.

V.

THAT evening, after dinner, which I ate alone outside my tent, waited on by Mudge, I sent for O'Meara and for Mahgoul. If they fully understood this to be my show, and that they were there only by my courtesy, I would try to be pleasant. I couldn't decently leave an Englishman a hundred miles from the nearest well, whatever I might think of him. As for Mahgoul, his 'Varsitee' education had left him neither fish, flesh, fowl, nor good red herring. His ways were not my ways. But mine must be his until we came across a village or a caravan. Then good-bye.

They both came—O'Meara sulky, Mahgoul rather cringing and talkative.

'To-morrow,' I said, 'I shall move. The tomb will be closed, and some of the people here seem to think themselves its guards.'

'Oh yes,' Mahgoul agreed, 'it is a shrine. They do trade with pilgrims who come to be faith-healed. It is advertised largely by word of mouth.'

O'Meara, lying back in a deck-chair, watched him, but said nothing.

'Then,' I went on, 'I mean to move south-west and visit Siwa. The Western Desert Administration have a post there. I tell you both now, because Siwa will be a good place for us to part. You may wish to make plans before we get there.'

O'Meara nodded, and laughed rather nastily. 'Thank you! I quite understand!' he said. 'Is there anything more? If not, I've got some writing to do.'

'Nothing more, thank you,' I said, 'though there may be something to talk over before we part.' And he turned, and went.

But Mahgoul, after watching him away, slid nearer. 'That most regrettable event, Doc,' he said, 'of this afternoon——' but I cut him short. I abominate that Americanism, 'Doc,' and anyhow I wasn't going to be spoken to in that way by my gipsy dragoman.

'Who the devil are you speaking to?' I asked, in a sort of sudden childish fury. 'Let me hear that word again from you, and the camel-drivers shall use their whips on you!' And Mahgoul cringed at once.

'Purely honorific title, in my intention,' he explained, 'signifying healing power. But, sir,

I feel you ought to know, though I would not have it publicly known that I have peached, but in the tomb I was trying to defend stolen goods for your Excellency——'

'Oh, get out of it!' I snarled—and he was doing so, when one of the camp-servants came with a message for me, and I had to order Mahgoul to halt and translate.

He listened, and then turned grinning to me. 'The girl sends message,' he explained. 'She wishes to show gratitude for hospitalities, and render *quid pro quo* to Hakim Effendi.'

'She needn't,' I said. 'Ask her who found me in the *wady*. Besides, what can she do?'

'Oh, nothing!' said Mahgoul. 'Nothing of much worth! But the baggage states she can dance, after her fashion. Nothing modern or refined, you understand. Not the fox-trot or the bunny-hug of your London restaurants, but just a little varietee. I think, to pass the time, she offers something of a snake-dance.'

'Absurd! She can't feel fit?' I objected.

But Mahgoul grinned again. 'She is quite fit, and will be very interesting, sir,' he assured me. 'She is a hardy baggage, and these people are, as you know, tough as the antelopes—just desert animals.'

'Oh, as she likes!' I said, curious to see what she could do. 'Tell her that if she wishes to, and feels well enough, I shall be pleased.' So the message was passed on, and presently the show began.

VI.

Imagine, then, a hot night in the desert, with a full moon overhead. Black shadows, black as black velvet; and the sandy cliffs, that rose steeply to the plateau six hundred feet above us, looking snow-covered in the moonlight.

A circle was roughly outlined by half-a-dozen hurricane lamps, low on the sand. From among our camel-drivers two musicians were found, of whom one thumped a monotonous drum, while the other piped on a melancholy flute.

I sat in a deck-chair at the circle edge. Perhaps because I was known to have been in a bad temper, no one kept immediately under my eye. The whole performance might, for anything I could see, be for my sole edification; and, after those years of mess-life and constant company, congenial and otherwise, I liked it to be so.

I was listening absent-mindedly to the far-away, high, whining cry of a jackal, when I found that the circle was occupied. The girl had slipped quickly in, and was bent low before me, with a snake writhing in each hand.

As she backed into the centre of the circle, always facing me, the flute-player started a soft, wailing note, to which the drum added a muffled bass.

I saw that she was bare-legged below the knees except for a silver anklet, and bare-armed to the shoulders save for the thin, silver bangles, which clinked a little when her arms moved. Her draperies showed every sinuous movement; her dark eyes, melancholy and mysterious, stared at me above a dark veil, that always seemed about to fall from the lower part of her face, yet never showed it.

Then, to a long-drawn wail of the flute, turning her attention from me to the snakes, she knelt, and put them on the ground, perhaps eighteen inches from her, and two feet apart.

They both immediately struck at her, apparently together. But she was swifter than they. A mere swaying as she knelt, and the two angry, ugly heads darted and recoiled, one on either side of the slim figure, and again she knelt motionless before them, while a low ah-h-h-h, like an indrawn breath, came from the little crowd behind me.

I should have thought it quick work to avoid one attack at that distance; but to survive two seemed a miracle.

Again this happened, and again, while the flute grew more shrill, and the drum louder. Then, the snakes lying quiet and sullen, the girl rose slowly and began to dance, while those behind me marked time with clapped hands.

Bare-footed, swaying lightly, she moved around the snakes and between them, but always facing me. The heavy, silver ring on her left ankle now and again caught the lamp-light, and the silver bangles on her arms tinkled softly to her movements. Faster and faster the music went, faster and faster she moved. Quicker and quicker the snakes struck, as she swirled between them, always just out of reach. Then they sank sullenly again, as if tired out. The flute and drum grew slower and softer. The dancer moved languidly around and between the defeated vipers, and finally sank on her knees, again facing them just as at first.

Then, seemingly wishing to show her power, she flicked contemptuous fingers over their eyes. Like lightning each struck once more, and this time got home. She rose swiftly, with a snake hanging on each wrist; but she shook them off.

'Ask her if she is safe, or whether she needs any help,' I told Mahgoul.

'It is a put-up job, a fake, I think. But we

shall suck the wounds,' he suggested. 'I will "kiss the place and make it well"!' and, laughing fatuously, he moved forward and bent to suit his action to the word. I knew he had been drinking, and probably that accounts for his public misbehaviour. He clawed at her, grasped empty air, and rolled in the sand, his immaculate tarboosh leaving his shaven head bare, while the dancer stood immovable again, just a few inches beyond him, her eyes watching him with an expression that I could not translate.

He scrambled up, cursing in several tongues; but the dancer was gone, vanished from the circle; and when he staggered towards her tent I ordered him to stop. Whether the look she gave him as she went was one of contempt, or a challenge to follow, I didn't know. But I was in a mood to thwart him, anyway; and when he turned on me I ordered him to his quarters. Then I went to my own, and finding Mudge there, told him to see that the girl was free from any risk of annoyance for the night.

But in spite of my precautions I was to have no peace.

The moon was sinking, and a chill little breeze heralding dawn was creeping over the desert, when a queer, half-choking voice roused me from my camp-bed, and some one muttering, staggering, stumbling, lurched in through my open tent-door.

My electric torch and my revolver lay under my pillow, and in a moment I had them both ready. In the circle of light was Mahgoul, ash-gray, shivering, and clutching at the tent-pole.

'What is it?' I asked. 'Are you ill?'

'Dead!' he muttered. 'Dead! The snake! The cat!' And with that, he gradually slid down and died before me.

VII.

In the desert, death and burial cannot be far apart. We buried Mahgoul some eight hours later, the cause of death being obvious, and certified in a statement signed by myself, O'Meara, and Mudge. In the soft sand, the prints of Mahgoul's bare feet were easily traced from his tent to the girl's, and from that to mine. Just inside the girl's tent lay a half-crushed viper, which his bare foot had trodden on as he entered.

The dancer herself was to all appearance asleep, and needed some shaking before she roused up, merely to insist that she knew nothing and had heard nothing.

So we buried Mahgoul, heaping great stones over him to keep him, if possible, from the jackals and hyenas, which held an eerie concert round the camp that night.

No one seemed greatly to mourn for him. We Englishmen had all seen sudden death many

times during the last few years; and the manner of his going did not encourage regret for it.

But I refused the girl's offer to dance again that next evening, and I cut short the jibes of O'Meara, who seemed indecently jovial and light-hearted.

He insisted that Mahgoul had trespassed without the slightest encouragement; and that probably the vipers had both been used as guards against unwanted visitors. There was an air of coxcombry about him that evening which I could not understand—until, returning from a lonely stroll under the stars, I almost blundered against him, standing with a veiled figure, half-hidden in a little clump of date-palms.

I sheered angrily away, telling myself that I was a meddlesome old fool, and that, obviously, the girl was not worth bothering about, and could take care of herself.

Still, she was little more than a child; she had taken trouble on my account, and I wasn't the less interested in her after having probably saved her life.

Her melancholy, dark eyes haunted me, and her little figure swayed before my eyes when I tried to sleep. I determined, before dropping off, that in the morning she should be questioned, and returned to her friends quickly, wherever they might be. But she saved me the trouble.

VIII.

I cannot have been asleep very long, when I woke again with the shock of absolute horror.

I didn't know what had waked me. I could hear nothing to frighten me. But I shook like a timid child after a nightmare, and sweated where I lay, listening to the faint, far-away call of some night-bird.

In a moment or two I pulled myself together and, getting up, looked out of my tent. For a moment I was startled again as I kicked against Mudge, lying across the entrance; but his aggrieved inquiry as to what I wanted and what was wrong quieted my jumpy nerves.

'I don't know that anything's wrong,' I said. 'Bring your torch, and we'll see.' And I led the way to the girl's tent, close behind my own.

It was empty.

I can't say that I was very much surprised, but I hesitated what to do next. Then, 'Follow me!' I said to Mudge, and crossed the camp to where O'Meara's tent stood, closed, some fifty yards distant. A couple of jackals, prowling about it, slunk away into the shadows as we came. There I halted and listened, hesitating, hearing nothing and feeling a miserable eavesdropper.

Mudge kept a stony silence that somehow

spoke volumes of disapproval, and he made no comment when I said angrily to the stars that I must and would see the thing through.

I called O'Meara twice, softly and then louder, but not a sound came in reply.

'Stand by with the light,' I said. 'I must go in!' And then Mudge broke silence.

'I thought I felt something wet,' he said calmly. 'Mind where you step, sir. Look!' and flashing the light on to the sand just at his bare feet, he showed a suggestive, dark patch, which began somewhere out of sight, and grew a little as we watched. Then I pushed my way in without more hesitation. But I was too late.

O'Meara was lying alone, on his back, dead, in blood-soaked pyjamas, close inside the tent entrance. Just above the left collar-bone a deep wound showed, from which blood had almost ceased to drip. The pyjama jacket lay open, exposing his chest; and on the sand gleamed a couple of buttons, wrenched off with a force that had also torn the buttonholes. I bent nearer, and looked more curiously. On the breast was slashed, with a few cuts, a very crude outline. It roughly resembled the design I had seen, crudely suggesting some animal, when I was giving first-aid to the Bedouin girl.

There were also scratches and abrasions about the throat, as though (merely to give my impression for what it may be worth) something hung round the neck had been torn hastily from it.

IX.

The next morning, as I sat outside my tent making rather a poor pretence at breakfast, Mudge grunted, and drew my attention to the horizon.

A rider and his camel were coming our way; and, ten minutes later, a hawk-nosed, hawk-eyed Bedouin rode swiftly up to my tent door, crying the usual salutation in the voice of a man accustomed to hail wayfarers across wide spaces.

Mudge, after a word or two, acknowledged himself unequal to the grave occasion, and two camel-drivers came to his aid.

This, between them, was what they gave me from the wanderer of the desert, while his camel knelt and grumbled and bubbled beside him. 'At dawn, ten miles east of the well, by the burying-place of the Sheik Ibn Yusuf,' he said, 'I met four men on camels; and with them rode a veiled woman, on a white riding-camel.'

'When they saw me, they stayed. One of them turned aside, and besought me to tarry also. As they were four men, and armed, and their beasts swifter than mine, I tarried. Then they talked together, and to the veiled woman; and at last one of them gave me

this message, and made me swear by my father's tomb to find your caravan and deliver it. And he spake thus:

"Say to the hakim, the Effendi Ingleez, with greetings, lest the innocent suffer, that the daughter of the tribe of the Cat, having done that which she was left to do, follows her own people, with That which she stayed for."

'Tell him,' I said, 'that the girl must be found, and punished.' And at that, the man laughed mockingly, but immediately checked

himself and became grave and dignified again, speaking quietly and shortly.

'He says,' I was told, "'Why labour in vain through endless hot days? Catch the wild ass, or the desert wind, or the grain of sand that the wind blows. By this time the girl is far south with the Senussi. Does the Effendem know the road?'"

No, I did not know the road. I'm not sure that I wanted to.

THE END.

LOCUST FIGHTING IN SOUTH AFRICA.

I.

THE Union of South Africa is now in the throes of a destructive war—a war of insect against man—and at the moment man is being badly beaten. For the last three years locusts have swept over the country, destroying crops and pasture; but never in the memory of the oldest farmers have locusts invaded the country in such countless swarms as has been the case in recent months. As the Government has spent more than £1,000,000 in combating the pest, and has employed hundreds of officials to organise the farmers and conduct the campaign, the country is asking quite seriously whether it might not have been better had Nature been allowed to have her way unchallenged. That there may be sound reasoning behind this view-point will presently appear.

No reader who has not himself witnessed a locust invasion can imagine what the visitation in the central parts of the Union is like. Clouds of flying locusts darken the sky. The *voetgangers* (Dutch for pedestrians; the insects are so called while they are only able to crawl, before they have reached the flying stage) form living carpets many miles in length, and a mile or so in breadth. Acres of maize are flattened as if by heavy steam-rollers. In one district ten thousand thirty-foot saplings were broken and bent to the ground by the weight of a swarm. The larger swarms pass overhead with a roar as of a fleet of motor-cars. And yet, it is only a few years ago that an American scientist who came over to study our methods of locust destruction was proudly informed, when asked for material to enable him to pursue his investigations, that the only locust available was reposing peacefully in a glass case in the Pretoria museum. We had exterminated the locust!

To-day the whole countryside has been mobilised to prevent the disaster that the locust threatens to inflict. Self-interest is stimulating even the most backward farmers to action, for ahead they see famine! The locusts are 'eating every herb of the land and all the fruits

of the trees.' Almost literally is this true. Even the potatoes are being eaten off. This is perhaps the most colossal offensive the locusts have undertaken since the days of Pharaoh. Countless billions have sprung from their base in the desert and have penetrated a thousand miles and more into the fertile lands of man, their eternal enemy.

II.

How does man meet the attack? What of his strategy, and his organisations, and his weapons? The corner-stone of the country's locust policy is that the law requires the destruction by the farmer of all swarms of *voetgangers* that make an appearance on his lands. The eggs which are laid in pipes in the earth are difficult to locate, and the fliers have just that advantage that aeroplanes would have over infantry if they outnumbered the men on the ground by ten million to one. So the *voetganger* is singled out for attack. For this purpose the Government issues poison free of charge, and spray pumps on loan to the farmer. In each district the resident magistrate is *ex officio* chief locust officer, and during the campaign a farmer of standing is appointed to assist him as field-officer. A number of local locust officers are placed under the chief locust officer, and it is their duty to make farm to farm inspections, give demonstrations and advice in the use of poison, see that the swarms are destroyed, and generally supervise the work. All police officers are under instructions to report the occurrence of swarms, and to store and issue poison and pumps. The actual destruction of swarms falls mainly to the lot of the farmer. Last season the locust offensive was so formidable that a chief locust officer or locust dictator, as he has been called, was appointed for the Union. He travels about and tightens up the organisation where it is defective. At headquarters in Pretoria the work is in the hands of the officer in charge of locust administration, who is a sort of quartermaster-general. The organisation impresses one until it is remembered that a million square miles of

country are infested, and that in the districts bordering on the Kalahari desert neighbouring farmers live as far apart from each other as London is from Oxford.

The weapon used against the locusts is poison—arsenic. Other methods of warfare have been employed. The inoculation of locusts with disease has been found to be utterly unreliable, though it is stated that the Germans achieved success in this direction when they occupied South-West Africa. Traps are used with some success. Sides of petrol tins are flattened out. Fifty or more are joined together, and two such lengths are arranged on the ground in front of the moving swarm of locusts to form an angle of about ninety degrees, the sheets being fastened by iron pins hammered into the ground. Driven into the angle, the locusts—*voetgangers*, of course—make for a small opening in the corner of the angle, and crawling through it, drop into a pit. The oldest South African method of killing locusts is to bring a troop of goats, sheep, or cattle to the place where the insects have camped for the night, and to drive the animals back and forth over the locusts until they have been destroyed. *Voetgangers*, moreover, are beaten to death with branches of trees, or flails made of pieces of fencing wire. Sledges made of weighted thorn-bush are dragged over the living carpets. The Basutos encircle the *voetgangers* and destroy them by fire, frequently sacrificing large quantities of fodder to complete the extermination. The locusts are also collected and put into bags, which are dipped into a drum of boiling water. The insects are then spread out, sun-dried, and stored as food, or despatched to the factory where they are converted into poultry meal.

III.

But poison is what the locust-fighters rely on. The use of a poison spray or bait has for over twenty years been recognised in South Africa as the most effective method of destroying locusts. In the last few months quarter of a million gallons of concentrated poison, containing about 300 tons of arsenite of soda, have been issued to farmers by the Government for locust destruction. The present output is at the rate of 8000 gallons a day, which means that if the poison is diluted with water in the proper proportion of fifty to one, 400,000 gallons of mixture are being sprayed over the countryside daily. Still, bitter complaints are voiced from many districts that the destruction of locusts is at a standstill, as poison cannot be obtained in proper quantities. The poison, which is manufactured at Bloemfontein, consists of a mixture of arsenite of soda and molasses from the Natal sugar-fields. It is used either for baiting or spraying. In spraying, the diluted poison solution is sprayed directly on the locusts and on the grass in front of them by means of a pump.

In baiting, the solution is used to moisten green barley, horse dung, and other material, and this bait is then scattered amongst the locusts. The destruction of locusts by dusting them with arsenical powder is also being successfully carried out. But the expense is greater than in spraying, and the powder requires expert handling. It has a very irritating effect on the mucous membranes of the nose and throat, and the operator has to wear a mask to avoid inhaling the fumes.

On the South African railways a special engine has been rigged up with appliances for the destruction of locusts. The spray is projected on to the swarms with compressed air, which carries the solution a considerable distance. In order to keep in touch with stations a portable telephone has been installed on the gas-engine. A large number of swarms have already been destroyed by the crew. The railway management have been driven to action. Serious delay is caused to trains owing to the rails becoming so slippery from crushed locusts that the driving-wheel of the engine fails to grip. This explanation is given of a collision that occurred near Cradock (Cape) owing to the brakes of a goods train failing to act.

The farmers have obtained the most wonderful assistance in their war against the locust by practically every living thing on the face of the earth, down to the humblest form of insect life. As the locusts increase, so do their enemies. Countless numbers of the small locust birds intermingle with the swarms of locusts, and destroy them continuously. Other larger birds, such as the white stork and the blue crane, join in the chase. When one of these battles royal is being waged in the air the onlooker on the ground sees falling all around him a shower of locust legs and wings. Starlings and kestrels, as well as the guinea-fowl, the partridge, the *pauw* and the *korhaan*, and hosts of other species of birds, aid in the work of destruction. Horses and cattle gorge themselves with locusts so indelicately that they have been known to succumb. White ants carry off their eggs. Poultry and pigs regard them as manna from heaven. The brummer fly (*Wolfahrtia brunis palpis*) lays its egg in the neck of the locust, which is killed by the maggot of the fly when it is hatched out. Another small black fly, still unnamed, has destroyed swarms in a different manner. It deposits its eggs in the egg-pockets of locusts immediately the female locust extracts its body from the hole in the ground—that is, before the spume which Nature provides for sealing up the egg-pocket has had time to harden, this fly creeps into the cavity. After satisfying itself that eggs have been deposited by the locust, the fly goes in again backwards, where it remains some time, eventually coming out and flying away. If an egg-pocket visited by one of these flies is immediately dug up, a

few small, elongated, pearl-coloured eggs are found on top of the egg-pocket. These small eggs soon hatch, and become a pale ivory-coloured, broad maggot, which devours the locust eggs. It is estimated that in the Graaff Reinet district of the Cape Province 75 per cent. of the locust eggs have been destroyed by the maggot. The brummer fly is, of course, the more immediate agent of destruction, and many farmers are in ignorance of the activities of the unnamed black fly. In 1902 the brummer fly—no doubt assisted by the black fly, though that was unknown at the time—played havoc with the locusts and practically stamped out the plague, as for many years after there was no sign of locusts of any description. It does not seem to have occurred to the locust dictator that these flies, if propagated and distributed, might be more effective than the poison sprays

IV.

That the army of locust officials and willing burghers urgently needs reinforcement of some sort is obvious. It may be a trifle humiliating for man to look to a fly and a maggot to help him. There is in all of us a hankering after the spectacular rather than the scientific. Just as we prefer to symbolise war by 'a thin red line' rather than a poison-gas cylinder, so we in this locust campaign cry out for aeroplanes and mighty machines that will crush acres of locusts as they sweep along their majestic course. It has been quite seriously suggested that aeroplanes should be used against the locust, and that the Defence Force should be called up to assist in the campaign. The *Johannesburg Star*, after reminding its readers that the United States Army officers were co-operating with the Philippine Bureau of Science in the use of chlorine and other gases, suggested that the Flying Corps might take instant action against swarms; they could locate the 'resting-places of the large swarms, and could possibly put into effect a bombardment of gas shells.' The *Bloemfontein Friend* considers that the

members of the Defence Force might well be employed in a short intensive campaign against locusts, co-operating with the officials at present at work in the field.

The farmers in many areas are thoroughly disheartened. After desperate fights they have often had to yield the battle-ground—green fields and vineyards. The Vryburg Farmers Association passed a resolution towards the end of December affirming that in their opinion the infestation was so great as to render it beyond the powers of man to combat with it. The defeatist spirit has developed alarmingly. Those farmers who have not yet given up hope are assembling in congresses—one was held in Pretoria in January—and taking the Government to task. A new form of strategy is imperatively necessary.

At last investigation is being diverted from the laboratory to the allies that Nature offers us so generously—the locust birds and the brummer and the black fly. Unfortunately thousands of locust birds have perished as the result of eating locusts sprayed with arsenic. By the way, they have not been the only sufferers, for losses of valuable cattle have been reported, the result of using a spray of too great strength. The farmers are learning to exercise care, but Nature's allies continue to be destroyed wholesale. Every variety of bird is being reduced in number. The balance of Nature is being upset. So the cry is being raised, in many different forms, to let Nature take its course.

The native, who hitherto has regarded the locust as a dainty morsel for his table, is beginning to view it with suspicion. The farmer in the backveld, deeply religious, interprets the failure of the campaign as a protest on the part of Providence at interference with Divine workings. Even the Government officials are beginning to look foolish with their constantly reiterated assurances that 'the situation is well in hand.' A new strategy is called for; and it will have a simple conception—preserve the birds, and spread the flies.

A GIPSY OF THE NORTH.

CHAPTER XIV.—TO-MORROW.

WHILST Carwyke crouched in the darkness, tormenting himself with the thought of his inability to protect Norma, the girl herself, white-faced and silent, sat at a table in the living-room of the priest's house, eating little, but watching the men with apprehensive eyes. Mardock, after one or two attempts at conversation with her, had relapsed into silence, and was thoughtfully sipping the vodka which had been produced by their host. The last-mentioned, who was eating at a great rate, was also consuming a liberal quantity of the liquor; but Standifer

used it only sparingly, the while he watched the priest with sardonic eyes. Presently, the Russian, stuffed with roast goose, and flushed with the spirit, pressed the decanter on his abstemious guest.

'You do not drink, no! But the liquor is good. It is of my own distilling, and the rye is grown in a sunny valley, where once perhaps in three summers a crop will ripen. The mission is remote, and the spirit lightens the darkness of the long winter night.'

'You have no colleague, Father Arloff?'

'No!' The priest shook his head. 'Once I had, but he was young, and very earnest—too earnest, and he was drowned carrying the eikons to a dying woman when the ice was rotten. It was a great loss.'

'I think I must apply for the vacant post.'

'You? But you are no priest!'

The fat man drew himself up pompously, and on his blubbery face came a look of superiority that moved his guest to a gust of laughter, which he hurriedly turned into a fit of coughing, after which he offered explanation.

'It was no more than a jest! You say true, I am no priest, but I think I could play the part of shaman.'

Father Arloff shook his head solemnly. 'Even that grows more difficult. There is a young pig here, who has been far to the south, and has returned an unbeliever. He gives me much trouble, and I think that soon he will have to disappear. I cannot have disaffection spread among my herd—you understand?'

His guest understood perfectly well, and said so; and then Father Arloff's glance travelled up the table where Mardock sat drinking, with the girl opposite, mingled disgust and terror in her eyes.

'Your bride is not cheerful, no! Perhaps she is of the serious mind.'

'You have hit the nail on the head, father.'

The priest nodded. 'But to-morrow she will be merry, and the day after she will be singing like a bird. So it is often.'

To-morrow! To the white-faced girl that word was like the knell of doom. Sitting there watching the two men, she had easily gathered the degenerate priest's character from his conversation, and Standifer she knew for a man utterly ruthless. She remembered that Billy was lying back there in the woods, shot by the man who sat at the priest's right hand, and that Roy Carwyke, if he were still alive, was a prisoner, and despair surged within her. She looked wildly at Mardock, as if in appeal for help; but in him apparently the vodka had perfected its work and he was nodding drunkenly. Suddenly she rose to her feet. 'I will never marry you!' she cried distraughtly.

The priest's fat face expressed his amazement at this outburst, whilst Standifer looked at her fixedly. 'Sit down!' he said sharply.

'I will not.'

'You will,' he said, with a hard ring in his voice.

'I won't! I won't!' cried the girl in her frenzy.

Standifer rose slowly from his place, took a single step towards her, on his face a look that brought a sudden chill of fear to Norma's heart. But she still stood, though she shook like a reed in the wind.

'You will do what I tell you,' he said in a

voice which was scarcely lifted above the ordinary, but which was yet full of menace.

'I—I——' began the girl, still trying to resist his will.

'Sit down!' he snapped.

Almost involuntarily the girl obeyed him, burying her face in her hands at the same time, the while great sobs shook her shoulders. Standifer eyed her quietly for a moment, then he said, 'It will pay you to obey me always, and not to attempt any tricks. If you try to run away from here, I will shoot that fool Carwyke like a dog.'

For a brief moment or two the girl's shoulders did not shake. Standifer, though he scarcely realised the fact, had given her information that Roy Carwyke still lived, and might yet be able to help her. But she said nothing, and kept her face buried; and after another brief time, she heard Standifer laugh and return to his place.

'You have a way with you, my friend,' chuckled the priest. 'And it is the right way. If Adam had ruled his woman with a strong hand, the world would have been saved a vatful of trouble; and a man who cannot make woman obey him is no man at all.'

Standifer nodded agreement, and laughed as he looked at the girl whose will he meant to break. Then the priest whispered to him, 'They are stubborn sometimes. If to-morrow she will not stand with you before the eikons——'

'She must be made,' said Standifer grimly, 'even if I carry her into the church.'

Father Arloff nodded. 'You are strong—as I am strong.' Then he whispered again, 'There is a thing I have sometimes used which saves much trouble and many tears.'

'What is that?' asked Standifer quickly.

The priest whispered again for a moment. Standifer listened interestedly, and asked, 'Is it harmless?'

'As milk, my friend. I had it from the old shaman who was here when I came. It is very subtle, and a single dose is sufficient to sap the will for—oh, for long enough!'

Arloff laughed as he made the statement, and a speculative look came on Standifer's face. 'It might save, as you say, a heap of trouble.'

'It would, my son.'

'Then in the morning——'

'In the morning,' chuckled the priest. 'It is not noticeable in coffee.'

Standifer rose and stretched himself. For a moment he looked at Norma, and after that addressed his host. 'You spoke of a room?'

'True. I will call the servant.'

The priest clapped his fat hands twice in a manner that sounded like the double crack of a pistol, and in a couple of seconds an Indian woman hurried into the room. Arloff pointed to Norma and spoke some words in the native

dialect. The woman touched the girl on the shoulder, and as she looked up, made signs that she was to accompany her.

Norma, eager to escape from the presence of the hateful men whispering together, rose quickly and followed the Indian woman to a doorway concealed by a moose-hide curtain. As the native dragged the curtain aside, Standifer called out to her, 'Good-night, Norma.'

She did not even turn to look at him; and as the woman dropped the curtain, the sound of the priest's wheezy laugh reached her ears. She stood looking round. The room into which she had been shown was such as might have been expected in this station, so remote from civilisation and so distant from the sea-board. A rude pallet of split pine, with a couple of rabbit-skin rugs, offered sleeping accommodation; a pair of wolf-skins on the rough floor served for carpet, and a stool was the only other furniture. It was all bare and comfortless enough, but, used as she was to the north, she could have slept in it as well as in a palace, but for the fear in her heart—fear for herself and for Roy Carwyke. She easily divined that in their whispering Standifer and the priestly rascal in the next room had been plotting against herself or Roy, or both of them; and she knew beyond all question that to-morrow an attempt would be made to make her marry Standifer in the church whose triple cross had gleamed rosily in the midnight light, promising a sanctuary that she now found was a mockery. But she would resist! She would die before she would consent to marry Standifer. Whatever he did, no matter what he threatened, she would not become his wife. He——

The priest's laugh reached her through the moose-hide curtain; then she heard Standifer's voice, 'We will go see, then, and tell Carwyke.'

She caught the sound of stools pushed back, the shuffling of the priest's moccasined feet, and heard the crash of the outer door. The thought came to her that now it might be possible to slip out of the house into the woods behind. The peril of such a course she knew. Already, after the wrecking of her kayak, she had experienced the terror which the solitude of the forest can awaken in one accustomed to it; but even that was preferable to the danger which had now become so imminent.

Moving to the curtain, she stood for a moment listening. No sound reached her, and a second later she quietly lifted the curtain. Except for Mardock, the room was empty, and the drunkard, as she conceived him to be, was sprawling on the table with his head on his arms. Lightly she moved from the curtained doorway towards the door across the living-room, which gave egress to the outside. When she reached it she stood for a moment, her heart beating wildly. At that instant the man

at the table lifted his head, and his pale eyes fixed themselves upon the girl, with a light of approval shining in them.

Unconscious that she was being watched, Norma stretched a hand to the wooden latch which held the door. She lifted it noiselessly, and then pulled at the door gently. It yielded creakingly, and for a moment she hesitated. Standifer's voice, grimly merry, came to her from the rear of the house, 'A first-class jail, Father Arloff! Even with an axe a man would have his job cut out to break free.'

She opened the door a little wider. It creaked again as she did so, and as she was on the point of slipping out, a rifle barrel was thrust across the opening, and a second later a pair of dark eyes, set in a copper-coloured face, considered her gravely. A little moan broke from her as she fell back, and the door was closed again from the outside.

The man at the table, who had watched the whole incident in silence, now spoke quietly. 'Standifer is taking no chances, Miss Man-nering.'

Utterly startled, she swung round to find Mardock regarding her with sympathetic eyes. 'Oh!' she whispered, 'I thought that—that you were——'

'Drunk,' he finished for her with a little laugh. 'Standifer thinks so, too, as I meant he should. What did you intend to do if that door had not been guarded?'

'Run away,' she answered frankly, conscious of a new sympathy in his manner.

'Into the woods? That would have been folly. There nothing but a miserable death awaits you.'

'Better that than——'

'Yes. I understand. But there are other ways. Standifer himself is not invulnerable, and things may happen before to-morrow.'

'What things?' asked the girl.

Mardock shrugged his thin shoulders. 'Who can tell? "There's a divinity that shapes our ends," as you may have heard even in that confounded hole at Unapik. I hold a private notion that the saying does not apply in Alaska; but there's no saying. The fat priest, whose guests we are, is rascal enough to merit the wrath of God Himself. Just go back to your room. I will see that nothing happens to you in the night, and I promise you that in any event Standifer shall not marry you to-morrow.'

'But how will you prevent him?'

'I will shoot him at the altar first,' answered the man, with a grim laugh.

'You will shoot your friend?'

There was suspicion in the girl's voice—in her whole demeanour—and he could not help but notice it. 'Just that,' he answered. 'Trust me.'

'But why have you turned against him?' she asked, still suspiciously.

'Oh!' Mardock answered lightly. 'Call it a change of heart.'

'But—but——'

'When I came into this business I didn't understand it fully, and I'm not prepared to follow Standifer to the lengths he is willing to go.'

'But you came with him to Unapik.'

'Yes.' He gave an odd laugh. 'I was going to help him to marry a blubber-eating Eskimo. I hadn't seen you then, and now——' He broke off and laughed constrainedly, whilst his eyes, fixed upon her, shone with a light that brought a swift rush of blood to her pale face. She had seen that light in Carwyke's eyes, and her feminine intuition interpreted it aright. That she understood the man saw, and again his odd laugh sounded as he finished the sentence. 'And now things are as you see.'

'Oh!' whispered the girl, a new fear on her face.

'Don't be afraid of me,' said Mardock quietly. 'I am not trying to oust Standifer for any personal advantage. I am thinking of you only, and how I can serve you. I ought to have done so before; but when Carwyke took a hand I never thought that Standifer would ever get so near to the winning-post, and I was not anxious to be marooned in the wilderness. But now——' He broke off as the sound of voices reached them from outside. 'Quick,' he whispered; 'to your room! They are returning. Trust me!' Once more his odd laugh broke out as he added, 'Particularly as I seem to be the chosen instrument of God.'

Norma, with light feet, fled to her room. Mardock dropped back to his stool and resumed his old attitude of drunken slumber; then the outer door opened, and Standifer and the priest entered.

'A very troublesome pair, I should say,' commented Arloff, as, seating himself at the table, he lifted the decanter.

The man whom he addressed laughed. 'Yes. But they will not work together except to get out of your calaboose, father.'

'Divided forces, heh? That is strength for you. And you propose to leave them with me?'

'For a little while, yes. Their boarding expenses for a week would not exceed a thousand dollars, I imagine.'

'No,' laughed the priest. 'The mission will benefit. And afterwards?'

'Oh!' replied Standifer carelessly. 'Let them go. This is a wild land, and they may wander far.'

'Very far, heh?'

'As you say, very far.'

'Off the map, possibly,' chuckled Father Arloff wheezily. Then he laughed openly.

'By St Peter and St Paul!'

'What is it?' asked Standifer quickly.

'I have an idea. That young unbeliever who has been in the south—he shall go as guide. He shall take a rifle and a little, a very little, ammunition. These two men will fight him for it, and doubtless slay him; and the Church will be rid of the thorn that troubles it. Then the two men will fight together for the rifle, and one of them will be slain; and the other—he will go mad in the great woods, and when winter comes the timber wolves will eat him, and there's an end of all our troubles. Is it not an excellent plan?'

'Excellent!' said Standifer, with a dry laugh.

They fell silent, and after a moment Mardock stirred uneasily, lifted his head, and looked round him with dazed eyes. Lurching to his feet, he staggered drunkenly from the room, shutting the door behind him.

Father Arloff watched him go, a light of amusement in his eyes. 'A man without head for the good vodka,' he commented.

'A fool—whom I must carry with me,' was the answer.

'That is awkward on a bridal tour,' laughed the priest, a crafty look in his eyes.

'Yes,' agreed Standifer, with a swift glance at the other's fat face.

'Could it not be arranged for him to be left behind?' asked the father carelessly.

'How?'

'If he drank the coffee in the morning he would be, oh, so weary!' replied the priest, with a chuckle.

'How much?' asked Standifer, with brutal directness.

Father Arloff's eyes glowed with cupidity. 'Two hundred dollars! That is a small sum to pay to perfect a honeymoon.'

'It is just sufficient. I will pay it.'

The priest laughed pleasantly, and thrust out his fat hand, which Standifer took to set the seal on the compact.

(Continued on page 335.)

THREE IN A GARDEN.

'HERE we go gathering nuts in May,

All in a garden fair!

What do they call you in Nursery Land,

You three little children dear?'

'Our names are a symphony played in tune:
Rosemary, Cecily, Margaret June!'

'Whom will you have for nuts in May,

All in a garden fair?'

'One little child with her pansy eyes,

And one with her sun-kissed hair,

And one with a mouth like the rambler rose
That clambering high at my casement blows.'

'Whom shall we send to fetch you away

Out of your garden fair,

When your games are done and the years are
run?'

'Ah, little we children care!

Dawn the day early, or set the sun late,
Love will be there at the garden gate!'

C. M. STEDMAN.

THE LOCOMOTIVE OF THE FUTURE.

By W. O. HORSNAILL.

I.

ALMOST every one must have noticed how quickly electric railways are extending, and how many lines are being electrified. Some have drawn the natural conclusion from these developments that the steam locomotive will gradually die out, and the electric train become universal. But there are limits to progress in this direction, set by the enormous cost of electrification, upon which reasonable returns can be expected only from dense traffic, such as is carried by short lines between our big cities and their suburbs. It is doubtful whether the trains on our main lines will ever become frequent enough to justify the use of electricity for running them.

Where the electric train scores is in being able to get up speed quickly after stops, and in its power to proceed at full speed up the steepest inclines. Owing to these advantages it can perform a given journey with frequent stops in half the time taken by a steam train; and, assuming the trains to follow each other as closely as safety permits, the electrified line will carry double the number of passengers. But on main lines, with long runs between stops, the advantage of being able to get up speed quickly scarcely counts, while the ability of the electric train to maintain full speed up inclines, although of considerable benefit, is shared with a powerful rival that can handle main line traffic at a much lower cost. This is the Diesel Locomotive.

It will be news to many that nearly 350 big, ocean-going ships are propelled by Diesel engines, while another 150 are on order, and it is surprising that so little has been done towards applying this prime mover to the railway locomotive. The Diesel engine bears a close resemblance to the motors which propel motor-cars on the road. It will, however, run on cheap heavy oil instead of on petrol, and consume far less fuel. Many Diesel engines are even run on oil derived from gas-tar. No sparking-plug or any other ignition device is needed in a Diesel engine. The compression is so high that the air in the cylinder becomes practically red-hot, and ignites the oil when it is injected at the top of the stroke in the form of a fine spray. Engines of this type of 5500 horse-power have been built, and examples of more than double this power are under construction for ocean liners. So far as the power is concerned, therefore, no difficulty can arise in providing Diesel engines for the largest locomotives.

Until comparatively recently, there has been only one way in which a Diesel locomotive

could start a heavy train, that is, by using the engine to generate electricity for working powerful electric motors on the driving axles, the system being similar to that of a petrol-electric bus. Such an outfit, however, for a powerful locomotive would be enormously expensive and heavy, although the amount of fuel consumed would not exceed a small fraction of that burned in a steam locomotive. On a car or a lorry, the motor is started and afterwards clutched into the driving mechanism. This could not be done on a Diesel locomotive, because a clutch which would slip for, say, a minute, while the train was getting up speed, would quickly become red-hot. In a big motor ship the engine is started by compressed air, but the propeller offers no resistance at first, and the engine gets up to working speed before the full power is demanded. The amount of compressed air required to start a train would be so great and the apparatus so bulky as to put this system entirely out of court.

II.

Fortunately, a new type of engine which was invented during the war bids fair to render the Diesel locomotive a practical possibility by overcoming the starting difficulty. Moreover, it is extraordinarily economical. This type is known as the Still engine, having been named after the inventor, Mr W. J. Still. It is an oil engine on one side of the piston and a steam engine on the other. In petrol motors and oil engines all the work is done on the upper side of the piston; in fact, the under side is open to the crank-case. In the Still engine there is a piston rod and crosshead, as in a steam engine, and the lower part of the cylinder is closed in. Steam is admitted to the underside of the piston on the upstroke and forces it up with great power, the action being similar to that in a steam locomotive. In this way the engine is capable of giving its full starting power on steam, and a locomotive fitted with one of these engines would start a heavy train with ease.

What may be called the predominating feature of the Still engine is the method of generating the steam for the under side of the piston. Every one who has handled petrol and oil engines will know that the exhaust pipes become exceedingly hot, and that this heat is blown away into the air and lost. Again, cold water is delivered to the cylinder jackets, and comes away hot to be cooled in the radiator. In the Still engine the cylinder jackets form part of a steam boiler, while in another part the hot exhaust gases give up their heat to the water when passing through a number of tubes. In this way a great part of the heat which

would be lost in the ordinary oil engine is utilised for making steam, and this feature gives the Still engine its marvellous economy. When it is started from cold, as would be the case with a locomotive, steam is raised in its boiler by liquid fuel, the same cheap brand of oil being used as that consumed in the cylinders. Once the full pressure has been raised, the engine can be started, and the oil fuel burner is not wanted again, enough steam being left in the boiler to start the train after each stop.

It should be noted that although the Still locomotive will develop its full power on steam for starting, the under side of the piston only does about 10 per cent. of the work after the train has got up to quite a moderate speed and the oil engine side has taken up its load. Therefore, in climbing inclines, the speed does not depend upon the boiler, as is the case with steam locomotives.

III.

The advantages of the Still locomotives are very marked, the chief items being economy and the ability to go at full speed up the steepest inclines. In considering the saving in fuel, it must be remembered that the steam locomotive is consuming coal all the time, whether it is standing idle or hauling a train. It is true that only a small amount of coal is required to keep the steam up while the engine is standing still, but this is not the end of the story. More than half the locomotives in use are in sidings or engine sheds during each night, which means either that the fires are banked or the steam is allowed to fall, extra coal being required in the one case to maintain the steam pressure, and in the other to get up steam in the morning. The Still engine consumes no oil unless it is actually running. In view of these facts, we shall not be far out in assuming that the Still locomotive would need only one-eighth of the fuel by weight which is required by a steam locomotive of equal power. It is true that the oil for the former costs more than twice as much as coal for the latter. Even so, the economy is very pronounced, and when the Still locomotive is adopted, the railway companies will be able to divide their fuel bills by four.

Startling as is the above-mentioned feature, there are others whereby still further economies are effected. Oil is much more easily handled than coal, and, weight for weight, it takes up considerably less space. If a Still locomotive were 'oiled' as often as a steam engine is coaled, only an eighth of the weight would be wanted, and it would take up less than an eighth of the space on the tender. Again, although some water is required on a Still locomotive to cool the cylinders, the amount is only a fraction of that needed in a steam engine. It is unlikely that the Still locomotive will be 'oiled' so frequently as its steam rival is coaled, longer runs being taken without changing engines; but

even if we allow for this feature, so little fuel and water will be required for what may confidently be called the locomotive of the future, that the elimination of the tender is more than probable. Then a great deal of labour will be saved in the distribution and storage of oil as compared with the handling of coal. Oil will be distributed in pipes, and each locomotive driver will take it in through a hose as he takes in water at present.

The fact that the Still locomotive will be able to go at full speed up the steepest incline is of immense importance. Every railway passenger has noted the labouring of the steam locomotive and the reduced speed when the train is mounting a steep bank. The reason is that the boiler cannot make sufficient steam, although the engine is powerful enough to haul the train up at full speed. Being dependent upon its boiler for only 10 per cent. of its power, the Still locomotive does not suffer from this source of weakness, and will be able to take every incline at full speed. This feature is even more important for goods traffic than for passengers, as the capacity of any line which carries goods is limited by the *average* speed of the trains.

Railway engineers have been investigating the possibilities of the Diesel locomotive since the war, and it will not be long before a beginning is made with an experimental engine. Naturally, such a drastic departure in railway practice will take some time to perfect, but once a reliable locomotive has been developed, its adoption will be rapid.

The most important point of all, however, is that not only can Diesel locomotives haul our main-line trains far more economically than electric motors, but they will cost only a small fraction of the many millions needed to electrify the long-distance system of this country. In fact, if money were scarce, steam locomotives could be superseded by those of the Diesel type gradually, as the former were worn out.

TO MY LADYE FAIRE.

IF I could dip my pen in dew,
The crystal dew, some morn o' May,
A song I might make, worthy you,
Of all fair things, epitome.

In vain I sit me down and try
To weave a web of golden words;
To voice your beauty, it would take
The 'morning stars,' the singing birds.

And so, I fling my pen aside,
My pen that hath no wizard-power;
O would it were a 'magic flute,'
To pipe your praises, hour by hour!

Methinks that to no mortal bard
Were given genius to portray
In language loveliness like yours,
Of all fair things, epitome.

MR IMTHURN'S ASSISTANCE.

By JAN GORDON.

PART I.

MR BUFFERY sipped the cup of coffee which he had just made, and, at the taste, pulled a wry, comical face. 'Pah!' he ejaculated. 'That's about bad enough for him. I doubt if I could make it worse; not, seeing the quality of coffee Mr Imthurn keeps.'

He placed the cup on a tray of delicately worked Eastern silver, and was about to leave the pantry, but paused. A line creased his polished forehead. 'I dunno, tho,' he murmured; 'maybe he wouldn't like me to do it, though he don't like 'im neither. 'Ardly tackful, maybe. I'll go and ask him.'

He put down the tray, left the room, and made a noiseless passage, despite his evident weight, through corridors and halls decorated with trophies of Eastern travel. He pushed aside a rich, silken curtain, and knocked at the door which it covered. With a butler's peculiar deference he opened the door, and came into the presence of his master, Mr John Imthurn. The room which framed the latter was decorated in a Japanese style, a style queer and strange for those days of the Regency. Since Mr Imthurn had stepped in some fifty years before the fashion, every object in the room was of exquisite taste and of considerable value. Mr Imthurn had not wasted his time in Japan purchasing rubbish; to this day the Japanese Government would gladly buy back some of the objects with which he returned from his Eastern tour. To harmonise with his room, the connoisseur was clad in a Japanese robe of embroidered silk which might have come from a design by Haronobu.

Mr Imthurn, collector, exquisite, and poseur, looked up from a manuscript which he had been reading. To most persons his face would have appeared placid and without expression; but Buffery had long known his master. He could see signs of displeasure beneath the smooth exterior, as a sea-captain reads the threat of a typhoon beneath the calm surface of a tropic sea.

'Eh?' queried Mr Imthurn. There was a musical note in his voice, but it was the music of metal, hard for all its silvery tone.

'Mr Jarrock, sir,' said Buffery; 'he would like to speak with you.'

No. 699.—VOL. XIV.

'Ah! the good Jarrock,' said Mr Imthurn negligently, and at once Mr Jarrock seemed to be something very trivial and worthless. 'And what if I do not want to see Mr Jarrock?' went on Buffery's master.

'I thought of that, sir,' said the butler. 'Indeed, I said that you were occupied. But he answered that he could wait. Then he asked me for a cup of coffee, sir. I made 'im a cup, made it as badly as I could, sir; but just before I gave it to 'im, it came to me that perhaps you wouldn't like me to do so, sir; so I came to see you, though I didn't like to disturb you, sir.'

Mr Imthurn smiled with his eyes, not with any other feature. 'On the whole, Buffery, I think your coffee might be considered a breach of hospitality. But since you have interrupted me, and since Mr Jarrock is determined to wait, show him in.'

Mr Jarrock was of an age equal to that of Mr Imthurn, but no contrast could be imagined more violent than that between the two men. Imthurn was short, fattish, fair, and appeared young despite the pose of Oriental and mature impassiveness which he had wrested from the East with its art treasures, a pose which made him seem original, even amongst the poseurs of the London of his day. Jarrock, lean, looked taller than he was: he had high cheek-bones and a prominent nose; lines of dissipation drawn from nose-wing to lip-corner made him appear extremely old, gave him that look of carved immutability which seems to come into the face of the hard liver. Imthurn matched perfectly his interior; Jarrock's well-cut but showy clothes blazoned a Western vulgarity against the careful richness of his background.

'Damme, Imthurn, I'm glad to see you!' exclaimed Jarrock, holding out a hand. Imthurn gave his palm with a slow grace of lazy movement. 'Damme!' went on Jarrock in a harsh voice; 'I thought I'd just come in to see you. Fine room you've got here. What a contrast with the ghastly weather outside. 'Pon my soul, I adore these quaint, ugly things of yours. Queer, but dem' original. There's nothing original about this weather, though. I'm sick of it, rain, rain——'

'I'm glad that you like my—er—ugly things,'

[All Rights Reserved.]

APRIL 19, 1924.

answered Imthurn in his even voice. 'But now that Buffery has left the room, I take it for granted that you did not come here to talk either about the weather or yet about art.'

'Why,' replied Jarrock in a composed stutter, 'why, yes—I just happened to come in, you know—was passing, in fact, so I said, I'll run up and see China Imthurn. Don't mind me calling you that, I hope? Everybody does, you know.'

'So I have heard,' answered Imthurn, and at that moment the nickname seemed very appropriate, for from metal his voice had acquired the chill ring of porcelain—his armour was not as thick as he would have wished it. 'And yet,' he persisted, noting Jarrock's confusion with pleasure, 'you wished to see me so much that you would wait. Come, Jarrock, let us be frank. You did want to see me about something, something definite.'

'Well, confound it all!' replied the other, roughly; 'if you insist on having it as bluntly as this, I am in a devil of a fix for money.' Jarrock was very much annoyed at being brought thus abruptly to the point. He had a preference for delicate borrowing. Under his apparently boisterous, but in reality skilled, conversation he would lead the talk the way it should go; and often, indeed, was able to surprise his listener into a spontaneous offer of aid. A cold statement of fact such as this was horrible to him; it robbed him of his comfortable garment of self-esteem. At that moment, despite his real need of money, he was so exasperated that he did not care whether Imthurn lent the sum or no. Yet, having stated his case, it was but foolishness for him not to urge it further. 'I am in need of quite a small amount,' he said. 'Three or four hundred will see me through; but if I don't get it by five o'clock this evening, there will be hell to pay. If I can get it, Imthurn, old chap, I shall be in a position to squeeze out a lot more. I'm just on the edge of a fortune, in fact, but there's that devilish four hundred short. Let me have it, and I'll pay you back within a week.'

'I feel honoured that you have come to me,' said China Imthurn. 'I was not, indeed, aware that our acquaintance had progressed so far.'

'Oh, I know it's a damned liberty!' exclaimed Jarrock. 'I shouldn't have come to you if it weren't serious. In fact, you can judge by that how serious it is. Since you like frankness, I'll tell you straight that it's prison for me if I don't get the money. Prison for one of those miserable pettifogging tangles that a careless chap lets himself in for. I can square it up till five this evening—then it will be all right. If you will only help me out, Imthurn, I'd be eternally grateful.'

'I never lend money,' said Imthurn. 'A creditor is only a nuisance. No! I won't lend

you the money, but I am prepared to come to your assistance in a certain way.'

Jarrock's eyes narrowed. He had been hoping for this; indeed, his calculations had been based on a well-known whim of Mr Imthurn.

'I am prepared to advance you a certain sum to lose at play. I will pay your losses for, say, three-quarters of an hour up to a limit of seven hundred and fifty pounds.'

'But,' cried Jarrock, delighted within himself, thinking it, however, more politic to protest, 'no, no, this is too much; I only need four hundred at the outside, and you offer seven hundred and fifty. I tell you frankly I don't want so much. I won't take advantage of your generosity.'

'Not at all,' said Imthurn. 'I have made you an offer, which, indeed, I have made before to others, as I dare say you have heard—'

'I?' exclaimed Jarrock, feigning ignorance. 'Why, no; I have not heard a word—'

'Rumour, then, does not run as quickly as is generally supposed,' returned Imthurn. 'But, pray, do not think that I am giving you seven hundred and fifty pounds. I offer to pay your losses for three-quarters of an hour's play up to a limit of that sum. Some of my would-be debtors have come off winners, and it then has cost me nothing; others have lost sums of various amounts. Indeed, I do not remember one who went to the limit.'

'Well, damme, it's uncommonly generous of you,' said Jarrock. 'I don't know how to thank you; though I tell you frankly I'd rather have the four hundred straight. I can't see why you do it in this way.'

'Oh,' returned Imthurn, 'it interests me to see which of his own the devil looks after. And in the end it is cheaper. One moment, though. There are two conditions attached to the offer. First, you take my butler, Buffery, with you to the gaming-house. He will hand you the money, in sums of one hundred pounds, as you lose. If you win, you pay him back the amounts he advances to you.'

'But——' Jarrock would have interrupted.

'Another condition,' went on Imthurn, holding up a plump hand, 'is that from this moment our acquaintanceship stops. In future we meet as strangers.'

There was a moment of silence. 'Good God!' cried Jarrock, jumping to his feet, 'I suppose the whole of this rigmorole has been an attempt to insult me?'

Imthurn allowed a ghost of a smile to pass over his face. 'The offer is quite genuine,' he said. 'The offer and the conditions are the same for everybody. There is no question of insult. You can accept or refuse. If you care to refuse, I shall be glad to allow you to shoot at me any early morning which pleases you. I take my risk when I make my offer.'

Jarrocks remembered one or two mysterious duels in which Imthurn had taken part. He remembered, too, that Imthurn was accounted a very good shot. 'No, damme, Imthurn!' he ejaculated. 'Don't be so hasty. I understand, of course, that no insult is intended. A whim; yes, a whim, eh? But why the butler? Why should I lump that surly fellow along? Give me the money, and I swear on my word of honour that I'll bring back the account all square. Damme, the butler's a disgrace!'

'A man excited by play may forget himself, may lose all count of time,' said Imthurn. 'I should not even dare to put your honour into danger.'

'Butler and all, then,' said Jarrocks, with a harsh laugh. 'Though I warn you, it would be cheaper to give me the four hundred. I play high.'

'I'm not the man to grudge another a last fling,' said Imthurn grimly.

(Continued on page 345.)

KING SALMON AND PRINCE HALIBUT.

By H. GLYNN-WARD.

I.

THERE is a little seaport, 'way up in the North Pacific, on the British Columbian coast, looking out towards the sunset over green islands in a wondrous blue harbour, clinging onto sheer rock with its feet in muskeg, intensely proud of itself for defying Nature, who certainly never intended man to build a town there.

It calls itself Prince Rupert, and it shipped in one year nearly twenty-four and a half million pounds of halibut and over three million two hundred thousand cases of salmon, which is doing more than all the other fishing ports on the Pacific coast.

Prince Rupert is a busy little world, sufficient unto itself. Go down on the water-front, past the Grand Trunk Pacific docks, and no one has time to speak to you, but you hear much wise talk about 'whales' and 'mediums,' 'chickens' and 'sharp rooms'; why the Yakutat Banks should be closed for spawning-grounds; the preponderance of American over Canadian boats in yesterday, to-day, and to-morrow; the need of more, and yet more, freight-cars on the Canadian National Railways, and so on.

Go up into the town and you find gangs of men doggedly blasting and hewing broad roads out of the solid rock, and building still more roads up on fifty-foot piles over utterly impossible country, for such is their proven faith in the harvest of the sea.

There are six different halibut shipping companies in Rupert, each of which will assert that they are doing a bigger business than the rest, and all except one, The Canadian Fish and Cold Storage Company (which is entirely British in ownership and operation), are owned by American interests.

In spite of the fact that halibut, like salmon and herring, is steadily but surely decreasing every year, in 1921 the shipments of halibut through Prince Rupert were greater than the previous year by nearly five and a half million pounds.

This may have been due to the shipping strike on American vessels, which held up the usual shipments from Alaskan ports early in the season. Or possibly the fact that the Canadian National Railways supplied sufficient refrigerator cars had something to do with it. Also a record catch was brought in from the Yakutat Banks during November and December, much of which came to Prince Rupert. A movement is afoot to institute a close-season for these banks during the winter for spawning, but as they are situated in international waters, the agreement must be decided upon by both Americans and Canadians.

Every day a fish-market is held in Rupert. You may come upon it unawares if you wander round back of the water-front and in at an unassuming door to a modest little room, with some men sitting in a row at a desk, another listening seriously at a telephone, and a few more waiting by the wall. Those at the desk and 'phone are all buyers, bidding in a jargon unintelligible to the uninitiated.

The captains of the fish-boats in have written up their 'hailings' on a blackboard listed with catches and date for all to see, and so the auction proceeds, sounding something like this: 'Thelma 96!' 'June 60!' 'Over the fence!' 'Your turn, Fred!' . . . A lull, upon which the man at the 'phone gets impatient: 'Come on! Come on! Get busy!' 'Skookum 86!' 'Gee, Bill, you're on easy street!' 'Thelma 91!' 'Guess I'm satisfied!' 'Everybody satisfied?' And half a million pounds of fish have found a market.

II.

Each refrigerator car holds from 20,000 to 25,000 pounds of fish, all packed in artificial ice, which is colder than real ice. Some of the packing companies frequently handle 250,000 pounds of fish a day of all sorts, herring, black cod, witch, brill, and other flat-fish, besides halibut and salmon; 75 per cent. of this goes direct to Chicago.

There appears to be no time at all to lose when there is a boat in—or a whole queue of

boats, each waiting to discharge its cargo in front of a company's wharf. Men wallowing in fish with poles and peevies and hooks, floundering and slipping about waist-deep in fish, weighing them on gigantic scales, shouting the tally, shovelling ice into boxes, shooting fish into elevators to be carried away for mild-curing, salting, or to be frozen for storage.

Of the glistening monster halibuts that were hurled up with grunts and groans, I picked out one which dwarfed the others, looking like a wet white-feather mattress off a vast double bed. He turned the scale at 313 pounds. His head having been slashed off with one turn of the wrist by the man with the knife, he was dragged off to his coffin, where he was packed in ice with two other giants. They hammered down the lid, scrawled '3 whales' on it, and his day was done.

Back in the body of the building they are just as busy. Where they are mild-curing salmon, you notice a German standing by picking out the best of it for his own particular firm of Jews in Seattle. The pick of the halibut goes the same way.

These big plants are half-a-dozen storeys high of storage rooms, mostly filled with fish waiting for the winter season to be shipped when the market is slack. Anything under twenty below zero is a 'sharp room,' and after the fish have spent a certain time in these, they will keep for months in a less Arctic zone.

Rooms full of herring frozen for bait—in one year the Canadian Fish and Cold Storage Company alone stored three million pounds of herring for bait; rooms full of salmon, packed like sardines yards deep around the walls, red and silver, headless gaping bodies; rooms full of halibut, the big ones propped against the walls, stiff white corpses, some many moons old. A cold and sombre charnel house, with a smell like intensified essence of cod-liver oil, that permeates through your brain long after, when you are a thousand miles inland.

But every one seems quite happy. I came on a man feeding a pet seal, quite a baby, but old enough to know where easy food came from, as it returned to its little enclosure every afternoon after spending the morning out and about in the harbour. It was quite a relief to come on somebody in Prince Rupert with enough spare time to say endearing things to a baby seal.

III.

In the North Pacific are by far the richest halibut grounds in the world, but, unfortunately, they are being fished out. Where one boat fished a few years back, there are now twenty. These days there are no fish to be had in British Columbian waters in any paying quantities between 1st October and 1st January.

Also, the scientists, always a meddlesome lot, know more now than they should concerning

the habits of the halibut—when, where, and why they spawn, what they like best to eat, and so on—with the result that the fishermen are able to make a bee-line for their spawning-grounds at the very time when the poor fish want to be left alone to make good last year's depredations.

All the way from Cape Flattery on the south to Kodiak Island and the Aleutian Islands in the north halibut are found in varying quantities, in any seas from twenty-five to two hundred fathoms deep; but boats dealing with Prince Rupert fish chiefly in the Hecate Straits, off the west coast of the Queen Charlotte Islands, and away south as far as the famous Goose Island grounds, where the best halibut are caught from early May to mid-July.

The old steam-trawlers are a thing of the past, and little gas-boats of from five to one hundred tons are used. They provision for two or three weeks, and mostly sign on the same three or four men as crew throughout the season. A good life and few worries!

The very best of food, and, if the cook be poor, one can always pitch him overboard, the way dead bottles go. If the luck be bad and the fish shy, there is ever the hope of better luck next trip; a cosy cabin when the day's work is done, with the lights lit and strange yarns to spin, and the wash of the waves to lull a man to sleep.

The fishers use cotton lines for halibut, two miles long. The main or 'buoy lines' may go two hundred fathoms down; from these the 'ground line' lies anchored, with the 'gauging lines' at every thirteen feet; and on these last are the hooks.

They reckon from two thousand to four thousand pounds as a very good day's catch, and they pray for 'mediums,' which are halibut weighing between ten and eighty pounds; anything below is a 'chicken,' anything above is a 'whale.'

There are three old Grimsby trawlers fishing out of Rupert, the real thing from the Old Country, and you frequently see them use the English style of trolling for flat-fish. In 1922, however, American vessels brought in to Prince Rupert over sixteen million pounds of fish, Canadian vessels little more than half that.

The Canadian Fish and Cold Storage Company at Prince Rupert, who say they are the largest operating plant of this sort in the world, in 1922 prepared as frozen food four million pounds of halibut, two and a half million pounds of salmon, and six hundred thousand pounds of sable-fish. There are additional plants for dealing with the by-products—fish-meal, oil, and fertiliser.

The Oriental demand for dry salt-herring and salmon is growing stronger year by year, and 'chum' salmon, the poorest of the species, is packed to meet it. Most of the Kamchatka salmon-catch is dry-salted for the Chinese market.

IV.

Talking of salmon, if you happen to be in Prince Rupert, take a trip up to the Nass River or down to the Skeena River, on which latter there are no fewer than fifteen great salmon-canneries, and where people think and talk of nothing else.

On 1st April the canneries start their preparations for the year's rush; in mid-June, as soon as the 'sockeye' run begins, they start canning; by mid-August operations cease, the hurry and bustle of the canneries dies down, the temporary, cosmopolitan population of these, each a small town in itself, drifts away; and by the end of September the river is still and lonely, once more awaiting the great ice-floes and the hush of the long winter.

Most valuable of all the species is the 'sockeye,' clear, pale-blue above and glistening silver beneath, though the colour changes after it has entered the rivers for spawning. At regular periods the sockeye run is heavy; for instance, on the Fraser River, down south, every fourth year (the year following leap year) sees big runs of sockeye.

The Indians catch them chiefly by trolling; no Japs (of which there are far too many in these waters busying themselves at this industry) are issued trolling licenses. Gill-nets are the only nets permitted for sockeye; for other species, purse-seines and drag-seines are used.

After the sockeye comes the 'coho,' green and silver with a few black spots, and last and latest in the season the 'humpback' runs; this is the smallest of the lot, blue and silver, dotted with black spots, named so because the males develop a hump in the fall. No doubt some inquisitive scientist will one day discover the reason for this annual pessimism on the part of the males.

The largest of all, the 'spring,' or, as the Alaskans call it, the 'tyee' salmon, sometimes weighs over one hundred pounds, but this is frequently shipped direct to the fish-markets.

Like the halibut, the salmon-fisheries are being depleted, though the Canadian Government, realising that this is one of their most valuable industries, have instituted numbers of salmon-hatcheries in some of the lakes of the interior, and turn out something like fifty million of salmon-fry in a good year. But the blockading by fishermen a few years back of some of the principal salmon rivers, the all too prevalent use of nets, the presence of the far too successful Japanese fisherman, threaten extermination of the salmon unless the strongest measures are taken by the Powers. It is not too much to say that the institution of a close-season for salmon for four or five years is about the only measure likely to safeguard the situation adequately.

In 1921 the total British Columbian pack was 603,548 cases, the Alaskan pack was 2,604,973

cases—four million short of the record pack in 1918 for Alaska.

The pack of sockeye on the Fraser River system (which includes that of the State of Washington) was in 1921 only 142,593 cases, as compared with 559,702 cases in the previous fourth year (when the big run was on), and 2,385,524 cases in 1913. This proves how completely the big runs of sockeye on the Fraser are being destroyed.

V.

The Tower of Babel lives again in a Skeena River salmon-cannery. The fishermen consist of Japanese, Indians, Norwegians, Swedes, Danes, Scotsmen, a few English, Canadians from all over, and Americans. Inside, the cannery, though managed by white men, is operated largely by Indian women packers and the ubiquitous Chinaman.

The Indians come from far and near to put in their summers at work, and make enough to carry them at leisure through the winters. There are the Hyders, who come in little gas-boats or big canoes all the way from the Queen Charlotte Islands, a mighty tribe in the bygone days, when they were known as the 'Terrors of the Pacific.' There are those from Matlakatla, and the Tsimpsians and the Gitupsans.

They have their own quarters, are entirely and haughtily exclusive, and—the squaws especially—utterly refuse to be photographed for fear of being smitten by the Evil Eye. This is so different from the Indians of the interior, who will beg you to photograph them so that they may have their picture to put over their grave when they die.

For the canneries on the north banks of the river, the amusement of the day is for the whole population to turn out and watch the G.T.P. train from Prince Rupert go by with its freight of fish, rushing eastwards *via* Edmonton and Saskatoon for Winnipeg, where the bulk of the freight will be discharged for Chicago and New York.

Just about one quarter of an hour elapses from the time the salmon are picked up off the float, where a man stands knee-deep in a floor of fish, sorting them out, and sending them up the shoot, to the time they are packed in cans ready for cooking.

By methodical and mechanical procedure they are beheaded and tailed, cleaned, cut up into even pieces by the great 'iron chink,' and sent along by the overhead rails to the tables where the Indian squaws, gloved in rubber, are pressing and packing them into 'talls' and 'flats.'

Nothing but salt is put in the cans; they are thoroughly and scientifically sterilised and cooked for 1 hour and 15 minutes before being finally soldered down and turned out to be lacquered and labelled. All grades of salmon

are packed and cooked in the same way, in 1-lb. 'talls' or 'flats' and $\frac{1}{2}$ -lb. 'flats.'

The Inverness Cannery at the mouth of the Skeena, which is one of the oldest, if one of the smallest, of the canneries, turned out 26,000 cases in 1921, each case containing 96 $\frac{1}{2}$ -lb. or 48 1-lb. tins. The total pack from the Skeena River district for the same year was 234,765 cases.

No fishing is allowed during the close-season between 6 P.M. on Friday and 6 P.M. on Sunday. There is little competition for the keeping of the Sabbath observance law on the Skeena, or anywhere else in the fishing world; as soon as six o'clock has struck, every one is either fishing or getting ready to fish, or mending his nets.

The Inverness Cannery has seventy-six boats fishing for it regularly, each one bringing in an average roughly of fifty salmon a trip, or if it be the year of a big run, double this number.

Out on the wharf I watched, fascinated, a Jap, standing on a sea of blue and silver and green fish on the float, wallowing about among the slippery things, sorting, with lightning speed, sockeye from coho, spring from steel-head.

A twenty-ton gas-boat was drawn up alongside the wharf, throbbing to be off. She was

the *Tillicum* of Seattle, bound for Wrangell in Alaska to buy salmon from the Stikine River, expecting to bring back 'all of 7000 fish.' Her crew were buying bait at the cannery, and were going to ice at Prince Rupert before going north to Ketchikan, where they would provision. Presently they loosed her painter, and, as though glad to be off, like a fresh and frisky horse let out of the stable, she sped away over the waters, a great white bird, on her long journey to the far Northern seas.

In the distance, a mosquito fleet of trolling-boats was being towed out to sea by a fast tow-boat; several little sailing-boats, manned by Indians, were homing on the incoming tide.

As I stood on the banks of the smooth, swift Skeena, green with the waters of melted snows, on that balmy afternoon, I pondered on the awful battle for existence that a myriad million salmon were fighting just below.

Salmon returning after years of sea-life to spawn in the self-same waters that gave them origin, with an infallible instinct for homing, swimming countless miles, leaping almost impossible rapids and falls, fighting desperately all the way against their natural enemies, but chiefly fighting against their threatened extermination by man with his thousand weapons.

THE THORN.

By ALBERT G. MACKINNON, Author of *Hospital Jock*.

I.

'MAN, it beats a'!'

It was Lauchlan MacLauchlan's first exclamation of wonder. His niece's raptures at the sights of Rome had been met with a stolid indifference, or with the contemptuous rejoinder, 'Puir cratur!' Lauchlan had much to learn, and he was almost too old to begin. He had been nourished on a stern orthodoxy which looked askance at the world of art. He looked down from a pinnacle of spiritual pride at great geniuses 'makin' fuils o' themsel's.' He had need of awakening, and it had come.

They were standing in a little room of the Capitol. It had only one piece of statuary in it, but it was 'The Thorn.' It represents a boy plucking a thorn from his foot. Its naturalness, the intensity of the lad, the perfect moulding of the bare limbs rank it as one of the most exquisite bronzes in the city of statuary.

'That is supposed to have been made by a student of Praxiteles,' said Mary MacLauchlan, consulting her guide-book.

'I dinna care wha made it, but he maun hae had a stob in his fit sometime hissel', or else he cudna hae done yon.'

Lauchlan still stood staring at the life-like figure on the pedestal.

'Come on, uncle, or we shall lose them,' said his niece, as she started in pursuit of the tail end of the little group which clustered round the guide.

'Gang on yersel', Mary; I'm no finished yet wi' this laddie.'

Mary looked in surprise. What had come over her uncle? He had grumbled at all their sight-seeing, and had followed at her heels only because he did not want to lose sight of her. She was having the time of her life. The labour of a Highland farm had suddenly given place to the enchantment of foreign scenes. It was a happy day for her when the Institute of Agriculture in Rome had sent to Scotland for an expert on Highland cattle. A proposal had been made for the introduction of such into other countries, and so Lauchlan MacLauchlan had been selected to go and advise this central committee on the subject. What Lauchlan did not know about 'beasts,' every one agreed, was not worth knowing.

He had taken his niece to look after him, and he had found that he had to do most of the looking after. She had started him a fortnight before he was required in Rome, and had taken him round by Milan, Venice, Florence, to his final destination.

'It's an unco long way,' he had remonstrated;

but Mary still led on. When they got to Rome there was no respite. Punctuality is not a virtue of Italy. The committee could not meet for another week. Meanwhile Lauchlan was dragged at the heels of his niece through all the great galleries, straining his eyes in vain to get the sight 'o' a decent coo.' But the old painters did not go in much for animal subjects. Neither Raphael nor Michael Angelo was obliging in that matter; so the Highland farmer grew tired with the ceaseless floor treading. 'I wudna be sae done oot wi' a haill day on the hills as I am wi' thae endless picturs,' he grumbled, while he threatened not to waste another day on them; but Mary still carried on, and her uncle paid the dues with many a useless haggles between himself and the custodians.

Now he had suddenly asserted himself, and this time on the side of art. Tell it not in Gath, but the lunch hour was near, the guide was hungry. He was sure now of his day's pay, so he had skilfully steered the travelling comet past the famous statue with just a few words of explanation. He had not imagined that the one who was always so eager to push on would become entangled with 'The Thorn.'

Sentiment and Lauchlan MacLauchlan seemed poles apart. No one who knew this stern and rather crabbed old bachelor would ever have linked the two together. Yet there he stood, stroking unconsciously his gray, stubbly beard, and staring at the little fellow who for ages had been trying to extract the thorn from his foot.

'Come on, uncle,' again called his niece.

'I canna,' he answered, and there was almost an agony in his voice. He spoke the truth. Sentiment, which he had imprisoned for fifty years, had broken its chains and had taken its master captive, and was having its revenge. 'I aince was a wee herd laddie like yon, bare-fitted, but wi' mair claes, I maun say. Ay, I remember weel the day I got a great spike o' whin richt in that verra same spot under the big tae.'

'Tell me about it afterwards, uncle, but hurry up now. There is the guide explaining something else, and we shall miss it all,' remonstrated the girl impatiently.

'Whist, wumman, an' dinna bother me the noo. Awa' wi' the ithers an' leave me alane. Ye canna understaund, sae I needna tell ye.'

'You will lose us.'

'I hae lost mysel' a'ready,' was the enigmatic response. It was the soul of Lauchlan that spoke. He was going down into a great abyss, the brink of which he had long skirted, and from which for fifty years he had resolutely turned away his eyes, because he instinctively felt that despair lay that way. Now he was falling, and the innocent cause of it all was an artist who had been dead for thousands of years, and whose fault was that he was too true to nature.

'Well, if you are tired, sit down on this seat here for ten minutes, and I will come back for you,' remarked the girl as she turned away and ran after the vanishing group of tourists. She little guessed what 'The Thorn' had done to her uncle—how it had pierced through all his stolid exterior and pricked his heart.

'Tired!' he murmured. 'Ay, I'm tired eneuch o' life, an' wish I were back to that day when I had a whin spike in my fit. I hae tried to forget it, but I canna noo after that,' and his hand moved towards the boy in bronze. 'Weel, I'm an auld fuil, but they say they are the worst. I'll gang oot an' hae a smoke.'

So when Mary returned she did not find her uncle, and 'The Thorn,' that had done the mischief, kept silence as to its share in the tragedy—or comedy.

II.

Lauchlan's smoke led him across the piazza and down the wide flight of steps from the Capitol. After that he lost trace of himself. His feet carried him on through many narrow streets until they stopped mechanically before a sculptor's shop. His mind was too busy with scenes of his boyhood to think of where he was going.

He was a herd again on the Highland hills, and with his dog had just chased some stray sheep back to the fold, when his bare foot struck against a whin and a big thorn stuck in his sole. It was very difficult for him to get at the stob, and he was struggling like the lad in the bronze to extract it, when a young girl about his own age came up the path. She realised his plight in a moment, and kneeling down, she took the wounded foot upon her lap, and with a pin began her first operation. She did her best, though her delicate touch caused a deeper wound than the scratching of her pin. It broke open the walls of that secret chamber which held the wealth of a boy's first love. When the thorn was extracted, she bound the foot up with her own handkerchief so that no dirt might get in, and letting the lad lean on her shoulder, she helped him to limp along to the cottage where he lived. That was the beginning; the end came shortly afterwards, when Jessie MacMillan left the parish—and they had never seen each other again.

That day the parish became empty, the hill-side lost its charm, a cruel thorn entered Lauchlan's heart, which he was never able to extract. It too was beyond his reach, and only the same touch could heal that sore. Bravely he faced life with the thorn in his heart. He assumed an outward austerity to hide the inner softness of which he was ashamed, even to himself. He was afraid to think of the thorn, so he buried it under a diligence in business which brought him success.

He had cheated himself with the thought that the thorn was out until to-day. Now he felt it again with all its old agony. Like the bronze figure he, too, had been trying for ages to extract it, and had failed.

Lauchlan awoke from his reverie, to find himself staring into a window which contained, in marble and bronze, copies of many of the great sculptures in Rome. A little back from the others his eyes rested on one of 'The Thorn.' Entering the shop, he demanded, 'Hoo muckle dae ye want for that yin?'

'If you will speak ze English I you comprehend,' responded the shopman. 'I not know Spanish.'

'Gie me that wee laddie, an' tak' what ye want for it, my man, an' dinna haver Spanish tae me.'

The Italian reverted to a common language, that of the fingers, and indicated that his price was four hundred lire.

For once Lauchlan did not stop to haggle, and the Italian was surprised and almost disappointed to find the money pass so easily into his hand without the keen enjoyment of bargaining.

The shopman tied the figure up in brown paper and handed it over to his customer, who took it under his arm and marched off. A guilty conscience made Lauchlan hesitate as he approached his hotel. What explanation could he give to his niece for his strange purchase? She was inquisitive, and would be satisfied with no surface reason. Besides, he knew she was quick to read hidden thoughts. Then a bright idea suggested itself. Instead of bringing it to his hotel in broad daylight he would take it to the station and leave it in the parcel-office and call for it after dark, when he could smuggle it to his room without being seen. He tied hastily a card with his name on it round the neck of the statue, and so placed it in temporary custody.

'Uncle, we were just sending out search-parties for you,' was the salutation which awaited him on reaching the hotel. 'Where have you had your lunch?'

'Lunch? Why, I fair forgot about it!'

'Then what have you been doing?'

But Lauchlan MacLauchlan did not answer, and the girl's searching gaze was met by a veil of mystery.

That night the farmer slipped out quietly from his hotel, and going to the station claimed his purchase. He pointed it out to the porter who attended, and carried it back to the hotel and up to his room without being seen by his niece.

Then, when he was alone, he took off the brown paper and received the shock of his life. The statue was as he had purchased it, but round the neck was a little card bearing the name, 'Miss Jessie MacMillan.'

III.

We must leave Lauchlan staring with an uneasy wonder at the card he held in his hand, and passing a sleepless night vainly trying to unravel the uncanny puzzle.

'Jessie MacMillan! Weel, it beats a'!' we hear him muttering when the silence of night has hushed all other voices.

There is another person, who, at that very moment, is exclaiming in tones of equal astonishment, 'Lauchlan MacLauchlan!'

This is no other than Jessie MacMillan herself. She is in a sleeper on the night express from Rome to Paris. Being all alone and not able to get to sleep with the racket of the train, she had got up to have a look at her last purchase. She was very different in appearance from the girl of Lauchlan's vision with long black hair streaming down her back. Now that hair was much more scanty and tinged with gray. The face had lost the rounded lines of youth and happy smile. Life had not been such a joyous experience as the young girl once thought. There had been thorns. One she had carried all the long journey in her heart, though she had tried to forget it; but that little statue in the Capitol had suddenly unbared the old wound, and to her agony she found it as deep as ever, unhealed after fifty years.

With deft fingers she tore off the brown paper from the figure. One thing about her the years had not marred, and that was her touch. Her hands had character now. Proficient, skilful, they could have plucked the thorn from Lauchlan's foot with more painless ease than once they had. That had been her first operation. Yet its memory remained when the thousands which had succeeded had been forgotten. Her career as a nurse had been one of distinction, and during the war her skill had saved many a life. And that was all due to the thorn of long ago! For from that day she had vowed that the nursing profession would be hers. Now she was a senior matron, with all the severity that befits that rank and that strikes terror into the young novitiates. How they would have laughed had they dreamed that sentiment still lurked in those six feet of discipline, for Jessie MacMillan was a tall woman, within an inch even of Lauchlan's height, and with a face that equalled his in gravity.

'Lauchlan MacLauchlan!' She put her hand to her heart as she read again the name on the card which had been tied round the neck of 'The Thorn.'

The reader of course guesses now the solution of the mystery. Miss MacMillan unknowingly had followed on the heels of Lauchlan in Rome that day. It is still the most wonderful rendezvous on earth, and the old saying is as true as ever, 'All roads lead to Rome.' Daily the most unexpected meetings take place in its streets.

She too had bought a model of 'The Thorn,' and as she was leaving that night had taken it direct to the station. The porter had placed it beside the one that Lauchlan had left. She was in a hurry later when she came to claim it, and lifted the statuette off the shelf herself, but it was the wrong one.

'Lauchlan is in Italy, and has purchased a copy of "The Thorn."' Her feminine mind quickly read his motives. They were as apparent as if he had proposed to her on the spot.

'So he has loved me all these years,' she murmured. 'What fools we have been!'

She turned the card over, and there on the back was an address. It was a card which Lauchlan had used when in Milan, and had the name of the hotel he had stayed at there.

'Here is a clue to his whereabouts anyhow. He must be going to Milan. The past cannot be undone, but we need not be fools any longer.'

Miss MacMillan was a woman of decision. She took out her time-table and consulted its figures, and then questioned the guard at the first stop.

'I arrive in Genoa at 10 A.M. I shall get out there and proceed direct to Milan. We shall meet, and perhaps I shall be able to extract two thorns this time,' she said to herself, as she prepared for this sudden change in her plans.

Miss MacMillan was on the trail, but was starting at the wrong end. When she reached Milan she found that Lauchlan MacLauchlan had been there about a fortnight before and had proceeded to Venice. He had, fortunately, left the name of the hotel he was going to in that city. Miss MacMillan had been successful in her profession because she had been thorough. She never did things by half. She was on the scent of her old lover now, and nothing would turn her aside. At Venice she discovered that the prey had gone on to Bologna. She was catching up on the pursued, for Lauchlan and his niece had spent some days at Venice, whilst Jessie MacMillan put off no time. From Bologna the trail led to Florence.

'Why, I declare I am coming right back to Rome!' she exclaimed, and it was so: the scent brought her once more to the Imperial City. There she discovered that Lauchlan had left the day after her departure. He had given no address, so he could not be followed farther.

'Maybe he is off after me. In that case he will have gone onto Paris, for that was the only address I left behind. I should have thought of that contingency. I have been too impulsive,' she murmured, as she set herself to unpack her box. 'After all, the old saying is true, "All roads lead to Rome."'

IV.

Lauchlan had more shrewdness than Miss MacMillan gave him credit for. She had read

his intentions aright, but impulsiveness was not his weakness. He had succeeded in life by not doing rash things, by taking nothing for granted.

By the morning after his visit to the Capitol the solution of the mystery had dawned upon him. Jessie MacMillan had been in Rome, and was leaving or had already left the city. When in a difficulty take expert advice, had been Lauchlan's motto. Therefore, instead of going to the station, after breakfast he hastened off to the head of police, and asked for the aid of the cleverest detective.

'I want tae follow up a ledgy that's carryin' around wi' her a model o' "The Thorn." That ought tae be clue enuch for a smart heid.'

An Italian who spoke English was put at his disposal, and then Lauchlan was faced with the problem of tackling his niece.

'Ye're great on guides,' he said to her when he returned to the hotel. 'Ye've been gettin' yin every day an' draggin' me at his heels. Noo it's my turn. I hae got a first-class guide, an' we maun juist be ready tae follow him. He wull show us roond. I dinna ken whaur he wull tak' us—that's his business; but pack yer bag.'

The guide's orders were to start by the night express.

'Where are we going to?' asked the niece.

'Hoo dae I ken? Yae place is the same tae me as anither. But trust oor guide. He wull show us roond. He is the smartest man they could gie me.'

With this Mary MacLauchlan had to be content. She had never seen her uncle in such an unreasonably stubborn mood before. His ferocious look made him positively dangerous, and for once she felt cowed by his overbearing way.

'This is the Paris train,' she said with dismay as she found herself being bundled in. Visions of the drudgery on the farm and of a holiday cut short rose before her. 'Remember, uncle, why you came to Rome. You have not yet met the Agricultural Committee which sent for you. They will maybe refuse to pay your expenses if you go away without seeing them.'

Money had always been a strong argument with Lauchlan, but it failed this time.

'Weel, we'll see aboot that later,' was all he said.

A full-size model of 'The Thorn' was a good clue. One cannot trek the country and hide such a big armful. The guard of the train remembered the lady who had carried it, and who had consulted him in the middle of the night about getting out at Genoa so as to go on to Milan.

'We're gaein' tae Genoa in the first place,' said Lauchlan to his niece, as he locked her into her sleeping compartment, 'sae ye can hae a guid night's rest.'

'I suppose we shall be doing a lot of sight-seeing to-morrow?' was her query.

'Maybe,' came the non-committal answer.

But the sight-seeing at Genoa was confined to the platform and the changing of trains.

'It's a grand station,' said Lauchlan, feeling that he must admire something. At Milan they found themselves back at their old hotel, only to be driven off after a hurried meal to join the Venice train.

Mary began to show signs of rebellion.

'I do not see why we should come here again,' she remonstrated.

'Weel, there's nae harm in seein' a place twice,' responded her uncle.

'Seeing? Why, I have only caught a glimpse of the cathedral through the windows of the taxi.'

'Maybe, but a peep o' it is always somethin'. I admit oor guide is a bit o' a hustler, as the Americans wud say. He's grand for coverin' ground. We've got ower a big slice o' Italy a'ready in quicker time than any ither guide could tak' us. He's what they ca' a lightning conductor.'

'I do not see the sense of this,' said Mary impatiently.

'But I dae, my lassie, an' ye wull see it some day too; an' I'm thinkin' it wull no be verra long.'

From Venice they went to Bologna and then on to Florence.

'I expect he will be taking us back to Rome,'

remarked Mary sarcastically as she boarded the train.

'I wudna wonner. It looks like it,' was all the answer she evoked.

True enough they were in Rome the next day.

'Man, that has been a fine bit o' wark,' said Lauchlan as he got out onto the platform.—

'What a lot ye hae seen, Mary, in a'most nae time. Ye're something mair than a globe-trotter; ye're a globe-galopper.'

'When I got you to come abroad, I never thought that you would take the travelling craze like this. It has simply gone to your head, uncle.'

'Deeper than that, girly; it's gone tae my hairt, an' yon bit o' bronze in the Capitol is the cause o' it a'.'

'The lady you seek is here,' said the detective as he brought them to the Hotel Continental.

She was in the hall when they entered. Instinctively the two lovers recognised each other. Time was laughed out of countenance as they took each other's hands, for true love is ageless.

'Lauchlan, I knew you would come; but you have been long about it,' was all she said.

'I wud hae been langer had it no been for "The Thorn." Ye'll tak' it oot o' my hairt this time, Jessie, wull ye no?'

She smiled, and it was out.

OIL-MAKING IN TUSCANY.

By M. L. HUNT.

I.

AUTUMN is past, December has begun; the gold and crimson of poplar and vine are gone; the whole long plain lies in brown and purple stretches; the hillsides are all gray or chill bare brown, with olives and half-dead grass. As the morning mists roll off, the country appears in one harmony of grayish-brown; only by the edges of the little streams clumps of osiers burn in orange flame. 'Till quite late in the morning the mists fill the great plain; from the sunny hillside one looks down on the rolling masses of white vapour, rolling like the waves of a great mysterious sea to the foot of the hills, and as the sun comes over the shoulder of the quarry-hill flushing the gray and white to subtlest golden pink. Bit by bit the flood of vapour subsides; one by one the cypresses stand out, black spires above the mist, which rolls along the line of the river; the marvellous dome of the cathedral comes next, then one by one the towers of the city, until it all lies visible and pearly along the riverside.

Since very early the grand boom or noisy jangle of the many bells has risen through the

thick gray mist, answered by the curious—almost frivolous—clatter of the thin little bells of St Francis, which tinkle shrilly every half-hour among the groves of cypress and ilex on the hill-top above us. From the winding road below the terrace, at present invisible, rise the cries of men urging their mules up the steep old way, and from the mist-shrouded hill-terraces comes the melancholy song of girls and women gathering olives, wailing, mysterious and nasal, yet alluring, with plaintive twists at the end of each line, and monotonous and peaceful and quite as ancient as the chanting in the churches.

It is a day of mist. The sun will shine, but far away. There will be no long gray shadows, clear-cut on the white road, no great depths of sunlight or marvels of radiant blue sky with golden clouds floating majestically.

All will be delicate mother-of-pearl; the sky will be blue, veiled with white; the yellow-white houses will gleam on the ridges of hill among the ilex and cypress; but it will not be a day of gorgeous, overpowering effect until its close.

For days now, from four or five in the morning, the farm people have been busy beyond

their wont, for there is an immense olive-crop, a promise of splendid oil, and if the fruit cannot be quickly picked up from the ground or gathered from the trees, the coming rains and frosts will spoil the hope of a fair harvest. Every one has been at work. As one looks out in the early morning, on the upper terraces, under the lovely gray trees, one sees faintly in the soft shadows the figures of men and women hard at work, their washed-out and weather-stained garments, all indefinite blues and grays and greens, hardly discernible among the trees or against the gray walls. These people working among the vines and olives delight one constantly with a succession of most delicate and beautiful pictures. At midday the children from school have each their allotted task, so many baskets to fill with fallen olives; for the big boys, and sometimes the girls, is the work of climbing the gnarled, split trees, no very hard matter, and carefully picking the black shining berries, like little black plums, which will be used for the best oil.

II.

They know how to work, these Italians—no loitering, no half-heartedness; all are intent on one point, to make the very best of the good promise given them. The land they work on is a constant witness to their untiring labour. Before an olive can be grown, terraces, five to twelve feet high, must be hewn out on the bare hillside, faced with huge stones, fixed, most generally, without cement; and all the autumn and winter and spring these great stone walls must be watched. A crack neglected means an avalanche, and the loss of many fruit-trees, vines, and olives. And then the uses to which they turn this laborious method! In the close shelter of the walls grow rows and rows of white narcissus, perfuming your way up the narrow green paths, under the meeting boughs. Against the sunny walls are roses, moss-roses, tea-roses, all kinds, some, now in December, ready to burst into flower for the Christmas market. And where the constant labour of man has not covered the stones with roses or fruit-trees, Nature has made a tapestry of ferns and ivy and filled each crevice with toadflax and cyclamen, or red and yellow moss, with a brilliant waving crown above of deep-red pinks and golden hawkweed, and at your feet a carpet of sweetest violets.

Tuscan olives are sometimes a disappointment, especially if you already love the stately old trees round Rome, or the luxuriant olives of the Riviera. The trees in many parts of Tuscany are so severely pruned that often there is left only a narrow crown of thin twigs above the split trunk and twisted boughs. It seems impossible sometimes the tree should ever survive the severity of this cutting of its boughs and the hacking out of rotten wood, and often what

is in reality one big tree looks like two, or three, for the rain-water, collecting in the hollows of the trunk, penetrates the tree, and then, freezing, causes the wood to split from top to bottom. But the exquisite elusive quality of the colour and the shimmer of leaves, gray-green above and white below, are absolutely lovely. On the narrow terraces of this wind-swept hillside a very branching, willowy tree would be in danger of being blown over.

In the flatter, less exposed, parts of the country some kinds of olive are less pruned, and grow like willows. Those round Lucca are tall, slight trees, as graceful as a silver birch. In the spring, under the olives, beans are grown, and left until they begin to flower; then, when their sweet scent hangs heavily on the midday air, the beans give their life for the olives, and are dug into the land, to supply the trees with the nitrogen which the little hairs on the bean-stalks have absorbed, and which the olives need, but cannot assimilate during the winter sleep and time of fruiting. Old and very dirty woollen rags are sometimes used to feed the olives, but now rarely in the north, for the peasants who dug in the rags, and the villagers near whose cottages they were used, sometimes fell victims to diseases brought by the disgusting refuse.

In April and May the gray mass of olive-leaves is broken with brilliant pink patches, the blossom of peach and almond, and the ground is a vivid emerald with young corn, among which shine purple and red anemones, scarlet poppies, and red and yellow tulips. And in autumn the brown and gray trunks are wreathed with yellow vine-leaves, in great festoons from tree to tree, with the purple clusters of grapes.

III.

To watch the crushing of the olives and the whole process of oil-making is one of the greatest pleasures of a winter in Tuscany. It has not the same mysterious charm that invests the making of wine and the whole life of the vine, but it is so primitive, so near to Nature, so full of suggestion, that one finds oneself, all the oil-making time, inventing some reason for visiting the dim arched cellars where the work goes on, standing, silent and enthralled, to note each process of the old machinery, with its intricate delights, of wheels and beams and ropes, oneself a source of never-ending amusement and curiosity to the workers.

The process is really very simple, probably little, if at all, more elaborate than what has been used ever since oil made man of a cheerful countenance; and it is a labour in which old methods still give good results.

When gathered the olives must be slightly dried before they can be used, and for this they are laid on the cellar-floor in trays woven of rush. The cellar is a splendour of light and shade. It runs below the terrace garden of the

old convent, one end cut out of the rocky hill, on whose steep sides the villa and its olive terraces lie and bask. Entering by the big old door, with its cypresses on either side, passing down a slope, ridged for the feet of mules, one comes upon a scene most intensely picturesque. The only daylight in the place faintly glimmers through a small cobwebbed window, high at one end. What other light is needed is supplied by small oil-lamps, flaming wicks in flat iron lamps, which throw an orange glow on the faces of the men, while the rest of the cellar lies in deep black shadow. The lamps carry one back ages, for they are Roman-shaped, just the shape which the long-ago labourers in this old Etruscan stronghold used. The air is thick with steam, and heavy with the curious damp smell of the olives. The steam pours in clouds from the big mill, which is beyond a great white archway in a second cellar, where in a cloud of gray and mauve and blue mist an old man with a fine thin face and an old mule are crushing olives under the great stone wheel, almost invisible in the thick steam.

This mill might be any age. Most of the machinery in use is about three hundred years old. The mill is a large round basin, of stone, shallow, some ten or twelve feet across. In the middle is the wheel, about five feet high and two feet thick. It stands up on end, attached to a great centre pole. Into the basin are thrown the olives. A long pole with ropes and straps is fixed to the centre pole, and to this is harnessed the mule. All day long the mule walks slowly round the basin on the little ridged path strewn with straw. The wheel moves slowly in a very small space close to the centre pole, and the old man, with a long spade, constantly shovels the olives under it.

The poor mule presents a comic appearance, for she is harnessed both by her head and her tail, and as she walks with her side to the stone basin, both ends are so pulled round to the centre that she rather reminds one of a fried whiting. The olives which are being ground have already been through the mill and also pressed; they are now making the second quality oil, which is quite fit to eat, but is generally used for cooking, for frying the favourite pancakes and the various ingredients of a mixed fry added to the daily dish of *pasta*.

In the outer cellar stands the press in which, after being slightly ground, without water, the olives for the finest oil, the *Virgine*, are being pressed. The pulp left by the wheel is placed in very curious flat round baskets of plaited string, made with a hole at each end. These baskets, full of ground olives, are placed one above the other under the press.

IV.

Now comes the work in which once more the whole family can join. There is the farmer,

with his wife, his six children, and a prospective son-in-law. It is the old grandfather, Luigi, who is busy with the mule; and there is Cherubina, the grandmother, with round face, all smiles and wrinkles, and a red and yellow handkerchief on her head, standing by to encourage the children, who all work with a will, especially Egisto, aged four, a great workman already, who trots up to the wood behind his mother to fetch faggots, which he carries on his head down the steep paths.

Cherubina takes the foreign visitors under her special care and, with the lisp of a quite toothless old woman, in curt Tuscan, with no 'c's' and many 'h's,' explains the whole process. Her pity for the visitor who, she declares, can understand no Christian language is profound. It is Cherubina's duty, too, to bring the food up from the cottage when the bells ring for midday—slices of dark bread, toasted, and eaten soaked in oil, and a flask of almost black wine, made on the farm and innocently coloured with berries of 'Love-lies-bleeding.'

When the string baskets, full of olive-pulp, are in the press, kept firm by square thick blocks of wood, the two men place a great beam in the screw of the press. To it is attached a strong rope, the other end of which is fastened to a stout pole, fixed from floor to roof at the opposite corner of the cellar, with a small cross-bar against which the men pull and turn the pole. As the pole turns the rope winds round it, drawing the large beam across, and so screwing the press tightly down on the olives. When the rope is tightly wound it is let go, and the beam flies back to its original place. As the press is screwed down the oil runs in a little channel into a great earthenware vat full of water. This is a long slow process, but it is delightful to watch the whole family working vigorously, the men, with beautiful bare feet, using all their strength, each child doing its utmost. Egisto pushes his father along, his round brown face all smiles. In summer Egisto runs about in one small outer garment, a little faun, brown as the earth, full of gladness.

Passing a tiny niche one day, we saw an old dirty playing-card, a queen of hearts, carefully stuck in the hollow, with a fresh bunch of flowers before it. Egisto had found the card, and could only suppose that a lady in such gay colours must be Madonna, and had placed the picture in as worthy a shrine as he could make.

After this first crushing in the press, the olives will be put back into the mill, with boiling water, and after more grinding will again be pressed for the *Sanzo*.

V.

The olives for the best oil are very slightly pressed, and the oil they yield is skimmed from the water in the vat. It looks like liquid mud, quite thick and brown, but the men declare it

to be *olio finissimo*, and if you have the courage to dip your finger in and taste, you will find it has a delicious pure flavour of nuts. The oil is poured into huge red jars kept in a third and inner cellar, a place of dim shadows and enormous spiders. Here it will stand and deposit its sediment before it is moved into fresh jars and divided, half for the owner, half for the farmer; for this farm is worked on the old system—the master supplies farm implements and seeds, the peasant finds the labour, and at the close of the year the produce is divided, half belonging to the owner, half to the farmer. Of course the system is complicated, and there are drawbacks and possibilities of deception, but on the whole it is good, it is personal; the peasant puts his whole soul into the work, and becomes sincerely attached to the farm and to the owner. The principal difficulty is his hatred of new methods; as his father and grandfather worked, so will he. New and foreign methods he sincerely regards, at present, as inventions of evil spirits and quite unchristian, at least entirely foolish. Fortunately there is one new idea which the peasant is accepting: he is ceasing to kill the birds. He really has discovered that live birds, that eat the grubs, are more useful than dead ones, however well toasted, on long wooden skewers, with bits of oily bread—it takes twenty to make a meal; and he attributes this year's splendid olive crop to the flocks of birds that find a safe refuge in his olives and cypresses.

A fourth quality of oil is extracted with renewed grinding and pressing, called *Inferno*,

for burning in lamps; and after this the remains yield yet another lot, which, mixed with other kinds of oil, is used for cleaning machinery and burning in stable lamps.

After this repeated grinding and crushing the refuse, skins and stones, now a solid block of greasy brown stuff, will be fetched away by the owner of a soap mill on the little stream below us, which runs, in winter a torrent, in summer a mere thread, at the foot of the hill from whose tower-crowned summit Dante is said to have looked his last on Florence.

The mill owner will not actually buy the refuse, but will exchange it for a certain amount of the pure soap, of excellent quality, which he will make from it.

And last of all, from the refuse of the soap, blocks, like peat blocks, are made to burn in the winter fires.

At sunset the women and children leave work and go down to the house close by; the men will work on till late into the night; and all will be busy again by five next morning.

As we leave the dark cellar and walk up the steep old drive to the villa garden, the sun, which has been veiled all day by mist, breaks through before it sinks behind the western hills, and the plain, from brown, turns crimson in the sun-touched mist. The river becomes a series of still pools, lit with red fire. Gradually the crimson deepens, changing into purple, the outlines of the hills harden, their graceful sweep clear against a green-blue sky, and day is gone; the bells of St Francis ring out, and are answered all around.

A GIPSY OF THE NORTH.

CHAPTER XV.—A PRIESTLY RASCAL.

ONCE in the open, Mardock, whilst still wearing an air of tipsiness, did not walk quite so drunkenly as he had done with Standifer's eyes upon him. Very erratically he moved from point to point in the village, inspecting its resources, noting the position of the canoes and the like; then circled round the church to the back of the mission-house and the log hut where the prisoners were confined. In front of the door, on a log, sat an Indian with an old flintlock gun.

Mardock stood before him, swaying and staring at him with the solemnity that characterises a certain stage of drunkenness. The native stared back gravely, without moving, and over his black head Mardock took note of the heavy padlock. Then, quite suddenly, he made a motion as if turning a key, and held out his hand. The Indian's only response was a slight jerk of his head, and a finger pointed towards the house.

Mardock understood the pantomime quite

well. The key was not in the man's possession; if he wanted it he must go and ask Father Arloff for it. He nodded his understanding, and then walked stumblingly round the hut. It was, as he saw, without window, and immensely strong. He could do nothing there. Again he moved to the river bank and considered the canoes. It might be necessary that he should flee with Norma, unaided, and he wanted to be quite sure of his ground. It was possible that the Indians might not interfere; very possible that the corrupt priest, already assured of his plunder, would think that it was no affair of his; but it was well to prepare for eventualities.

After noting everything that could be turned to his service in the event of having to make a quick retreat, he reeled back to the house, and entered the living-room. Noting in a single swift glance that Standifer and the priest were still talking, the latter drunkenly noisy in his speech, Mardock staggered to the stool which he

had previously occupied, and once more leaned his head on his arms.

The priest's English was growing less perfect as the vodka loosened his tongue. Russian words and occasional Indian ones now slipped into his speech, but out of the jumble Mardock was able to gather sufficient to understand that now the conversation had nothing to do with the girl whom he had resolved to deliver from Standifer. Arloff, he gathered, was telling the story of his mission; how his bishop had died, and some one had forgotten this church in the fastnesses; and how, having been thrown on his own resources, he had used his barbaric converts to his own ends, uniting with the gorgeous ceremonies of his church some of those of the Alaskan shamans, and thus obtaining a double hold over the ignorant natives. To him, evidently, the ritual of his faith—and the faith itself—was nothing, and morally he was on a lower plane than the Indians whose ignorance he exploited.

Shamelessly, under Standifer's prompting and that of the devil that dwelt in the vodka, he passed to details of his reprobate life, chuckled over incidents that in civilisation would have sent him to gaol, and with the boastfulness of a man in drink enlarged on his own cleverness in keeping in hand this little clan of Indians and making them toil for his profit.

It was a strange revolting story, and as he listened to it, Mardock once rolled his head slightly, and opened his eyes to look at the gross sinner—this Judas among priests. The man had a leering look on his stout face. There was a gleam of mirth in his heavily-pouched eyes, as if he found humour in his shameful confession, and some of the liquor which he was consuming had failed to find his mouth and had dribbled down his bushy beard. Mardock gave a little shiver as he looked on the leering face and bulky form. He himself had lived wildly, carelessly, indifferent to the ordinary codes, and had slipped into shame from which on the morrow he hoped to redeem himself somewhat, but this one-time priest of Christ had become the chuckling minion of Hell, who deserved to be shot where he sat.

His half-shut eyes turned from Father Arloff to the man who was listening to the jocund confession of shame. Standifer, smoking, was staring at the drunken priest with a half-smile of ironic contempt on his dark face. That he was genuinely interested in this stripping of a vile soul for his amusement was clear; and now and again, as Arloff showed signs of ending, he prompted him with some question which moved the priest to detail some fresh enormity. One question that Standifer asked had a particular interest for the listener at the table.

'And have you never had trouble with the fools?'

'Trouble!' laughed Arloff. 'Oh yes! One

time—twice or more. There was a girl . . . you comprehend? The father would not accept the price, so I took her, and though the girl is now dead and the man is old, he hates me, and would do me an injury if he dared. He is a friend of the young unbeliever of whom I spoke, and I think they conspire against me. But I will deal with the ancient when the young buck goes with your friends—'

'S-s-s-h-h!'

Standifer shot a warning glance in the direction of Mardock, who lay perfectly still, and the priest chuckled softly. 'You could stick a knife in him, my friend—he would not waken. The vodka is very good; and when a man is not accustomed to it—'

He broke off and pointed a fat finger at Mardock, who had every appearance of drunken somnolence, and then, almost at the same moment, he himself began to nod, and nearly rolled off his stool. At that he rose, swayed a little uncertainly, and held out a hand. 'Good-night, friend. So long a conversation is a pleasure, but one must sleep in preparation for the morning's work, you understand.'

He shuffled off, his gross form rolling from side to side. Standifer watched him with undisguised contempt. When the priest had disappeared, he helped himself to a small portion of vodka, drank it at a gulp, and turning his back upon Mardock, stared steadily in the direction of the moose-hide curtain that masked the entrance to the girl's room. The watcher's hand stole to his pistol. If Standifer—

The thought went unfinished, for at that moment the man turned on his heel, and, without so much as a glance at the other, walked to the door and passed out of the house. When the door had closed behind him, Mardock rose quickly, and walked to the doorway of the girl's room, with the pistol in his hand. 'Miss Mannering!' he cried, in an urgent whisper.

There was an almost instant response, and the girl's hand dragged the curtain aside. 'What—'

'Take this,' he said abruptly. 'Use it if anything goes wrong—on Standifer! You understand?'

'Yes,' answered Norma simply, gratitude shining in her eyes.

He went back to the table, and when Standifer returned, was in the position that he had been when the other had gone forth. This time Standifer stood considering him a moment, then laughed lightly, and going to a corner where blankets had been thrown, made himself comfortable for the night. Mardock waited until the other's gentle breathing told him that Standifer slept, whereupon he rose, stretched himself, and tiptoed to the door. Opening it softly, he stared out. As he did so a native, armed with a rifle, rose from a log, and waited to see what he would do. Interested in the man's

actions, he stepped outside and moved towards the river bank. The Indian made no attempt to molest him, but as he moved on, went to the house door and thoughtfully closed it.

That the native was on guard was clear enough, and as he continued on his way to the river, Mardock wondered if he were there to prevent intrusion, or if he were on the watch only to prevent the girl's egress. A second later the point was settled to his satisfaction, for, hearing a slight sound of movement on his right, he looked round and saw another Indian squatting on the ground under a window at the side of the house. A swift mental survey of the interior told him that the window must be that of Miss Mannering's room, and from that fact he drew his own conclusion as to the purpose of the watcher by the door.

When he reached the bank and looked down to the water he made a new discovery. The canoes were no longer there. They had been removed since he had made his tour of the mission. By whose orders?—the priest's or Standifer's? If by the former's command, then there was treachery abroad; if by the latter's, it meant that Standifer was taking no chance of losing Norma at the last moment. He stared at the empty landing-place for some time, then, turning abruptly, went back to the house. As he opened the door a little wind wrenched it from his hand, and the door banged. He latched it, and turned to find Standifer sitting up in his blankets. 'Kit,' he said quickly, 'the canoes are gone!'

'Yes, I know,' replied the other with a slow grin. 'I arranged with Arloff to have them carried into the woods. A sensible precaution, as you will agree. I don't want the girl to break away now.'

Mardock stood for a moment without replying, trying to hide his chagrin, whilst the other watched him closely; then he put his hand to his head. 'That confounded vodka!' he muttered. 'It's made my brain beat like hammers.'

Standifer laughed. 'It's a crude liquor. Better take another nip—hair of the dog, you know—and lie down.'

'I th-think I will,' replied Mardock, with a thickness of speech that he had no need to simulate, for his nerves at the moment were so strained that his customary voice was denied him.

He went to the table and poured a little of the spirit into the tin cup that he had previously used. As he sipped the liquor his brain was busy. Should he throw himself upon Standifer and try to choke the life out of him now, or should he wait and see what chances the next few hours would bring? The other's precautions had already stultified his plan for a hurried flight with the girl; and now he was driven to find a new scheme. If he could kill Standifer— He thought with regret of the pistol which he had given to Norma, and then

remembered the rifles. In the same second of thought he recalled that they had been placed in the corner where Standifer reclined, and so were beyond his reach. To attack the other when he was awake with bare hands would be the merest folly. Standifer was a far more powerful man than himself, and the contest would be so unequal that there could be no hope of success. He must wait until the fellow slept again, and then— He set down the tin cup noisily, and moving to a place where other blankets had been arranged, dropped down, rolled one of the blankets round him, and lay in such a position as would enable him to watch Standifer.

Standifer apparently had no intention of seeking further sleep. With the blankets round the lower half of him, he sat with his back against the house wall, lighting his pipe. Mardock watched him cautiously, his mind busy with the situation, which was sufficiently difficult. Quite suddenly he recalled Arloff's answer to Standifer's question ament trouble arising from the priest's high-handed actions. Would it be possible to exploit that hatred of which Arloff had spoken against both him and Standifer? Scarcely had he asked himself the question when it was dismissed. Such a course would require much time—and time was denied. But what had Arloff meant when he said the young buck should accompany Standifer's friends, and why had Standifer intervened with his warning? Why was he himself to be denied knowledge of the plans which the pair had made? Was he included in their scope? It was more than possible that Standifer, having Norma secure, meant to leave him behind; and there lay a further explanation of the disappearance of the canoes. The more he considered, the more convinced that such was Standifer's intention did he become; and now, determined at all costs to wreck the man's plans and save the girl, he waited until the other should give himself to sleep again.

But that the scoundrel never did. Each time that Mardock opened his eyes it was to see Standifer, back against the wall, smoking thoughtfully, his eyes wide open, staring at the opposite wall. Once sleep overtook Mardock himself, and he emerged from it with the sound of laughter in his ears. He looked quickly at Standifer. The man's dark, lean face was wrinkled with amusement, as if at some thought which had occurred to him. Mardock wondered what that thought was, and once more lay waiting for his opportunity.

From the river came the weird cry of a loon, like the wail of a lost soul, and on the heels of it sounded the honking of geese. Somewhere close at hand a young bird began to cheep, and a robin's voice proclaimed the morning. A little while later he caught the sound of guttural voices outside the door, which presently opened,

admitting the Indian woman who had laid the table on their arrival. He watched her throw kindling chips in the stove, and still watched when she cleared the table and began to set it for the morning meal. Standifer was leaning against the wall, and suddenly the man turned and fixed his dark eyes on Mardock. 'Sleep well?' he asked, a satirical note in his voice.

'Tolerably,' lied the other, sitting up.

'Um! I'd have sworn you didn't,' laughed Standifer, rising to his feet. 'But I have known men sleep with open eyes before.'

There was mockery in his dark eyes as he spoke, and Mardock felt himself flushing as the conviction assailed him that Standifer had himself been on the watch through the night. He made no reply, but waited to see what the other would do. If he moved away from the rifles—

A shuffling step caught his attention, and turning his head, he saw Arloff's heavy figure entering the room. The fat face was flushed, and his eyes had a rather bleary look; otherwise there was no sign of his last night's debauch, and he greeted Standifer like a brother.

'The good day has broken, my friend,' he said with his wheezy laugh.

'Yes,' answered Standifer. 'Better send the woman to call the girl.'

He did not move from the corner, and wondering if the other guessed what was in his mind, Mardock, with the intention of disarming any possible suspicion, rolled out of the blankets and went outside. The Indian with the rifle was still at the door, but did not bar his exit. In the open place in front of the village natives were moving to and fro, building a fire, and others were preparing the flesh of a young moose brought in by hunters. It was easy for him to guess that a feast was in preparation, and that it was to be the wedding feast of Norma Mantering and Standifer. With growing trouble in his heart he moved onto the river. The canoes were still missing from the landing; and as he knelt and soused his face and head in the river he was conscious of despair. If he did not kill Standifer soon there was no hope for the girl, and now he had little hope that the opportunity would be given.

Shaking the water from his hair, he stood for some time in thought, and then returned to the house, to find the others already at the table, with the fragrant aroma of coffee pervading the room. The priest waved him jovially to a seat that was set next to Miss Mantering's, and as he took it he gave her good morning, and saw that whilst her face was very pale, she had a look of composure beyond what might have been expected in the circumstances. The Indian woman set a mug of coffee and a plate of moose meat and bacon before him, and he began to eat, noting as he did so that the girl, whilst she toyed with the food before her, ate little, though she steadily sipped the coffee.

The bacon was rather salty, and as he ate Mardock drank freely of the coffee, and presently his mug was empty. This Father Arloff was prompt to note, and his clapping hands quickly brought the Indian woman with a fresh supply.

'You find the coffee good, my friend?' asked the priest, hospitably anxious.

'Excellent!' answered Mardock, as he took up the mug.

Father Arloff gave one of his wheezy laughs. 'That is all right,' he said in an odd voice. 'We pride ourselves on our roasting.'

Mardock scarcely heard the last words, being concerned with a sudden dizziness that had overtaken him. The room seemed to be going round, and there was a mist before his eyes. He lifted a shaking hand and rubbed his forehead, and for a moment the mist broke, and he had clear sight of Standifer watching him with an enigmatic smile upon his eagle-like face. The mist rolled up again and he felt himself swaying in his seat. Then understanding came to him and he cried out, 'Doped, by—!'

He heard the priest's chuckle, caught the sound of Standifer's laughter, and his reeling brain knew that his conviction was the right one. He staggered to his feet. There was a thing that he could yet do—that he must do before he collapsed. What? . . . With his hand rubbing his temple he remembered, and turned to Norma, who was watching him with a sick look of fear in her eyes. 'The pistol,' he said thickly, thrusting out his hand. 'Give me—'

The girl understood, and promptly producing the hidden pistol thrust it in his shaking hand. But, swift as she was, Standifer was swifter. Resting his hands upon the table, he vaulted right across it, and as he did so his legs swept the reeling Mardock off his feet, whilst the pistol was jerked from the shaking hand. Standifer himself fell to the floor, but the other disregarded the fact, and on hands and knees strove to reach the pistol. The man whom he would have killed gained his feet, looked for a second at the crawling figure, laughed harshly, then stooping swiftly, gripped the other's neck and belt, and flung him against the wall, where he collapsed and lay still.

Norma cried out in fear and half rose from her seat, but sank back again as she felt herself falling. What was the matter with her she did not know, but she felt as she had felt when, no more than a child, she had first ventured on a rolling sea in a kayak. Her head was swimming, there was a dimness before her eyes, a throbbing as of distant drums in her ears, and she felt as if she were sinking to the floor. She gripped the table to save herself from falling, and as she did so, through the drumming in her ears, caught the fat priest's wheezy laugh and the sound of his voice. 'Ha! ha! ha! The coffee is excellent! What did I tell you, my friend Standifer?'

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

BEING deep in southern Tunisia lately, at the oasis of Gabes, beyond which railways went no more, and nothing was left for journeys save slender, sandy desert tracks, I realised that over there, more southwards and towards the east, there were two separate communities of people of Berber strain who had held themselves from civilisation and all its works and wars, and differed in some important ways from all others. They lived widely apart, yet there were touches of their respective evolutions that had something in common; for while the troglodytes of Matmata were lodged deep down in holes in the earth, the people of Medenine and Metameur abode in what might be considered as earthen tubes stacked above the ground. That was their effect, and it appears that in essence the idea of these overground tubes is the underground cave brought up to the surface, retaining in another form the measure of protection against raiders and beasts, and also against climatic excesses, that was one of the reasons why in a distant age the men and women of Matmata went down below, and why, looking over their country, I knew that I beheld a town, as it might be called, of five thousand inhabitants or thereabouts, and yet saw no living person and no house of any kind, but only a few holes, and then some palm-trees scattered at wide intervals. The persons of Berber strain who dwelt thus, it appeared, had either never heard of the European war or, had they heard, felt that the informers were attempting a joke upon them. The French were making a suzerainty upon them now, as in so many parts of northern and middle Africa, but the folks of Metameur had no fair idea of where the French came from, and might have been satisfied by an official announcement that they had arrived direct from heaven. A place and people so completely, sublimely detached from the overbearing questions with which Europeans are oppressed—the Ruhr and all the rest—and from our consciousness that humanity in some aspects is deteriorating, were evidently well worth visiting. An Arab knowing the people and how best to reach them came into consideration, and he mentioned one interesting fact that

No. 700.—VOL. XIV.

[All Rights Reserved.]

further attracted me towards them, saying that near Medenine, where the people lived in the tubes which were the distant reproductions of the underground caves, there were variations of dwelling, all embracing the same idea of protection, and that one peculiarity was that until a few years back a small community, having detached itself like a section of a tribe, lived in caves cut out of stones and rock at the top of a craggy mountain with a sharpish peak overlooking Medenine, the situation being highly inaccessible, and seeming more desirable for eagles than for men. Getting there and back again was a business even for agile Berbers who chose this place for dwelling, but it troubled them the less because, being, like so many other communities in these parts, almost completely self-contained in the matter of means of living, they seldom found it necessary to descend. Now an item of information concerning these cave-dwellers of the clouds, who had thus come by such a peculiar evolution from the others who lived in the bowels of the earth, was that one of the special enjoyments they derived from their situation was absence of interference from even the slight evidences of an impinging civilisation that were already bearing upon their friends, the troglodytes on the lower level, and their sense of the value of this immunity was such that upon a sudden occasion, partly in resentment, partly in fear, the people of these mountain-tops had at last deserted their caves, all of them, and had fled somewhere farther south, away into an unknown, untracked, unmarked. The immediate and only cause of their departure, let me state, was pressure of taxation. Some far-flung authority of the Bey of Tunis and his government had bethought himself that taxation should be levied upon these remote folks, and forthwith Arab officials went up to acquaint them of the determination and the extent of it. They made a display of books with ruled columns, and slight uniform on which crescents showed, and they had likewise guns. The dwellers on the heights knew little about taxation, and little could they be brought to understand it, the idea of state requirements being quite beyond their comprehension, while the palpable truth seemed clear to them that this was merely a new and

APRIL 26, 1924.

elaborated form of governmental robbery. So they felt that this was an extreme not to be tolerated. They were appalled; they felt their whole world to be shaking when they learned that the tax to be imposed upon them amounted to what would be in our money and values now about a penny per cave and family for a year. Having received the demand, these people took fortune by the tail, collected their goats and fowls, tied their few belongings to the backs of donkeys, and went down the mountain on the far side from that on which the first tax-collectors had ascended, and were never seen again.

* * *

The rough journey along the semi-desert track south-east to Medenine was less of a business than was expected. We passed by Mareth, where the Arabs, Bedouins, and the blacks were filling with water at the wayside well, which the French had made for them, the skins of young goats, all complete save the heads and lower parts of the legs, producing an odd effect when they were loaded with water. Also we passed Arram, sometimes called the Land of the Marabouts, where in semi-desert solitude five marabouts or small, domed praying-places are clustered together. Pilgrims come here from long distances; casting shoes, I was, by a rare privilege, allowed to enter the marabout of Zel Abd Din and see that for which they came. Bedouin camps in numbers were passed all along the way. At intervals there were flocks of goats and camels, eighty or a hundred of the latter together, grazing upon the rough and very scanty herbage presented to them. Small camel caravans were passed, and there were single riders on fine Arab horses. The hot weather was coming, and some of them wore the big expansive straw headgear common down this way, with a brim span of nearly a yard, patterns sometimes worked upon the straw. We crossed a dry river-bed which marked the division between French civil and military control. Presently we perceived a pyramidal cluster away to the right, and we cut across to it. This was Metameur, a gentle introduction to Medenine, the habitations being constructed on the same principle, with the difference that more than two layers of holes or tubes are seldom laid above the ground floor. Life is lived slowly at Metameur; the people drowse about; their vitality is poor. But outside the crudest thing in native cafés there were young men sprawling on benches and on the ground, playing a game of cards. Half of one of the streets—to flatter them with the name—was in a state of ruin, the tube-houses having collapsed through recent heavy rains. A new and special frontage had lately been attached to one of the habitations and a post-office made of it. Thus the world goes creeping in to Metameur. Hot as it was, the men were draped not with cotton, but had heavy blanket burnous about them, drawn over their fezed

heads as well. We went on to Medenine, with a sense, after experiencing Metameur, of approaching a great city. Here the principle or system of the tube habitations is carried out on the most extensive scale. There are thousands of them, laid sometimes in four or five rows upon each other, and in one case they make a long winding avenue. Viewed from a height, this collection, which is called the 'ksar,' gives exactly the impression of big tubes or drain-pipes piled one on another, with the spaces between them filled up. But when I am on the level again and feel dissatisfied with the description of a form of dwelling-place which, in its extreme simplicity, seems somehow most difficult to describe in order to produce a picture in the mind of the reader, I bethink myself of the rows of catacombs that one sees by the roadside in Sicily and many other places, just holes at the entrance to pass the bodies in. These habitations at Medenine, made for the most part of stones held together by puddled earth, seem almost like that. Let the point be remembered that in some way these things are an evolution from the holes in the ground. Each habitation consists of the one chamber to which admission is given by the main opening or entrance, which is not more than two or three feet in height, and is closed by a rough form of door. I entered some of them; the inmates regarded the intrusion with indifference, and scarcely turned from their drowsing on some straw or rags in a corner. The chamber is often little more than the height of a man, and sometimes not that, nine or ten feet in width perhaps, and about twice as much in length or depth. The sides and vaulted top usually consist of whitened earth, and there is no light save that which enters at the door. In those to which I was admitted there were no seats, tables, or beds. Floors were earthy and dirty; along the sides were a few vessels and some straw. Here would a family live and even work, and the accommodation was far inferior to what might be yielded by the meanest stable I have seen. And yet, though I have said their vitality appeared low, it did not seem superficially that these people were unhappy. They lived on here for generations; they rarely sought emigration; they half-disdained the foreigners who came along; and I am sure that any offer to take even their young men back with me would have been refused. The attitude towards life of people who dwell in such places, upon whom civilisation has so far impinged so little as not to make them believe in it, is that they had better bear the ills they have than fly to those unknown.

* * *

Outside a few of these constructions there are rough dilapidated staircases, but access to upper chambers is most frequently gained in simpler fashion by means of footholes in the wall and small projections clasped with the

hands. In this way the higher residents—men, women, and children—climb to their abodes as monkeys might. I have seen them display remarkable agility, and also a pretty skill in balancing when, having scaled their particular height, they came to unlock the door. The key is a smooth stick of hard wood about a foot in length, an inch and a half in width, and a little more than a quarter in thickness, and at one end there are, at irregular intervals, a number of projections, small and thin, and again made of hard wood, a particular arrangement for each key and lock. At the right-hand side of each door is a hole in the wall through which the owner thrusts his arm with the key and instantly fixes the projections in the places for which they were meant, causing the release of a bolt or bar. It seems easy, but there is a trick in the application of the key, and, much as I tried, I could not unlock these doors with their proper keys, though the owners strove to show me how, not fearing that I would return by night to steal the olives or other goods. Perhaps when next I go to Medenine, soon though it may be, I shall find some changes. This place has an increasing importance now, one that was not thought of by the natives. It is near to the Tripolitan frontier, the last French military post in this direction, and it is not to be assumed with certainty that relations between different nations of Europeans in these parts will always be completely happy. Difficult questions are already arising between the French and the Italians, and in the future there may be more of them, for it has become the way of the world to seek for trouble and not to shun it. The French military establishment here, small though it be, is a matter of importance. Walking towards the market-place, I notice that the name of Rue Capitaine Bourelly is given to the rough thoroughfare leading to it, and it is not difficult to guess what the brave Bourelly did. Such market-places are typical of the French colonising and administrative system, and honour it. Here is a square surrounded by arcades of natives shops, all well constructed in something of a modern Arabic style, and in a place adjoining I see new sheds that have been recently built. There is no trick of civilisation that appeals so quickly and effectively to the raw minds of the natives, whose first instincts are of a commercial kind, as a market-place where better business can be done than in their old way. And then the order and the system of the market-place, the new and progressive atmosphere about it, promote the civilisers' object most effectively. In travels over all North Africa I have been impressed by the quick attention given to the market-place by the French authorities.

* * *

Another day I turned down more directly south of Gabes, wishing to reach the land of

the Matmatas, as it is called, where the natives live upon a different system, and are real troglodytes, dwelling in holes in the earth. The track was rougher and soft-sandier than that to Medenine, and the going was difficult at times; while at one place we contemplated the situation from which only a few weeks before the post diligence had been attacked, with three or four fatalities, by a wandering band, perhaps of Touaregs, the wild and most enterprising race whose main headquarters are by the Hoggar, far down in the central Sahara. This, however, is in passing, and only indicates that the farther one goes down in Africa, with progressive discomfort, the more one wishes to penetrate. The lure is strong. The taste acquired and desire existing, one always finds that movement and progress along these desert tracks comes easier than had been imagined. A generation back, when it was a case of camels only and a company of native soldiers for protection—and quite doubtful at that—in order to reach the Matmata country, where few besides the small French military posts had ever been, it was considered a grand achievement to make this journey. The Matmatas are far out at the end of this lonely track, some forty-five kilometres south of Gabes. Having come up to a range of low hills, which for long had framed the plain, we passed through a defile which was the entrance to the Matmata country, a district of heaving sandy hills. One became subtly conscious of being already in populated parts, in perhaps a sort of town, but nowhere was there any indication of the fact. Certain holes in the sides of the hills had as yet no meaning for the stranger. But in about half-an-hour or less we noticed a few fig-tree plantations and olive gardens, and soon were at Kalaa Matmata, the capital of the Matmata country. It is stated that in this country there are about five thousand people, and that they are engaged in industries, and so one might have expected to see signs of life, even if no smoking chimneys. But there are none, except a few children, scantily clad, now and then carrying jars of water taken from the cisterns that collect it. Here all about is a great, uneven, sandy waste, with a palm-tree standing here and there in a lonely way and patches of desert herbage sprinkled over the surface. Soon, however, a mosque is perceived, unmistakable in its whiteness, with minaret and dome, and elsewhere, smaller and less prominent, there is a Jewish synagogue. These, with a new market-place, well-equipped as usual by the French, are the only buildings visible above the surface. Faintly discernible tracks seem to run through the sandy mass, and then it appears that there have been levellings in places, but nothing built or constructed. But at last by acute and concentrated vision some holes are discovered, big enough

for a man to enter, sometimes packed around with a few stones, and invariably let into the side of a bank. These are entrances to the homes of troglodytes down below the surface, where all the people, the Matmatas, live.

* * *

I was enabled to make friends with some of the chief troglodytes, and descend to their homes. The men, who have a pride in their condition, and are attired sprucely in clean white burnous, like the Arabs, with red fezes, are agreeable in companionship, with a modest and dignified mien; but the women, roughly clad in the customary indigo and red patterned cloth commonly worn by Berbers, hide from the white man's gaze. The dwellings are much like each other in system. Entering at the big holes outside, one passes along a gloomy gallery or kind of tunnel with a downward slope for thirty or forty yards, brushing past a donkey or a cow in the way, and emerges into the light of day again in a courtyard, as it may be termed, which is roughly quadrangular, perhaps twenty yards across, while the surrounding walls reach up for about fifty feet, attaining then the level of the ground outside. Thus the courtyard is, in effect, at the bottom of a huge shaft cut down from the surface, with the sloping gallery for an entrance. It would be too difficult either for unfriendly man or wild beasts to get into it from above, while in case of attack the gallery could easily be barricaded and defended. The yard, with plain earthen floor, and very untidy, is common property, and more or less of a general rubbish place. Here, in fine weather, much of the general cooking is done, and the young goats wander, the fowls go clucking, and the children play, the cow and the donkey also enjoying the freedom. This is nearly the whole world of a family of Matmatas; anyhow, it is all that matters. Holes in the surrounding walls admit to caves, those on the ground level being for general living purposes, while some above are sleeping chambers, reached by rough steps from outside. There may be four or five caves on the level, each being occupied by a family, the various families being closely related. In the case of some of the most eminent troglodytes there is tunnelling from one yard to another. The most curious feature of this system is the sleeping chambers, several of which I was permitted to enter, finding them all much about the same. They are bored out of the strong clay and marl, and are well shaped, semicircularly vaulted, and about ten feet wide and twice as long, with, of course, no light or air except from the entrance. The walls are whitened, and though remarkable in their primitiveness, these chambers, of which the owners are immensely proud, have a sort of neatness about them, and are, besides, museums as well as places for slumber. The

bed, looking at the first glance something like an altar or a tomb, is laid across the farther end, and consists of a kind of firm trestle of wood painted white, standing about three feet from the ground, and being about the same or a little less in width. It has neither end-pieces nor sides, but the whitened woodwork is done in a plain, cut-out pattern. On this arrangement some rough bedding is laid, and here the master sleeps with his clothes upon him, looking as he lies face upwards just like an effigy on an old-fashioned tomb. Near him is a rifle, and when he is prepared for sleep he lets a curtain fall between him and the entrance. There may be a little shelf or even a cupboard in this cave; but the strangest thing of all is the back wall facing the entrance, which is always given up to a grotesque kind of decoration, consisting of rows of common plates or pots, empty bottles of all kinds, chiefly such as have contained sauce or pickles, retaining still their original labels, and held to nails on the wall by bits of string. Fragments of mirrors make one of the higher rows, and at the top are gaudy-coloured prints of Parisian beauties which the occupier and his ancestors, with a taste for art, have acquired with difficulty through generations with the same effort, perseverance, and taste as enabled them to secure the sauce bottles and the pickle jars. Let it be remembered that until lately these things were rarities, and that they are still rare, for this is away from civilisation, and few travellers come here. Traditions of selection and arrangement seem to attach to these decorations, for I noticed that bottles, plates, broken mirrors, and pictures were always arranged in the same order. The people live upon what they grow and make themselves. The goat, the fowl, the corn—they are nearly enough, with olives and some slight vegetables. Sometimes one of the upper chambers not furnished for sleeping is given up to a donkey or other animal, and also to the storage of olives, which these people grow well, and sell or barter for other things. This is their main occupation, and they have a mill which is centuries old, worked by a donkey on the circular perambulation system. An aristocrat of the Matmatas, Mohamed Ben Haim Hallel, conducted me to his home, and told me things about his people. He was a fine, urbane gentleman, tall and erect, with a manner about him, and a conceit in his establishment. His burnous was spotlessly white, and his fez shapely and scarlet. He spoke in smooth and gentle tones, even as of a man of breeding. At the outward entrance to his domain, that which I have rudely called a hole, he pointed out to me a beam on which were signs that had been scratched by his ancestors, and these signified centuries. He was scion of a long line of troglodytes. Yet, of course, he knew nothing of any sort of reading or writing, could not imagine Europe or America,

regarded Gabes as the main centre of the universe and too far for him to travel to, and was finely content with his home in the earth, a chamber half full of olives he had grown, sign of industry and means, and the sauce and pickle bottles on his wall, tokens of his taste and culture,

to delight him in his reposeful hours. . . I thought of many things, going back to Gabes, and wild, rough place as it is, in an oasis of the desert, it seemed, as I entered it, darkness having fallen, the lights shining, that I had the emotion again of driving into Piccadilly Circus.

A GIPSY OF THE NORTH.

CHAPTER XVI.—UNEXPECTED DELIVERANCE.

WHEN next consciousness came to Mardock it was to find himself lying against the log wall of the house where Standifer had thrown him. His head ached intolerably, nothing in the room was clearly outlined in his vision, and he had only a dim recollection of the events that had preceded his lapse into unconsciousness. After a moment he rolled over and sat up, supporting himself against the wall. The room seemed to be half-veiled in mist, and, rubbing his eyes, he stared round again. The veil was still there, but he was able to make out that he was alone in the room, and that the house was unutterably silent.

His mind groped for the explanation of what had befallen him; and presently he remembered that he had been drugged, and that Standifer had leaped across the table as the girl had given him the pistol he had asked for. Where was Standifer now? And where was the girl? And Arloff, who had asked him how he liked the coffee, smiling like the villain that he was, whilst he had waited for the dope to operate?

The questions had scarcely shaped themselves, and he was still wondering, when there reached him a subdued chant of many voices. He listened in surprise. It was like a psalm unaccompanied by—

‘My God!’

The whisper broke from him hoarsely as the stunning truth came to him. They were in the church. The marriage from which he had promised to save the girl was even now taking place. A groan broke from him—then the thought leaped in his mind that even yet he might be in time. Even at the worst he could kill Standifer. He tried to rise to his feet, but could not until he had first crawled to the table, and by means of it raised himself.

Then, holding to the table, he tried to steady himself. His heart was beating most irregularly. The drug he had taken in the coffee seemed to be acting in waves. One moment he saw clearly, and the next moment his vision was blurred, whilst there was an intolerable drumming in his ears. He was not sure that he could walk; but he knew that he must try. And if he could not walk, he would crawl. He looked round for some weapon, and between the waves of dimness caught sight of the rifles in the corner, which he had forgotten.

One inarticulate sound of exultation broke from him as he saw them, and, making a great effort, he reeled towards them. His feet did not seem to be his own; he was conscious of intolerable weakness, and had a feeling that he was falling with every step, but he reached the rifles. He picked up one, his own. He knew that it was loaded, but he opened the breech to make sure; then, with one hand on the wall to steady himself, and using the rifle like a staff, he began to move towards the door. Just before he reached it something that gleamed caught his eyes, and he stared at it thoughtfully. It was an axe hanging by a leathern thong.

A new idea came to him. Weak as he was it would be hard work to make the church, and with his eyesight playing such odd tricks he might not be able to do what he purposed. But there was Carwyke—

Without finishing the train of thought he took down the axe, looped it over his wrist, and made for the door. He opened it with an effort, and looked out. There was no one in sight, but the chant still rolling from the church told him where the natives were. He laughed weakly, and stepping outside, still supporting himself by the logs of the house, made his way to the hut behind. The sentry was no longer there, and he guessed that like the rest of the tribe he must be in the church. Again he laughed, and, setting his rifle against the cabin wall, attacked the padlock with the axe.

The first blow he struck missed the lock altogether, and the second, though it was no very great blow, twisted the axe from his weak hands. It fell to the ground, and he stooped to recover it; and as he did so, overcome by dizziness, he crashed to the earth. Groping, he recovered the axe and strove to raise himself. But he had got no farther than his knees when he was startled by an apparition that came out of the woods immediately behind the village. He rubbed his troublesome eyes to make sure that what he saw was not a hallucination born of the drug which had been administered to him. No! the half-naked white man with a bandaged shoulder running towards him was real enough, and now he was quite near and was speaking to him.

‘What have yo’ done with ther girl an’ Mista Carwyke?’

He stared at this wild-looking figure, and recognised it. 'You are the Eskimo——'

'Where's Mista Carwyke an'——'

Mardock pointed to the hut, and the newcomer snatched the axe from his hand and attacked the lock. In three blows the staple that held it was smashed off, and the door was thrown open from within. The first to emerge was Bull, who stood blinking in the light. At his heels came Carwyke, who stared at the half-naked man, and then whispered unbelievably, 'Billy . . . Billy, is that you?'

'Yep? Where's Miss Norma?'

'I don't know, I——' Carwyke's eyes fell on Mardock, still on his knees, and he asked, sharply, 'Where is the girl?'

'In the church. . . . They are marrying her to Standi—— Oh, take the rifle there!'

Carwyke, already beginning to run for the church, leaped back, snatched the rifle from where it leaned against the wall of the hut, and then ran forward again at the heels of Eskimo Billy. They reached the entrance together and looked in. The place was full of natives squatting on rude benches. In front of the altar, with its candle-lit eikons, was a little group—a man and a girl, the man Standifer supporting the girl's drooping figure.

Just beyond them was a form in such splendid trappings that for the moment Carwyke did not recognise it for that of Arloff. The reprobate priest was in gorgeous vestments of silver and white; a jewelled cross of gold hung on his ample chest, and on his head was a gilt mitre studded with coloured stones and pearls. Carwyke stared at the gorgeous figure in wonder; then, as the priest half turned to the altar and the candlelight fell on the gross face, he made the recognition. As he did so a scarcely human sound broke from the half-naked man at his side, then a hoarse whisper—

'Ther Russian! I thank thee, God!'

Carwyke's mind had scarcely grasped the significance of the whispered words when the ex-whaler's rifle cracked; and as the flying death took him Father Arloff crashed in front of the candle-lit altar which he had so disgraced. A single startled cry from a woman's throat followed the shot; then for a moment there was deathly silence, during which Carwyke saw Standifer's astonished face, as, with Norma in his arms, he looked over his shoulder to learn who had fired the shot.

At once pandemonium broke loose. The hoarse guttural shouts of men mingled with the shriller cries of women, and in a mass the coppery-hued congregation rose from the packed benches and surged towards the door, shouting or shrieking as it came. The two white men in the narrow doorway would have been utterly helpless in the face of that rush had they waited for it. But they did not wait. Just as it began Carwyke gripped the ex-whaler's arm.

'Quick, Billy—this way! We must get Norma.'

He led the way at a run round the church, guessing that there must be another entrance at the altar-end. A small wooden porch caught his eyes, and for that he made; and just as he reached it, it was flung open and Standifer appeared, carrying the unconscious Norma in his arms. He stopped as he saw Carwyke and the half-naked Billy, and an oath broke from him.

'You——'

Carwyke slipped up to him. 'Give her to me!'

'I'll see you in hell first.'

Carwyke did not argue. There was no time. He took hold of the senseless girl, to drag her from the other's arms; but Standifer held her firmly with one arm whilst his right hand groped for the pistol in his belt. Before he found it Billy slipped behind him and jabbed at him with the butt of his rifle, and as he fell Carwyke dragged the girl from him.

'The canoes!' cried the prospector, as he turned towards the river. Next moment, when he saw the empty landing-place, a cry of dismay broke from him.

'What is it, Mista——'

'The canoes are gone. We are trapped!'

'Then make for ther house,' said Billy. 'I'll hold ther beggars back.'

(Continued on page 363.)

HOMESICKNESS IN THE TROPICS.

THE hot white ground is trembling in the sunshine,

The hot blue sky is burning up mine eyes;
My parched lips ache, my fevered soul is yearning,
Yearning for soft gray skies.

Oh for a cloud to hang upon the heavens,
A cool gray northern cloud to veil the blue!
Oh for a puff of wind from heathered mountains
That glisten with the dew!

Oh for a mountain river, wild yet playful,
With wise trout lurking in a shady pool!
Oh for the gray sunur drifting up the valley,
So soft, and moist, and cool!

Oh to lie down amidst the dew-damped bracken
(The little fleecy clouds sail past so near),
To watch the gloaming fall o'er hill and hollow,
To watch the stars appear!

Then to arise, and wander slowly homeward
Beside a burn whose prattlings never cease;
The dew upon my face and on the heather,
And in my bosom peace.

I long to hear the mother-sheep's sad bleating,
The wind among the pines, the curlews' cries.
My body aches, my soul is sick with yearning
For cool gray northern skies.

D. E. STEVENSON.

THE ART OF MAP-MAKING.

CARTOGRAPHY AND THE BRITISH EMPIRE EXHIBITION.

By GEORGE PHILIP, F.R.G.S.

I.

THE British Empire Exhibition at Wembley, in presenting the most comprehensive display that has ever been made of any nation or empire's wealth and resources, does not neglect the progress of our vital sciences or a comparison between our present achievements and the rude beginnings of the ancients in mapping the world.

The history of the art of map-making, which marches with the story of the gradual unveiling of the geographical horizon through discovery and exploration, falls naturally into five periods. Of the first, dating from the earliest times to the beginning of the Christian era, we have only vague records of maps of a conventional and primitive type, no traces of which now exist. In the second period, extending down to the twelfth century, the chief cartographical records are to be found in the hand-drawn maps accompanying the earliest known editions of the eight-volumed Geography of Ptolemy (150 A.D.), based on mathematical principles to a large extent derived from his predecessor, Marinus of Tyre (c. 120).

The mediæval period of map-making, ending on the eve of the great age of discoveries, was one of retrogression. Although the learned—among them Roger Bacon (1214–1294)—still clung to the scientific theory of the sphericity of the globe, this doctrine was regarded as heretical by the Church; and as the principal cartographers of the period were monks, the most characteristic maps were the so-called circular 'Wheel-maps,' of which the specimen in Hereford Cathedral, drawn by Richard of Haldingham about 1280, is an interesting example. Other mediæval maps were rectangular in form, such as the ninth-century Anglo-Saxon map of the world in the Cotton MSS. at the British Museum. The famous globe of Martin Behaim, produced in the year of the discovery of America and still existing at Nürnberg, may be regarded as the final specimen of cartography of this period, for though finely executed in colours, it follows all the current misconceptions of the time, and makes but little use of material then available, such as the explorations of Marco Polo, Conti, or the Portuguese navigators.

In striking contrast to these purely conventional maps prevalent in the period were the wonderfully accurate coastal charts which had been in use among the Mediterranean mariners from the days of the Crusades. These charts—known as Portolani—were based upon estimated bearings and distances from port to port; and in the next period (from the discovery of

America to about the end of the eighteenth century) their accuracy was still further increased by the introduction of the magnetic needle for taking bearings, and the use of the cross-staff or astrolabe for observing latitudes. An army of marine cartographers sprang up in the Italian and Catalonian sea-ports, and their charts formed the groundwork for the better general maps of the world and globes, which about this time began to be issued.

As many actual specimens as possible of these antiquities of cartography, and, where the originals are not available, accurate reproductions, are on view at the British Empire Exhibition. A study of them serves to increase our wonder at the achievements of the age of discovery. Such maps and charts would serve merely to confuse a modern traveller, yet our forefathers trusted in them, and by some miracle journeyed and came home. It was in the latter half of the eighteenth century that maps began to be printed from woodcuts. Later, copper engraving superseded the use of woodcuts, as copper plates were found to be a better medium for securing a higher standard of engraving, besides affording far greater facilities for keeping the plates up to date.

The application of printing to maps naturally gave a great impetus to their production. Waldseemüller, the foremost cartographer of the early sixteenth century, published a series of maps, including a large twelve-sheet map of the world, and among English map-makers of the time may be mentioned Lilly and Lluyd of Denbigh, who both issued maps of the British Isles. A little later Antwerp and Amsterdam became the great centres of map production, and the atlases of Mercator, Ortelius, Waghenauer, Hondius, Jansson, and Blaeu, and those of the French firm of Sanson, were the chief cartographical publications of the sixteenth and seventeenth centuries. The only noteworthy British map-makers in competition with the Dutch cartographers were Saxton and Speed, who produced atlases of the British Isles, and Pont and Gordon, who issued a map of Scotland, while Halley the astronomer compiled, in compass variation and wind charts, two of the earliest cartographical contributions to physical geography.

In the following period, beginning with the eighteenth century, French map-makers at first took the premier place, especially Delisle and D'Anville; their chief British contemporaries being Desbarres (for coastal surveys—notably those of Captain Cook), Jeffreys (for American maps), Rennel (for maps of India), and Arrow-smith.

Although Hondius had founded a geographical establishment in Germany in 1702, it was not till the beginning of the nineteenth century that that country became the headquarters of scientific geography, a position which remained unchallenged until recent years.

II.

If, as this brief survey has pointed out, British contributions to the development of cartography, except in the realm of exploration, have been remarkably slender in the past, it is gratifying to be able to claim with confidence that the enormous strides made by British cartography in recent years have at least placed it on a level equal to that of the Continent.

This satisfactory result has been attained because British map-makers have availed themselves equally with, or even to a greater degree than, their continental competitors of the advantages and materials for scientific work denied to their predecessors of even a hundred years ago. What they have achieved is displayed in the British Empire Exhibition.

In our own times the achievements of scientific exploration have solved almost all the remaining problems of geography, the rapid extension of topographical, geological, marine, and other surveys, and the development of geography as the science that concerns itself with all the activities of mankind, have so enlarged the functions of the modern cartographer that he is called upon to produce not only maps delineating accurately the surface features of the earth, but also maps illustrating all the infinite variety of its physical, climatic, political, and economic factors and phenomena.

Further, the technical processes of map production have been enormously improved of recent years. The invention of lithography and chromolithography—the art of drawing and engraving on stone—in the beginning of the nineteenth century, and the printing of maps drawn on ‘lithographic’ stones in a power-press, as a substitute for the old laborious process of obtaining impressions from the copper plates by the use of the hand-press, led to a great expansion in map production. More recently zinc and aluminium plates have largely taken the place of the heavy and costly lithographic stones, with their liability to fracture; the letterpress machine has been applied successfully to map printing, and various photographic and other processes—such as the art of cerography or ‘wax engraving’—have been adopted in place of the slow and costly method of copper engraving, effecting an enormous saving in production both of time and of money. Lastly, one of the beneficent results of the Great War was to stimulate the study of maps among the general public, and to lead to the invention of still more practical methods in map-making.

For, immediately the ‘war of movement’ was

superseded by trench warfare, the pressing need for new maps on a larger scale than any in existence was realised, and mapping from air photographs, and other new and interesting processes of map construction, to produce maps in the quickest possible time, were devised, exhibiting with the required detail the labyrinth of trenches, craters, dug-outs, dumps, railway, road, and waterway communications in the fighting zones; and also to meet the needs of modern scientific warfare for such purposes as shooting by the map, and the abstruse methods of artillery and sound ranging. It is a matter of pride to British cartographers to know that in meeting the demand for such maps our artillery map-makers showed greater resource than the Germans in applying new methods to map construction, and were able to produce the best maps issued in the war.

It is, however, not only in the production of military maps that modern British cartographers, as the British Empire Exhibition will show, challenge the pre-eminence of continental, and notably of German, map-makers. The British Ordnance Surveys, the first of which was started in 1791, in their range and technical qualities, are the best in the world; the Indian and other Government surveys of the Overseas Dominions, so far as completed, equal those of most European states; and through the activities of the topographical section of the General Staff, an invaluable series of reliable maps of the scattered portions of the British Empire is in course of publication. In marine cartography the British Hydrographic Office has taken by far the foremost share; and the Admiralty charts, based on naval surveys, cover practically every coastline frequented by shipping, and are used almost exclusively by the mariners of every nation; while in the mapping of the ocean bed, from the records brought home by scientific deep-sea exploration, Great Britain has contributed the leading share.

When we examine the recent cartographical output of British private geographical houses beside those of their German and other foreign competitors, we find that the best of our maps, atlases, and globes need no longer fear comparison, as regards either scientific value or excellence of technical production. Indeed, in some respects, notably in a clearer presentment of geographical facts—physical, political, and economic—they may be considered superior; and it is probable that the British map-maker has been readier than his continental rivals to avail himself of the newer technical methods and processes of map production. Certainly he no longer needs to go to Germany for his technical appliances, the offset, rotary and other new types of printing-machines now produced by British firms being at least equal to those manufactured on the Continent.

It is sincerely to be hoped that the high

standard now attained by British cartography will be duly noted by visitors to the British Empire Exhibition. The Cartographical Section not only effectively illustrates the best work

of private map-makers, but also presents a characteristic selection of the varied map publications of our survey and other government departments.

MR IMTHURN'S ASSISTANCE.

PART II.

MR JARROCK, followed by Buffery, who had wrapped himself up well against the weather, came down the steps into the pelting rain. He flung his cloak round his shoulders, and, with a scowl at the butler, made off rapidly down the street. Here and there the pavement was in good condition, but in other places it lapsed into broken spaces, and into pools of mud, where one had to walk more carefully. Buffery, hugging a bag of gold beneath his overcoat, tramped along behind his leader, musing on his destination. At last the general trend of the road made him come to a decision.

'We're going to Pear Blossom's,' he said to himself, 'where young Lacy shot himself; and a dirty hole it is, too. Just the sort of place he would choose. Well, they won't play any tricks on me.'

The gambling-house called Pear Blossom's was a tall edifice standing over a dark and dirty coffee-house. A wide, once noble, staircase led upwards past a first floor, on which were mysterious rooms never opened to the general public, to a second storey, where were the gaming saloons. These were large and spacious, decorated with second-hand finery of the time of the first George. Mr Blossom himself was a small, one-eyed man, narrow of shoulder, but very obese stomachically. He had gained his sobriquet of Pear partly from his physical shape, and partly from a habit of conversation by which he was often emphasising his astuteness. 'If I had a pair of eyes, sir, a pair of eyes, I couldn't see farther into a brick wall than I do with one, sir.' The name had stuck because of its delicious unsuitability. There was nothing white and pink or spring-like about Mr Blossom. A wit had said of him that he was the match of that blossom which had eventually become the apple which Eve had eaten, but possibly at that moment the wit had been suffering from the result of one of Mr Pear's villainies. The clientele of the place was recruited from the middle class of the hordes who infected the ring-sides and the race-courses of those days. A few were broken gentlemen, who, having run through their money, now subsisted on mysterious sources, sometimes at the mercy of their creditors; but the greater part were self-made men, if, indeed, the act by which they had become what they were could be called 'man-making.' Mr Jarrock, who still had an entry to any circle he chose, was indeed a rank above the place socially; and Buffery,

though not a man of deep analytical powers, did, in spite of his former statement, wonder why Jarrock had led him here. He gave a glance behind, and noted that a dirty-looking fellow was slouching along the road, evidently in their wake.

'If it's games he's up to,' thought Buffery, 'we'll have to better it.'

Jarrock shouldered his way roughly through the tap-room, the customers of which gave to him the deference due from evil manners to those of superior chances. He clambered up the wide staircase, followed by Buffery. On the break of the second storey he encountered Mr Blossom. The proprietor, his missing eye covered with a black patch, stared at Mr Buffery with the one remaining eye from beneath a ragged eyebrow.

'Why, it's Mister Buffery!' he exclaimed. 'I haven't seen you for a long time.'

'No,' answered the butler, 'and I hoped you never would. I sha'n't forget young Lacy in a moment.'

'Better the way it was, maybe,' said Mr Blossom roughly. 'A man who can't take a downhill turn on the steady won't ever last the course.'

'That's true, perhaps,' said Mr Buffery, 'but I never could stand shooting. If he had to, I wish he'd done it at home.'

'Stow it, Pear,' interrupted Jarrock harshly; 'let's get to business. Here's the purse, and if it ain't made out of a sow's ear, it's as near as possible.'

'Go on in, go on in,' said the proprietor. 'Try Tom's table. There's a quiet game going on there.'

Though it was yet afternoon, the rooms were well populated. Rough men in fustian mingled with clean-shaven, sly-faced fellows in dandified clothing; there were women, too, crouching over the tables, flinging down their coins with affected boredom, or with genuine anxiety, but all gathering in winnings with eager fingers which seemed to grip automatically at the gold. The room stank of stale scent and of tobacco. Jarrock dropped into a chair at a roulette table, while Buffery dragged another to his elbow. Jarrock brusquely took the first rouleau of a hundred gold pieces, and, tearing open the paper, thrust twenty of them carelessly onto a number.

'On a single number?' ejaculated Buffery.

'Mind your own business,' growled Jarrock.

In five turns of the wheel Mr Jarrock had lost his first hundred pounds; in ten turns, two hundred; and in fifteen unlucky whirls three hundred sovereigns had left Mr Buffery's bag. A crowd was gathering to watch this gambler who played twenty pound stakes on single numbers with such an imperturbable air.

Jarrock dropped his last ten sovereigns of the fourth hundred by chance on to the number seven.

'All on,' shouted the croupier, and twisted the wheel with his fingers.

The ball spun round the cup, the colours and numbers painted in the divisions disappearing in a whirling sparkle of gray. The wheel at last began to slow down; as the colours began once more to be visible the ball clicked, and the wheel came to a stop.

'Seven wius,' cried the croupier.

Jarrock said something under his breath. Mr Buffery, who had been drawing the fifth rouleau out of his bag, looked up. He noted that Jarrock had won, and a line of puzzlement creased his forehead. The word he had heard Jarrock utter was undoubtedly a curse. The croupier was about to hand Jarrock his winnings, but the latter cried, 'Leave 'em all on, Tom.'

Once more the ball began its race about the polished ebony bowl of the roulette. Once more the sharp click announced that Chance had again put down her finger.

'Seven wins,' cried the croupier.

The pile of gold which Jarrock had won now spread beyond the limits of the square on which the number seven was painted.

'See if she will win again,' cried Jarrock, in a voice of annoyance.

'Can't do it, Mr Jarrock,' answered the croupier. 'It's over the limit. And he thrust the pile of gold in front of the scowling gambler.

'Don't he want to win?' said Buffery to himself.

Jarrock clutched out a fist-full of money and banged it down onto a chance number. Mr Buffery at his elbow was gathering the sovereigns into piles of fifty. When he had eight piles he took from his pocket squares of paper, and methodically began to roll up the coins into rouleaux.

'Damme! What are you fiddling at? You annoy me!' exclaimed Jarrock.

'Why, sir! I am taking back Mr Imthurn's advances,' said Buffery. 'He only stipulated to pay your losses, if you remember, sir.'

'Why can't you wait till the end?' growled Jarrock. But by this time Buffery had completed his rolls, and had slipped them into his bag.

The croupier, too, had been watching this action, the while neglecting to spin the wheel. He now called out, 'What the devil is he doing?'

'Oh, it's all right, Tom,' said Jarrock angrily; 'the old devil's only skimming back his advances.'

'Well, see that he don't take more than he lent,' said the croupier, and went back to the game.

For two rounds Jarrock lost, but once more a lucky chance brought him another pile of gold; by leaving the money on the same number he again brought off the double.

This time without doubt he cursed.

'What is the matter?' wondered Buffery. 'He must be in a couple of thousands, and here he is a-cursing like anything. He can't wish to lose, yet it looks like it.'

Jarrock continued to win. Playing as he did on single numbers, of course, he failed many a time; but, after a run of bad luck, invariably one or two wins would more than recoup him all his losses. Strangely enough, while he was winning, his face was black and scowling, and this devilish expression only left him after a series of six or seven losses. From time to time he glanced eagerly at the clock. The half-hour had passed, and slowly the minutes dragged along towards the three-quarters. Jarrock began to play on eight or nine numbers at once.

'He's gone mad,' thought Buffery.

But of the several numbers one turned up, and Jarrock was richer than before.

At last Buffery dropped the bag of gold into the deep pocket of his undercoat. He gave a sigh of relief, and buttoned himself up against the rain which still beat on the windows, and against the wind which howled mournful songs in the trumpet of the chimney.

He stood up. 'Mr Jarrock, sir, I must be going,' he said. 'The three-quarters to five is past. I'll be glad to tell Mr Imthurn the successful result of his advance, sir.'

Mr Buffery bowed in his stilted manner to the room, and walked solemnly between the tables to the door. There he met Mr Blossom, who scowled. 'You got off cheap this time,' said the proprietor.

'Why, yes! I'm glad to say,' agreed Buffery, 'and no tragic occurrence neither. It almost takes the taste of the last time out of one's mouth. Though this one isn't a favourite of mine, so to say!'

'Jarrock's a damn fool,' growled Blossom savagely.

'He's a lucky one to-day,' said Buffery, and began to let himself down the staircase, slowly, because going downstairs caught his rheumatism.

After Buffery's departure Jarrock sat staring with a forced grin at the pile of gold before him. Then he jumped to his feet. 'Watch this, Tom,' he cried; 'I've got to speak to that fellow.'

'You bet I'll watch it,' answered the croupier. 'You bet I will.'

Jarrock went rapidly out of the gaming-room, and caught up with Mr Buffery on the first floor landing.

'Oh, Buffery,' he said, 'I must have a word with you.' He went to a door which, with a wrench, he flung open. 'Come in here, come in here,' he said; 'you needn't be afraid.'

'Oh, I'm not afraid,' answered Buffery complacently. He pulled out a large watch from his fob. 'But I can only give you five minutes, Mr Jarrock. Not a second more.'

Jarrock urged him into the room with jerky abrupt movements. He then slammed the door, turned the key, and began to pace to and fro, snapping his fingers. One could see that he was trying to gain control over a rage but half-subdued. Mr Buffery moved to the window. The tall panes were dirty, but he noted that the rough-looking fellow who had followed them in the street was stationed near the coffee-room door.

'If it's games he's up to——' said Buffery to himself; 'but why?'

'Look here, Buffery,' said Jarrock; 'how much do you want for that seven hundred and fifty?'

'Why?' cried Buffery, amazed; 'what do you mean, sir? Here you are, winning three or four thousand. What do you mean?'

'That doesn't matter,' cried Jarrock. 'I can't tell you everything. Come now—halves.' He stopped and stared Buffery in the eyes. 'Halves,' he repeated, 'or—come, you give me three fifty, keep four hundred for yourself.'

'But I don't understand, sir,' replied Buffery; 'why go out of your way to commit a useless crime? You're up several thousand. Why rob Mr Imthurn of a miserable three hundred or so?'

'Blockhead,' shouted Jarrock, losing control of himself, 'what does it matter?' Suddenly he realised that by this path one would get no farther. With an effort he changed his tone. 'Look here, Buffery,' he said in a more genial voice; 'I see that I'll have to be frank with you. That was a plant, that game. Of course, everybody knows Mr Imthurn's silly notion, so as I was hard pressed for money, Blossom and I put it up between us. I was to get the cash and lose it deliberately, playing on single numbers. We were to split, for him three fifty, for me four hundred. Damme, it's true that I want the money. I want it badly. I'll tell you straight enough it's prison if I don't get it. I wouldn't have played such a rotten trick, else. I gave Imthurn a chance, but he wouldn't take it, so I had to go on. But now I'm desperate. I tell you I must have the money. By Gad, sir, did you ever hear of such infernal luck? Did you ever see such a dirty piece of irony? I haven't played a game like that for years. Can't you understand what I've been through?'

'If you'd been honest you'd be a rich man,' said Buffery stolidly.

'What's the good of saying silly things like that? My God, I could tear you to pieces. And you looking on, like a fat pig, and grunting contentment, while all the while I was in reality losing, losing—oh, curse luck! No, look here, Buffery; I didn't mean all that. Come now, be sensible. Let us split the money. There isn't a ghost of a chance of your being caught. Imthurn will never know, can't know. You'll be four hundred to the good. Why, man, I'll even let you into my other game; you'll be a rich man. I tell you I'll make you richer than you ever dreamed of becoming, if you'll only let me have the three hundred or so to tide me over.'

'Why don't you get it from Blossom, if it's all you say?' answered Mr Buffery.

'Blossom, Blossom! Don't be a fool. Blossom wouldn't give sixpence to pay his grandmother's fare from hell to heaven.' His face took on a dark, threatening look. 'Look here, Buffery, I'm desperate. I tell you that you won't leave this room till I've got the money.'

Mr Buffery in answer stepped to the window. It was a tall French affair, and he wrenched it open.

'You can't get out that way,' cried Jarrock, with a sneer.

'Hi!' called out Mr Buffery to the street. The dingy loafer started from his lounging position. 'Catch!' cried Mr Buffery. Before Jarrock could impede him, he dragged the bag of gold from his pocket and tossed it down to the man, who caught it cleverly despite its weight. The loafer slipped the bag into his pocket and made off.

'What the hell are you doing?' shouted Jarrock, gripping Mr Buffery. 'Are you mad?'

'Why, no,' answered Mr Buffery, smiling serenely, as he shook himself loose from Mr Jarrock. 'That is one of my lads. I take him with me for safety. And now, Mr Jarrock, since the money isn't here, and since neither of us can give way to temptation, I'll say good-day to you, sir.'

Mr Jarrock glowered at the placid butler. He clenched his fists. 'I've a mind to give you a good hiding first,' said he.

'Why, sir?' answered the butler. 'Would it be worth it? The lad will come back with assistance, and I can keep my mouth shut without being killed. I'm sorry that I cannot give Mr Imthurn the good account of your winnings that I had hoped. But at least I can congratulate *him*, because the result to him is the same, sir.'

Jarrock, biting his lip, glowered at the placid man. Something in the butler's poise struck him. 'Were you ever a fighter?' he asked suddenly.

'Why, yes,' answered Mr Buffery; 'in my

young days I did do a bit at it, sir. Indeed, I was known as Battling Buffery.'

Jarrocks shrugged his shoulders, and opened the door. Mr Buffery, well muffled against the weather, coming out of the coffee-house was stopped by two men. He looked up, disclosing his features beneath the brim of his hat.

'It ain't him, Bill,' said one of the two.

It was now dusk, but Mr Buffery noted the uniforms of the men. 'No,' he said; 'if I guess right, it isn't him. But he's up there. You can get him, if you want him.'

'It's quieter this way,' said Bill's companion. 'Best to go quietly with nobs, and he is a nob, of a sort.'

'Ay,' said Buffery. 'Well, I'm glad I'm not him. It's a wet night to go to gaol, my lads!'

'We'll dry 'im as soon as we get 'im there,' said Bill's mate, with a coarse laugh.

'I'm sorry you can't take that pear-shaped one along too to dry,' said Mr Buffery musingly.

'He's too juicy,' replied the other. 'He'll last as long as he'll squeeze. Old Nick'll have the drying of him, I allow.'

Mr Buffery resumed his road. The wind buffeted him, and in spite of his wrappings the rain gathered in his hair and began to trickle down his neck. He could not get Jarrocks's desperate expression out of his mind. Suddenly he remembered the cup of bitter coffee he had made in the early afternoon.

'His drink's bitter enough at present, I should think,' said Buffery to himself. 'By Heaven, I wish now that I'd made him a really good cup!'

THE END.

LOOKING FORWARD.

By FRANCIS W. FARQUHAR.

WHATEVER they may be elsewhere, January, February, and generally March, are the most unpleasant months in northern lands. Green buds and snowdrops strive to cheer the disconsolate, but their beauty fails to atone for the cold wind and the bleak, colourless landscape. The days grow longer, and the light is hardly welcome, for it only serves to emphasise the nakedness of the fields; and country-folk feel inclined to draw down their blinds before the dusk comes, to blot out the dreary scene.

In themselves, these three months, with their wan sky and sombre earth, would appear well-nigh intolerable were it not for the fact that, as Mr Hardy has said,

Looking forward to the spring
One puts up with anything.

The winter solstice comes before Christmas, yet, once it is past, certain hopes, indefinite and half subconscious, inform the mind. Gales may sob bitterly among the bare branches, and the snow may lie deeper and deeper, but man knows that the year has turned, and nothing matters now. He puts up with anything and with everything. Spring is at hand; her arrival, tardy and delayed as it may be, is inevitable. Her harbingers have their charms, and their promise is not the least of their commendations. The fresh young sheaths in the hedgerow tell of the glories which are to be unfolded, while the chirp from the nest in the ivy sings of the days when the young ones will take their first crazy flight over the green lawn. Thus does Nature smite mankind with one hand and caress him with the other.

'Looking forward' is, indeed, the tonic which Nature herself prescribes for her children, and, if it be not abused, it is a medicine of greater

restorative power than is the brew of any pedant or quack. Many a grief is comforted, many a pain of heart or body is soothed, by the certainty that better times are coming. Just as the glow of a past happiness can warm the cold present, so does the beam of a future joy send a path of light across the waters; and the voyager is glad in the thought that ere long he will moor his ship in the haven.

Preparing for an examination may entail grinding toil and sleepless nights, but the student is patient, and derives energy and solace from the vision of the triumph that will be his when the last paper is completed and his name appears upon the board. The city clerk bends over his desk, and the miner hacks at the narrow seam; the brain of the one is fagged, and the sweat pours down the other's arms. Neither revels in his task, for it is dull, monotonous, and leaden. It is only the insistent looking forward to the day when enough money will be saved to render marriage possible, or to buy that little farm beyond the beechwood, that makes it possible to persevere.

Looking forward to the view from the summit helps to level the mountain track, but surely it is a mistake to live altogether in the future and to ignore the compensations of the present. Gazing at the shining towers of the distant city, the pilgrim trudges on stolidly, heedless of the glorious glen through which he journeys, and of the burn that bears him company. Anxious souls such as his may be fated never to reach their true goal, for no sooner do they achieve one aim than another beckons them forward on a fresh quest. There is a world of difference between ambition and discontentment, but it is not always easy to distinguish the one from the other. Nature's tonic must be used as sparingly,

and with the same discretion as the Arab's flask of water, or it will lose all its efficacy, and will aggravate rather than allay the parched lips. Looking forward is one of life's most precious possessions, and man should be ready carefully and thankfully to employ it when its succour is absolutely necessary—and only then.

Old men and women who read these lines may shake their heads in mournful scepticism and say, 'Tell us, to what can we look forward?'

The dreams of youth are not for us.' It is believed that life is a school, a training, long or short, for the mysteries that lie in the hereafter. Let those who are young 'put up with anything' in the hope that their lives may hold a prize, and, when things seem unendurable, old and young alike may well 'look forward' to that spring which, despite its mask of winter, will be the opening of a very wonderful summer.

THE MONTH: SCIENCE AND ARTS.

MOTOR ROAD-SWEEPERS.

OF the few remaining horse-drawn vehicles left, one of the most prominent is the road-sweeper. It is true that a beginning with motor road-sweepers has been made, but until quite recently the horse has reigned supreme for scavenging the streets of our towns and cities. Where motor road-sweepers have been adopted, big annual savings have resulted, that in the City of Westminster, for instance, being estimated at £951. The sweepers used, however, have been big, heavy vehicles; a lighter type has been lately developed which is very suitable for smaller townships, as with its tipping body it can be used for general carrying purposes as well as for sweeping. The chassis calls for little comment, being very similar to that for a two-ton lorry. A four-cylinder motor of 25 horse-power is fitted under the usual bonnet, behind which is the driver's seat. Next comes a side-tipping body with a capacity of 60 cubic feet or 90 cubic feet of wet or dry road-sweepings respectively. At the rear of the chassis is a tank which holds 150 gallons of water for sprinkling dry roads ahead of the brush. From this tank the water is supplied to a sprayer under the front of the bonnet by a semi-rotary pump having an adjustable stroke to vary the quantity. One of the most interesting features of this motor-sweeper is a species of elevator for lifting the sweepings into the body. This consists of three rotating brushes mounted one above another, in a steeply-inclined frame. The top and bottom brushes run in the same direction, but the middle one rotates the opposite way, the effect being to project the refuse upwards in a zigzag course, to be directed downwards into the body at the top. These conveyor-brushes run at high speeds, those at the top and middle turning at 308 revolutions per minute, while the bottom one runs at 370 revolutions per minute. The diameter of the two upper brushes is 20 inches, that of the bottom brush 24 inches. The road brush, which is 24 inches in diameter, and 7 feet 6 inches long, turns at 140 revolutions per minute. As the brush is fixed diagonally across the vehicle, the mud swept into the scoop travels

across towards the conveyer. This vehicle has a sweeping speed of 6·3 miles per hour and a travelling speed of 9·9 miles per hour, while it can proceed backwards at 2·9 miles per hour. At a test in Westminster, a street, 11 yards wide and 90 yards long, was swept clean in nine minutes. Other trials have been carried out at Newport with equally convincing results.

BOATS FOR ALL AND HOW TO LOWER THEM.

Every one is interested in the safety of ocean travel, if not on his own behalf, at least on that of relatives or friends. So long as ships run into each other, or are battered to pieces on the rocks, so long will passengers and crews have to depend for their lives upon boats and the means for lowering them. It is one thing to provide boats for all, and quite another to lower them safely into the water when they are full of people. When the *Volturmo* was lost by fire in 1913 it was estimated that 120 persons were killed or drowned in connection with the launching of the boats. What sometimes happens when the ordinary means for launching are used is that the rope tackle at one end jams, while that at the other continues to lower, with the result that the boat is up-ended, and the occupants are thrown out. This occurred when some panic-stricken and unauthorised persons attempted to launch one of the *Volturmo's* life-boats. Such are the risks and conditions in daylight, when this disaster took place. At night the dangers and difficulties are vastly increased. The men on deck who are lowering a boat cannot see what is happening to it, and the hiss of escaping steam, with the din caused by the wind and the sea, may render communication impossible. Finally, panic may prevail, under which condition only 'fool-proof' boat-lowering gear can be depended upon. The makers of a recently-brought-out device for launching boats from ships claim that it is as fool-proof as such a gear can be made. The predominating feature is the control of the lowering operation from the boat itself. Moreover, the control is dual; that is to say, if the man at one end sees some danger which is invisible to the man at the other, he can stop the gear. Similarly, should one man be dis-

abled or fall overboard, the other can continue the lowering single-handed. In fact, so easy is the operation, that it has been performed unaided by a little girl. Every reader of *Chambers's Journal* will be familiar with the curved arms, known as davits, from which the boats of a ship are lowered by ropes and pulley blocks. Blocks are used in the new gear, but there is only one pulley in each, and the rope is of steel wire, which has no tendency to twist and kink when wet, as is the case with manila. After passing through the upper block the rope from each davit is led to a winding drum, both drums being rigidly attached to the same spindle. At each end of the spindle is a band brake, which is put on by a lever. A rope from the end of each brake-lever is led over a pulley on the davit and is given a figure 8 turn round a cleat on the lower block, which is, of course, in the boat. All the men in the boat have to do is to ease away their brake ropes, which relieves the pressure on the brakes and allows the drums to turn, thereby paying out rope and lowering the boat. Either brake is powerful enough to hold the drums from turning; hence either man in control can stop the lowering by holding his brake rope. If one man meets with an accident and leaves hold of his rope, it simply pulls round the cleat as the other man continues the lowering. No one is required on deck, and if an attempt to lower a boat were made by unauthorised persons the gear could be jammed. It will be noted that both ends of the boat are lowered at exactly the same rate, no matter how careless or flustered the men may be. The brake ropes are made fast to their cleats when the gear is out of action, and any tendency of the boat to run down by its own weight only puts on the brakes harder. Means are provided for lifting the boat off the deck, and for raising a boat full of people; but from the passengers' point of view the safety of the lowering gear is the most important feature.

A SIMPLE REFRIGERATING MACHINE FOR COUNTRY HOUSES.

Every butcher of any standing has a cold store for preserving his stock in hot weather, and there is an increasing demand for a similar provision in private houses. The majority of these cold stores are kept cool by ice, but during the last year or two small refrigerating machines have been introduced which will not only keep a store cool, but will also produce ice. In such machines cold is produced by the evaporation of a volatile liquid which vaporises freely at very low temperatures. For instance, if the evaporation of ether be accelerated by blowing air over it, the temperature falls quickly to below freezing point. But to carry out this method without loss it is necessary to condense the vapour back into a liquid after it has done its work. Compression is required for this purpose, along with

exposure to cold water, to remove the heat which has been abstracted from the air of the cold store or from the water in the ice vat. Methyl chloride is used in a machine of this type which has been recently brought out. The apparatus is entirely enclosed, and will run for a season without attention. At the top is an electric motor which drives a small compressor through a vertical spindle, the compressor being situated in a chamber below the motor. Projecting downwards from this chamber is a big cast-iron tube, with gills on the outside for abstracting the heat from the surrounding air. In this chamber is another tube, which nearly fits it, leaving only a small space between the two. The refrigerating medium is drawn up by the compressor in a gaseous state from the evaporator or the tube chamber mentioned, and compressed to a pressure proportionate to the temperature of the cooling water. It then passes from the compressor to the condenser chamber, which surrounds the compressor casing (which in turn is surrounded by circulating cold water), and is condensed there. As liquid, the refrigerating medium flows through a pressure-reducing nozzle into the evaporator or tube chamber. This reduction of pressure causes the medium to become very much colder, and, owing to the reduced pressure, to evaporate, thus extracting a large quantity of heat from the surrounding air. In this way, cold is produced; or, in other words, the surrounding air is cooled down. The gaseous refrigerating medium is now once again drawn up by the compressor, compressed, and again compelled to perform the same circuit. The heat taken up by the refrigerating medium is given off in the condenser to the cooling water flowing round it. This cooling water is, therefore, indispensable for the working of the refrigerator. Before despatch, each machine is provided with a charge of methyl chloride and the necessary lubricating oil. It is then hermetically sealed up, as re-charging or re-oiling is entirely unnecessary. Moreover, the working parts are of so simple a character that it would be almost impossible for them to fail. A well-insulated chamber with a capacity of 35 cubic feet is maintained at a temperature of 32 degrees F. by the smallest machine, when working for ten hours a day, while it will also produce simultaneously 10 pounds of ice. Cold stores with capacities up to 1200 cubic feet are cooled by the larger machines. Electric fans are provided in the larger stores to circulate the air past the evaporator of the machine.

AN ELECTRIC NIGHT-LIGHT.

In these notes for last month a gas night-light was described which enables a dim light to be maintained all night at a negligible cost. The price of electricity being now so high, economy in its use is of even greater importance than in

the consumption of gas; and, as metallic filament lamps cannot be made of less than 10 candle-power for the usual voltage, electric night-lights are costly luxuries; moreover, they give too much light. The reason why smaller lamps cannot be made is the extreme fineness and fragility of a filament that will give a low candle-power on a 220 volt circuit. There is no difficulty in making tiny lamps for cars and torches because the voltage is very low. In a new type of electric night-light which has been brought out recently, the voltage is reduced by a device in the lamp itself. This device, known as a 'condenser,' consists of very thin paper, coated on one side with tin, which is wound very tightly into a coil, the whole being then insulated by being soaked in paraffin wax. One of these condensers is embodied in the new night-light, and the low voltage thus obtained allows of making a robust metallic filament for a very low candle-power—in this case only $1\frac{1}{2}$ candle-power. The lamp consumes but three watts per hour, which means that one unit (1000 watts per hour) will keep it burning for 333 hours—or, say, every night for from three to eight weeks, according to the time of the year—at the cost of a few coppers.

WIRELESS FOR SHIPS' LIFEBOATS.

It has been recommended by the Merchant Ship Advisory Committee that a proportion of the lifeboats of every passenger liner shall carry wireless transmitting and receiving sets, with ranges of at least 50 miles. Such equipments would allow of summoning assistance after a sinking ship had been abandoned, while, since a direction-finding device would be included, those in charge of the boats would be able to tell any ship in the neighbourhood which way to steer to pick them up. In view of the almost certain demand for such sets the Marconi International Marine Communication Co. Ltd. have designed a suitable weatherproof equipment, which the writer of this paragraph was recently invited to inspect. The instruments are contained in a case constructed of three-ply wood, which measures 2 feet in width, 2 feet 6 inches in depth, and 4 feet in height. To make it waterproof this case is covered with canvas, which is glued down and painted. Power is, of course, required for transmitting messages, and this is supplied by a $\frac{1}{4}$ -kilowatt alternator driven by a petrol motor of about 1 horse-power, the two being coupled together, and running at 4000 revolutions per minute. They are fixed in the bottom of the case, where they take up a very small amount of space. On the right-hand side near the top and at the back of the case is the transmitting set, while nearer the front is the receiving set. It must be understood that wireless at sea is carried on in the Morse code; the wireless telephone, with which many of our readers are accustomed to 'listen-in,' is not yet used in

ships, at any rate for communicating with each other. The transmitting set, therefore, is fitted with a Morse key. Having 6 valves, the receiving set is closely associated with the direction-finder, which is fixed in the left-hand side of the case. This takes the form of a coil, roughly 4 feet by 2 feet, which is cased in wood and mounted edgewise on a vertical spindle outside the top of the case. The spindle projects downwards into the case, where it is fitted with a pointer which moves round a disc marked with the points of the compass as the coil is turned. When signals are picked up, this direction-finder will indicate the direction from which they are coming within very close limits of accuracy. The signals are picked up in the first instance by a double aerial stretched between two masts that are fitted in the bow and the stern of the boat respectively. These masts fold down when out of use and when the boat is launched. The case for the apparatus is placed in the middle of the boat between two thwarts. Normally the front is closed up and padlocked, but when in use it is opened up, and the operator sits on the thwart with his feet in the case. As the front faces towards the stern of the boat, it is not subject to driving spray. Although this point has not yet been finally decided by the Board of Trade, it is expected that the apparatus will reduce the capacity of the boat by only two persons. These sets should enhance the safety of ocean travel, for which other recent inventions have done so much. In fact, we shall soon be almost safer at sea than on shore.

A WALKING-STICK BABY-CAR.

Although plenty of push-carts for children are made to fold up, they still remain too cumbersome to be taken on shopping expeditions which involve riding on buses or trams. A collapsible baby-car, having a weight of less than three pounds, has been invented recently, which bids fair to overcome this difficulty. The contrivance is kept extended by a walking-stick, which also forms the handle. When the car is looked at from the side, the stick constitutes the elongated back member of a frame, forming a triangular wedge, with its apex at the bottom. The top of the frame springs from a fitting through which the stick passes, spreading out to the front, where the two ends are joined by a round bar. From this top frame is hung a hammock seat of stout linen, in which the child sits. A foot-rest of three-ply wood is supported at the correct height by the axle and by two straps hung from the round bar. The front members of the frame connect the ends of the bar with the axle, on which is a fitting for the end of the stick. The wheels are about $8\frac{1}{2}$ inches in diameter, and are provided with rubber tires. The complete contrivance makes a comfortable and safe carriage for any child between the ages of $1\frac{1}{2}$ and 5 years. The frame,

wheels, and stick-fittings are of black enamelled steel. Thumbscrews hold the stick firmly in place; when these are unscrewed, the stick can be withdrawn and used as an ordinary walking-stick, while the top of the frame folds down between the front members, and the whole appliance is carried by the bar. An upholstered back is provided, this being fixed to the top of the frame in a convenient position to support the child's back.

A MACHINE FOR TRIMMING THE EDGES OF LAWNS.

After a lawn has been mown, it is necessary to trim the edges with shears if a neat appearance is to be achieved. This is an irksome task, and it is astonishing that only lately has a mechanical device been invented in which a revolving cutter driven by a roller does the work. In principle the action is similar to that of a lawn-mower, the grass being sheared off between a fixed knife and the rotating blades of the cutter. The roller, which is fluted and slightly coned, runs on the horizontal edge of the lawn. To one end is fixed a cutter in the form of a star, the blades of which overhang the roller. Both roller and cutter are mounted between the prongs of a steel fork at the end of a wooden handle which slants upwards to a convenient height. Also fixed to the bottom of the handle is a knife, the edge of which the blades of the cutter just touch. When the device is run along the edge of a lawn, the grass is sheared off between the revolving cutter and the knife. The roller, owing to its conical shape, keeps the stationary cutter part of the instrument closely in contact with the edge of the lawn. Provision is made for setting the cutters together when wear takes place.

A SAFE, LOW-PRICED HOME CINEMA.

Until the advent of a home cinema which was recently brought out, cinema apparatus has been somewhat costly, while the films could not be stopped at any particular picture for purposes of explanation because of the risk that the heat of the lamp would set fire to the film. The new instrument is sold at a very moderate price, and the lamp and the projector are so designed that the heating effect on the film when stationary involves no risk of setting it alight. With a length of only 20 inches, a breadth of 7 inches, and a height of 14 inches, this machine is very compact, while it weighs but 16 pounds. It gives pictures on the screen of from 4 feet to 6 feet wide. The various parts are carried on a cast-iron frame, which is screwed to a polished oak base. At the back are the two spools for the unused and the used film respectively. In front is a box containing the shutter and the intermittent-motion mechanism, which also carries the lamp and the projector. The machine is operated by a handle fixed directly into the central 8-picture sprocket, which feeds the film to the 'gate,' and afterwards passes it to the

take-up spool. The take-up spool is rotated by an elastic belt which slips easily as the reel of film becomes larger, and yet has grip enough to maintain a gentle pull. By removing the turning handle from the central sprocket and fitting it to the extended spindle of the top spool the film can be readily rewound after use, it being necessary, of course, temporarily to remove the spring belt. A bevel gear drives the shutter and the intermittent-motion mechanism through a horizontal spindle with a universal joint, the latter allowing for the vertical adjustment of the mechanism by a knurled wheel to vary the height of the 'gate' to suit the projector. A special type of metallic-filament lamp gives the necessary light, current being supplied by an 8-volt accumulator which lasts for 5 hours on one charge. Alternatively, an electrical resistance is provided for running the lamp off an ordinary supply circuit with any voltage between 100 and 250. The machine is well finished in stove black enamel, except the bright parts, which are nickel-plated.

BOOKS ON THE INSTALMENT PLAN.

Schemes for the supply of books on a system of easy payments have long been popular and very successful in America. Of recent years there have been rapid developments in the same direction in this country, and many of our readers will be glad to learn that the new edition of *Chambers's Encyclopædia* and the latest edition of *Chambers's Cyclopædia of English Literature* can now be obtained in this way. Four volumes of the *Encyclopædia* are already published, and these are supplied on a first payment of a few shillings. Volumes V. to X. will be forwarded as they are issued, and the payment for the entire work completed by a series of monthly remittances. The complete set of the *English Literature* is sent on similar conditions. Those interested should write to the Waverley Book Company, 96 Farringdon Street, London, E.C.4, for a prospectus; orders may be placed either through a bookseller or direct with the Waverley Book Company.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

FORESTALLED.

By E. R. PUNSHON, Author of *The Solitary House*, *Old Fighting Days*,
The Bittermeads Mystery, &c.

CHAPTER I.

WITH thunder on his brow and rage and fury in his heart, Big Tom Moore stood on the summit of the low hill he had just ascended, and watched where, in the distance, a faint trail of smoke stole timidly upwards against the far horizon, as if half afraid to sully the limpid purity of that clear northern sky.

To sight less keen than that of the hawk-like eyes of Big Tom Moore this thin line of smoke would scarcely have been visible from where he stood, but he saw it clearly, and knew well that it signified the utter ruin of all his hopes, the failure at the last moment of his great enterprise. For what else could that smoke mean save that in this valley where his fortune lay there were others before him?

He flung his pack on the ground; a bitter word burst from his lips; he lifted his right hand with a gesture full of rage and protest. 'It ain't fair,' he cried; 'it ain't no ways fair.'

For five long years of hardship and toil incredible he had sought this valley up and down the length and breadth of the wild north-west. Five years ago an extraordinary chance had put him in possession of information, almost of proof, that in it was hidden one of those pockets in which a store of gold of greater or smaller amount is heaped up by some freak of Nature. Long ago a pioneer had found traces, had tracked them to their source, and then had been prevented by illness and death from benefiting by his discovery. But the tale of his adventure had not died with him. Half believed, half scoffed at, for many are such stories that are told by the glowing stove in winter or round the camp-fire in summer, almost forgotten at last, it had still persisted till accident had placed fresh proofs of the truth of the tale in Big Tom Moore's possession. Then he had gone out to search; and after five years of toil and hardship such as few could have endured, he had at last found and identified the valley, and, as he believed, made sure of the exact spot where in all probability the pocket lay in the bed of an old water-course.

But when he made his discovery his stores were almost at an end; and supposing that a

secret Nature had guarded so long and so well would be safe for at least another three weeks, he had returned to the settlement for the supplies he needed.

There he had said nothing of his discovery, for he had no wish to bring a swarm of claim-hunters on his heels till he was sure of the exact position of the treasure. With some difficulty he succeeded in getting together the necessary outfit, chafing at every hour's delay and yet unable to let his impatience be seen lest suspicion be roused that he had made a 'strike.' But at last all was ready, and, storing his outfit in his canoe, he started alone up the river, taking many precautions to make sure he was not followed. Then, certain that no one had attempted to track him, he landed at the nearest point to his destination, hid his canoe under some bushes, made a cache of such of his stores as he could not carry, and making up the rest in a pack, started for his valley, full of sanguine expectations of the treasure that he felt so sure would soon be his.

And now all his hopes lay at his feet in ruins. For what else did that thin line of smoke tell him but that he had been forestalled? It was hard, it was bitter hard. He felt the blood drumming in his head; a passionate anger swelled within him, so that the veins of his temples stood out like knotted cords, and his great hands clutched convulsively in the air, as though closing on the throats of his forestallers. 'They'll have to git,' he muttered darkly. 'I'm not having any.'

Had he not searched for this treasure through long years of toil and hardship and disappointment? Had he not found it at last? Was it not his, this secret that Nature had guarded so many long years, and that surely he had been justified in supposing she could continue to guard for three weeks longer? Had he not a right to claim his own against these intruders, who at this very last moment were trying to thrust themselves between him and what was his?

'They'll have to git,' he muttered again.

Relieved at having come to a conclusion, he

went on with long, firm strides, a huge, dark ominous figure moving heavily through the clear sunshine that flooded all that lovely valley.

But the quiet beauty of the place, the grandeur of the surrounding hills in their clothing of pine and fir, the splendour of the far-off mountains, the loveliness of the quiet valley itself, that lay here in the heart of the hills like a perfect jewel hidden in an exquisite casket, were all alike lost on him. He gave them not a thought or a glance; he paid no heed to the stream that leaped so joyously at his side from rock to rock and pool to pool, nor yet to the little lovely flowers of the valley sward. Fiercely he strode on his way, his brow like thunder, his eyes two burning coals of fire, rage and resolution in his heart.

'They'll have to git,' he said. 'It's me or them for it.'

It would have been different, he told himself, if these intruders had already been in possession when he first found the valley. But that they should slip in like this, just when his back was turned for a day, was clearly intolerable. There was, of course, still the chance that the alarm might be a false one, and the smoke come from the camp of some passing Indian or from that of a stray hunter or trapper. But he knew well that this possibility did not in reality exist. This was not the time of year for trapping, and neither Indian nor hunter would be likely to have a fire going at this hour. No, it was a miner, a prospector, and the smoke came from a fire lighted to thaw out the gravel that even yet would be like iron with the winter's frost.

'And he'll have to git,' muttered Big Tom Moore through his teeth; 'that's all there's to it.'

And a little later he said aloud again, 'I ain't going to be done out of my rights.'

Straight on he tramped, aiming directly for the rising smoke that was much nearer now, and disdaining to turn aside for any obstacle. It seemed as though he took a savage pleasure in crushing down shrub and bush, as if he made a kind of symbol of refusing to allow any obstacle to turn him from his path.

Before long, for he had pushed on at a great speed, taking no more heed of the great pack on his shoulders than had it been a feather's weight, he came out on some rising ground almost exactly opposite the spot whence rose the smoke that he had seen from afar. Nor was he surprised to find that his suspicions were correct, and that these were certainly prospectors who had forestalled him, who had incredibly come to this valley that for so many years had lain silent and deserted, and that might well have remained so for three weeks longer.

They had even built themselves a rough

shack. Evidently their intention was to explore the place thoroughly. And they had actually started sinking their first shaft on almost the exact spot where he had intended to begin. It was too much, it was intolerable; they might have been spying on him—perhaps they had been. Anyhow, he was not going to put up with it. No! 'They'll have to git,' he muttered. 'So they will—them or me.'

He flung his pack down with a crash, and with long, firm strides pushed on towards the cabin. As he drew swiftly near the door opened and a man came out, a man nearly as tall as Big Tom Moore himself and quite as bigly built. He was older, though, for his thick dark beard was streaked with gray. But his great form seemed to have lost none of its natural power as he stood there in the doorway of his cabin, surveying with a slight surprise this stranger who in so remote and lonely a valley had made so sudden and unexpected an appearance.

'Hello, hello, Mr Man!' he called out loudly and rather boisterously. 'Where've you sprung from? Didn't know as there was a white man within fifty miles of here.'

Big Tom Moore took no notice. He came a little nearer, grim and resolute. He stopped and said, 'See here—you've got to git.'

CHAPTER II.

THE stranger first stared, and then began to laugh. 'Sure, you're crazed,' he said contemptuously.

'You've got to git,' repeated Big Tom Moore heavily; 'and mighty quick, too . . . see?'

'And for why?' the other asked, his laughter dying away, and his look now as grim and resolute as was that of Tom himself.

'Because I say so,' Big Tom answered; and then, with all his sense of injury and injustice breaking out, he cried angrily, 'I was here first—I was here three weeks ago—I only turned my back to get my stores up.'

'I don't know nothing about that,' answered the other doubtfully; 'that's all as it may be, and no concern of mine. I don't see your claim pegged out,' he added. 'Have you registered?'

'Huh,' said Tom, and repeated, 'I was here first, and you've got to git; that's all there's to it.'

'Nix,' retorted the stranger; 'this valley looks to me a real likely spot, and I guess you think so, too, or you wouldn't be so mighty keen on trying to scare me off. But that won't work worth a cent, and before I quit, I'll make sure whether there's any of the stuff hereabouts. Looks to me as if that creek hadn't always used to run where it does now, and I mean to have a try at finding its old bed; and if you don't

meddle with me, I won't meddle with you. Reckon we can both try our luck—the valley's big enough for both.'

'No,' said Tom, 'it ain't—not by a whole heap it ain't. You've got to quit. Only thing is, are you going quiet, or have I got to make you?'

The stranger looked at him thoughtfully. He was a big man himself, and he noted with a kind of unwilling approval the other's huge chest and shoulders, the swelling muscles of his arms, the grip of his firm feet upon the ground. Not without reason was his challenger known all through that country as Big Tom Moore; and as the stranger slowly removed his coat he remarked, 'Well, you must suit yourself if you want a fight. It ought to be a dandy fight, too—if we are let finish it,' he added with a slight air of anxiety, which at the moment Tom hardly noticed.

Tom took off his own coat and stood in shirt and trousers, as magnificent a figure of a man as the sun has ever shone upon or sculptor ever modelled. 'Ready?' he asked, and moved forward; and on a sudden, with a speed no one could have expected from so big a man, the stranger leaped within arm's length and dashed his clenched right hand full at Tom, catching him between the eyes with a blow so swift and terrible one would have thought no man could have lived against it, taken unawares like that. Even Tom, giant as he was, went reeling backward, dazed, shaken through and through, keeping himself upright more by good fortune than anything else. Indeed, had the stranger sprung, with that daunting speed he had already shown himself capable of, to follow up the advantage he had thus gained, he might well have ended the quarrel then and there, for, for the moment, Tom was in no condition to defend himself. Helplessly he rocked on his feet, exposed and defenceless, his hands hanging limp. But, instead of following up his advantage, the stranger stopped to laugh with sheer delight at the success of this swift blow of his that he believed to have been even more effective than was the case and to have won the fight before it had well begun—as indeed had happened with him more than once before. But this time it was not so, and while he stopped to laugh his triumph fled, his opportunity passed and was gone, for, indeed, laughter should come only when the struggle is over, not while it yet continues. The chance slipped by. Tom's momentary dizziness vanished; he shook his great head to throw off the effects of the blow, as a dog after a swim throws off the water from its coat, and once more he advanced, this time more warily.

'Heh?' the stranger exclaimed, astonished to see him coming back; 'you want some more, then?'

'More?' repeated Big Tom scornfully. 'Do

you think I count a tap like that?—not but that you brought it off pretty smart,' he added.

'I'll show you smart,' the stranger said, and leaped once more with that sudden, disconcerting swiftness of which he seemed to have the secret.

But this time with less success. For Tom was warned now and prepared; he guarded the blow the other aimed, and returned it with effect. Now they stood breast to breast, and like lightning they flung in swift hit and counter-hit till the whole valley rang with the sound of their blows and the tramping of their feet as the struggle swayed this way and that.

Backwards and forwards they went, their blows flashing to and fro, first one having the advantage and then the other, each in his turn giving and enduring hits beneath which lesser men would have crumpled up. Big Tom was bleeding from a split lip, a damaged ear; his adversary from a cut cheek and an eyebrow laid open to the bone. Tom's shirt was torn from neck to waist, and his skin beneath it, as smooth and white almost as a woman's, where sun and rain had not tanned it, was marked with more than one great livid bruise. His adversary, swarthier of skin, showed fewer signs of hurt, but just above his heart the skin was swollen and livid where again and again Tom's great fists had battered relentlessly. Half-unconsciously Tom's fighting instinct had made him shower most of his blows on that one spot, and a keen observer, had one been present, might have gathered from more than one sign that this policy was not without its results. Then one blow, heavier than most (though they were all heavy blows these two exchanged), that Tom sent smashing in, alighted on that same spot above the stranger's heart and sent him staggering backwards, so that, indeed, he must have fallen had he not kept his balance by reeling against the wall of the shack.

'Had enough?' grunted Big Tom, as for a moment the stranger stood there breathless.

For answer the other shouted aloud and ran in, received, but paid no heed to, a tremendous blow that took him full on the side of the head—it would have killed some men outright, but drew from him no more than a grunt—and seized Tom round the waist.

It was indeed a giant's grip that Tom felt thus laid upon him; it was a grip that might well have served to pluck up a young tree by the roots; it was a grip scarcely any other man could have endured. But Tom, with his feet firm upon the ground, withstood it as the mountain oak withstands the howling storms that strive to throw it down, withstood it still while its force seemed momentarily to increase, withstood it yet though his very bones seemed to crack and the idea came into his mind that he had more than the strength of mortal man who held him thus. Then, in his turn, with an

embrace as close and ardent as that in which a lover holds the mistress from whom he has been long separated, he clasped his own arms round his adversary and crushed him to him.

Thus silent, fierce, and deadly, tremendously they struggled, each tearing at the other with all the enormous strength that both of these great men possessed, till it was as though the very earth beneath them shook with the mighty efforts that they made.

But as yet the advantage was to neither; as the stranger had failed to overthrow Big Tom Moore, so Tom in his turn failed to uproot his opponent's feet from the ground on which they remained firmly planted. In vain Tom exerted every ounce of strength that he possessed; in vain his clasp about the other's body was such as the brown bear of the surrounding woods could scarce have equalled; in vain he called to his aid every last scrap of energy that nerve and muscle could provide. Like the gambler who puts the last coin of what was once a fortune on his last wager, so Tom flung every atom of his will and his strength into one final attempt to bear down his adversary, and now at last it began to seem to him that the other's almost superhuman resistance began to yield to his own surely more than human efforts. One last effort he made again, more fierce, more dreadful still than any that had gone before. But to meet it his opponent seemed to call upon some fresh reserve of strength that opened to his need, and then all at once it was as though

the energy of each man, exerted to the very limits of the possible, almost beyond them indeed, became simultaneously exhausted. Big Tom's grip upon his opponent slackened; his opponent's resistance slackened also, and he stumbled, tripped upon a little stone, and fell. With him fell Tom also, unable to help himself, and for a moment or two they lay side by side, like the dead, scarce breathing, powerless to move hand or foot, helpless now, both of them, to resist even a little child.

But Tom was, after all, the younger man, and by virtue of his youth it was to him that strength first began to return. He lifted himself slowly, he raised himself to his hands and knees, and glared at his opponent, and saw him glaring back at him with undiminished ferocity.

'Had—'nuff?' Tom panted.

'Nix,' muttered the other; 'I—I'll whip you—yet.'

He tried to get to his feet, and failed. Tom, more successful, succeeded in getting himself upright, but then his legs gave way under him, and he sank down on his knees. Two pitiable enough objects they looked, spattered with blood from head to foot, bruised, their clothing torn, panting, breathless, glaring at each other with a kind of dazed ferocity. And then, all at once, between them stood another form, that neither of them had seen approach, and a clear voice asked, with anger and disgust, 'What—ever—have—you been doing?'

(Continued on page 372.)

THE LORD ADVOCATE.

I.

WHEN the people of Scotland consented that their parliament should, with that of England, be merged in a new parliament of Great Britain, they were determined not to lose their identity as a nation. In particular, they were resolved to retain their ancient laws and their separate judicial system, and these remain to this day, in their substance unchanged. It is, however, in the practical administration of the law more than in the law itself that one notes the difference between the two systems that confront one another across the Tweed. In Scotland, for instance, there are no coroners' inquests, a private prosecutor is seldom seen, and there is no *Habeas Corpus* Act—whereas all these are regarded in England as essential to the safety of the subject.

The explanation is a simple one, namely, the existence of a personage who has no counterpart in England, and is generally known as the Lord Advocate. In civil matters he also appears from time to time. If the Crown claims salmon-fishings, it is the Lord Advocate who sues. If

somebody has received evil treatment from a Secretary of State, he need not present a petition of right as in England—he simply sues the Lord Advocate. That great officer of state, as he was before the Union and remains to this day, was not, however, the invention of some far-seeing early king. The office has grown and developed through the centuries, and the powers and responsibilities of its holder have varied from time to time.

From the beginning of law courts there have everywhere been pleaders and advisers skilled in the law to which the parties were appealing, and in eliciting—or obscuring—the true facts of the case, and, as a rule, receiving some tangible appreciation of their services. In Scottish records they appear under various names—prolocutor, procurator, advocate, which last, possibly from association with France, came finally to be preferred. The king, no doubt, had from time to time to employ some advocate, for he could both sue and be sued in his own courts; and Sir John Ramorny, who figures in *The Fair Maid of Perth*, is described in the 'Scotichronicon' as '*in arduis causis prolocutor regis*.'

But, so imperfect are the national records, it is not till the time of James III. that an official termed the King's Advocate appears in the person of Sir John Ross, of Mountgrennan. He was succeeded by James Henryson, who, in 1498, received from the king a life pension of £40, which seems to have become standardised as the official salary. And from that time the successive holders of the office are all known.

In the south end of the old Parliament Hall in Edinburgh there is a window of coloured glass, made, unfortunately, at a time when it was believed that such work could be done better in Munich than at home. It represents King James V. in state, with his mother, Margaret Tudor, on another throne near by, presiding over the first sitting of the Court of Session, in the Collegiate Church of St Giles, on 27th May 1532. Gavin Dunbar, Archbishop of Glasgow and Chancellor of the realm, is standing in front of the king. Kneeling beside him, Alexander Miln, Abbot of Cambuskenneth, is reading aloud the oath of office, which is being taken with uplifted hand by the Justice Clerk, behind whom is standing Adam Otterburn, the King's Advocate. The scene is, of course, due to the imagination of the artist, who knew no better than to represent the archbishop as holding a bishop's pastoral staff; but that something of the kind happened is plain from the official narrative of proceedings still extant in the Register House.

Up to this time the administration of justice had been in a confused condition. In England the King's Courts had very early absorbed practically the whole litigation of the country; but in Scotland the local courts of Barons and Lords of Regality still held their ground, while the Supreme Court itself had passed through various phases. The reform bears to have been proposed by the king himself, now twenty years of age, but its true author was probably the Chancellor, who had been his preceptor when a boy. The scheme was to set up 'ane College of cunning and wise men, baith of spirituale and temporale estate, for the doing and administracioun of justice in all civile actiouns,' and included the establishment of the Court of Session. It was welcomed by parliament and embodied in an act, which also gave, in advance, the force of statute to such detailed 'rewlis and statutis as sall pleise the Kinge's grace to mak.' These were drawn up by the Chancellor, the President, and other Lords of Session, 'to be obseruit and keptit be the said Lordis of Sessioun, Advocatis, and procuratouris of the samyne, and be all clerkis, scribis, maseris, and other ministeris of court in all tymys cummyne.' With the king's signature at the bottom of each folio they are carefully preserved in the Register House, and they also appear in fac-simile in vol. iii. of the *National Manuscripts of Scotland*.

II.

Of these regulations there are several which have a special bearing on the present subject. To secure the proper conduct of litigation it is provided that the only persons to be heard are the parties, or their procurators, if they so prefer; that certain existing procurators of repute, who are named, shall be admitted to plead in all actions, along with such suitable persons as from time to time the Lords shall admit to 'the office of advocatioun and procuratioun,' they in turn being bound to 'procure for every man for thair waigis,' unless they have some reasonable excuse, and sworn faithfully and diligently to exercise their office; and, finally, that no one shall stand inside the bar to plead except the King's Advocate.

From the beginning it was thus contemplated that, saving the right of every man to be heard in his own cause, no one should appear to plead before the Court of Session except such persons as after trial the lords might see fit to admit to the office of advocate; and it was also made plain that the advocates thus admitted had duties to the lieges and to the Court, as well as the right of audience. It was natural that a formal association of these selected persons should come about, with its own bylaws and its own head, known, to the puzzlement of strangers, as the Dean of Faculty. But the association was a voluntary one, and to this day has continued without any act or charter of incorporation.

The Court has all along done its best to secure a high standard of legal attainment and professional honour amongst those admitted to the office of advocate. A great lawyer is born, not made. But no man, whatever his intellectual gifts, can be a safe adviser, an effective counsel, or a sound judge, without a knowledge of the law which he has to apply. And that knowledge must not be merely a surface knowledge of statutes, text-books, and decisions. It must go deeper down towards the roots of things, so that the mind becomes possessed of the principles on which the law is based. Such a training is obviously very different from what is required for the equipment of a solicitor, whose work follows different lines. And such a training it has always been the aim of the Court to secure. In the sixteenth and seventeenth centuries the great schools of law were in foreign lands—at Bourges and Toulouse, Leyden and Utrecht—and old petitions for admission to the office of advocate often set forth how the petitioners have been there. One in particular may be referred to. On 18th January 1659 a supplication was received from Mr George Mackenzie, student of law, making mention that 'he has these six years past been endeavouring to qualify himself for the office of an advocate, both by studying the Civil Law

abroad in the universities of France and Holland, and the Municipal Lawes at home.' It was thus not only from his native genius that in the vision of Steenie Steenson 'the bluidy Advocate Mackenyie, for his worldly wit and wisdom, was to the rest as a god.'*

The Court has for long utilised the Faculty to regulate the studies and test the acquirements of applicants for admission. From time to time the conditions have varied, and they will probably continue to change in order to carry out the purpose for which alone they exist. But it is still to the Lords of Council and Session that the aspirant presents his petition, and it is by their lordships alone, in virtue of the 'rewlis and statutis' of James V., that he is admitted to the office of an advocate.

III.

In the new hierarchy set up in 1532, the position of the King's Advocate is plainly recognised. Strangely enough to modern ideas, the actual holder of the office was also one of the original judges appointed by the act, and this conjunction of offices was not uncommon down to 1677. But even when not a judge, the King's Advocate was apparently made free of the consultations of the Court. In 1538 Maister Henry Lauder of St Germaines, who had succeeded Otterburn, tendered to the Lords a letter from the king directing that he should be allowed to attend their deliberations 'sua that he may heir and know sik thingis as sall happen to occur that concernis us.' But this qualification very properly follows: 'Exceptand always the occasionnis and causis for the quhilkis he beis advocat and speikis for at the bar allenarly.' And this was no dead letter, for in 1546, in a case 'persenit be him and at his instance as Advocate,' the Court found 'that the Advocate should ryse and pass to the bar and nocht vote thereon.' The Advocate was the same Henry Lauder, who had been made a Lord of Session in 1540.

This recognition, however, applied to the Advocate only as a counsel, and that solely in civil causes, with which alone the Court of Session was concerned. It had no reference to criminal matters or to administration of any kind. And even in civil affairs a special warrant under the royal sign-manual was necessary when the Advocate desired to raise an action in his own name as pursuer for his Majesty's interest. It was not till 1857, it may be noted, that this unnecessary formality was finally swept away, and his Majesty's Advocate made the proper pursuer and defender in all public suits. In the parliament of 1540, Mr Henricus Lauder, already

mentioned, appears as an *ex officio* member along with the other officers of state, and in his official character took part in the proceedings. Before long the next step was taken. The administration of public affairs at this time was in the hands of the Privy or Secret Council, and early in the reign of Queen Mary, Arran being regent, it was decided that 'my Lordis Thesaurar, Secretar, Comptroller and Clerk of Consell, and Justice Clerk and Advocatt of Consell be and remane continualie thairupoun.'

The King's Advocate had thus become more than the king's legal adviser and procurator in civil causes—he was a legislator, and associated with the general administration of the realm. In the sphere of criminal law he, however, had still no special place.

In the reign of James III. the King's Advocate no doubt appeared in treason cases before parliament, but that was only on behalf of the king, who in such proceedings was the true prosecutor. In ordinary crimes the prosecutor was the injured party or his representatives, appearing sometimes in person, sometimes by counsel, while occasionally the Advocate also appeared on behalf of the king, who was interested in possible fines and forfeitures. The results of such a system were not satisfactory. Private malice might press a charge unfairly against the accused—as in the infamous prosecution of Lady Glamis—while private cupidity might sacrifice the claims of public justice, and, on terms, allow an opulent malefactor to escape. Further, there might be no prosecution—even in cases of manslaughter, for it was common for the slayer to pay compensation to the dead man's kin, who in return granted what was known as a Letter of Slains, discharging their claims and agreeing to a remission being asked from the king. Forms both of the Letters of Slains and of the king's remission appear in a collection of styles compiled, after the Restoration, by George Dallas of St Martins.

IV.

Various attempts at improvement culminated in an act passed in 1587, which provided that 'the Thesaurer and Advocate persew slaughteris and utheris crimes, although the parties be silent or wald utherwayes privily agree.' The conjunction of the Treasurer with the Advocate was due, of course, to the king's interest in fines and escheats. But the basis of the change was the recognition of the fact that a wrong done to an individual, when criminal, is also an offence against the public well-being, and accordingly a crime against the state. This act, though it set on foot the system which still exists, did not abolish the private prosecutor. For long the normal practice has been for his Majesty's Advocate to prosecute. If he refuses to do so, any private person who alleges that a crime has been committed which is also a wrong against

* The Keeper of the Advocates' Library has recently pointed out that these words do not appear in the MS. of *Redgauntlet* presented to the Faculty by the present Lord Advocate, and must have been added by Sir Walter in proof.

himself may ask the concurrence of the Lord Advocate in a prosecution at his own instance. And if that concurrence be refused, he may apply for a remedy to the Court of Justiciary. As recently as 1909 such an application was made, and the Court being dissatisfied with the Lord Advocate's explanation, allowed the prosecution to go on without his concurrence, and a conviction was obtained.

Still more recently, when the crime alleged was not a wrong done to an individual but fraud on a government department, and the Advocate refused to prosecute, his conduct was assailed in the House of Commons, where he had to justify his refusal. In this case a civil action for damages was ultimately raised by the department concerned, and much public money wasted without result. These two modern illustrations show exactly the position. Through his subordinates—procurators-fiscal in particular—all criminal matters come before the Lord Advocate, not as a law officer advising the Crown, but as himself the master of the situation, though for his official conduct he may have to answer with his official life. There is thus a very wholesome check on any failure on the part of the Lord Advocate to do his duty, to whatever the failure may be due; while at the same time the possibility of vindictive or malicious prosecutions is practically excluded. So well has the system worked for centuries that proposals to introduce coroners' inquests, true bills by grand juries, and the like, are never heard of, especially as the Lord Advocate can always order a public inquiry into any sudden or suspicious death when he may think that expedient.

After the Union the affairs of Scotland were managed for a time by a special Secretary of State. That office ceased to exist in 1746, and from that time onward the conduct of Scottish business very often devolved on the Lord Advocate, though the Home Secretary was in law the responsible official. Much of course depended on the respective personalities of the Advocate and the Secretary, and, as is well known, Henry Dundas, who was Lord Advocate from 1775 to 1783, was during these years practically the uncrowned king of Scotland. In 1885, however, the institution of the present office of Secretary for Scotland relieved the Advocate of much of that class of work, and restored him to what may be regarded as his true historic position.

During its long history the tenure of the office has varied. Especially at the beginning there are several instances of joint Advocates. The inconveniences of this arrangement are noted in the commission of Sir Thomas Hamilton in 1587, but it did not end till Sir Thomas Hope became sole Advocate in 1628. There are also various instances of the office being granted for life, but as a rule the tenure was what it

has long been, namely, during the king's pleasure.

One curious episode deserves notice in this connection, especially as it seems to have been seriously misunderstood. Sir George Mackenzie was dismissed from office in May 1686. Some difficulty was found in filling his place, and Sir George Lockhart, the Lord President, it has been said, was directed by the king to act as Lord Advocate. It is difficult to understand how the Lord President could discharge the various duties of the Lord Advocate as these have been set out above. But the explanation is very simple. No such direction was ever given to the Lord President. The incident is thus recorded by Lauder of Fountainhall: 'At Secret Council there is a letter from the King, ordering Sir George Lockhart, President, to officiate as Advocate in this Parliament, that the royal prerogative suffer no diminution.' As a great officer of state the Advocate had a seat in parliament and certain duties to discharge there, and the king's order is, on the face of it, limited to the performance of that special function.

When reorganising the finances of the country in 1595 the committee generally known as the Octavians succeeded temporarily in getting the appointment of the Advocate into their own hands. And a little later Charles I. was deprived of the appointment of all the officers of state, including the Advocate. But in 1661 the king's rights were restored.

Since the modern party system sprang up, the office of Lord Advocate has usually been held by a member of the political party in power, and the king's pleasure has resulted in the Advocate going out of office with the government of the day.

CALL OF THE HILLS.

WE seek the foot of the rainbow
For fairy hoard of gold,
Or follow a dream's pale shadow
Till hope droops wan and old;
But high o'er Cotswold hills and downs
The winds blow clean and free,
And white roads climb from far-off towns
To all eternity!

Way down in the noisy city
Life's battle rages fierce,
And the victors know no pity
For broken hearts they pierce;
O'er fields of God's own west countrie
The clouds float softly by,
While larks trill out right merrily
The joys of earth and sky.

Ah, leave the sordid toil and strife,
Nor heed the old world's goal!
We'll seek the treasure-trove of life—
Pure hearts and strength of soul.
Where Cotswold beech and larch and pine
O'erhang the gray stone wall,
There's home, there's love for me and mine,
And rest, when shadows fall.

V. R. J.

THE SNAPDRAGON AND THE HUMBLE-BEE.

By W. F. CHARLES, F.R.M.S.

I.

MOST of us who have access to a flower-garden have, at one time or another, amused ourselves by nipping between the finger and thumb the neck of the flower of the snapdragon, thus causing the mouth-like formation of its corolla to open as pressure is applied, and to close with a snap when the pressure is released. This grotesque performance, which is operated by means of a series of spring coils within the mechanism of the flower, may have induced our somewhat superstitious forebears to confer on the flower the appellation of snapdragon. The flower itself, however, had quite another purpose in view when, during a long course of evolution, it proceeded to fashion its present form of corolla. The spring coil and various other ingenious devices which I shall presently describe are connected with the fertilisation of the flower, and are in operation for the purpose of facilitating the admission of certain privileged insects to the nectar stores secreted by the flower by way of reward for services rendered, or in order to keep away other honey-loving intruders, who would rifle these stores without performing any act of service in return.

Plants hold very different opinions as to the manner in which the fertilisation of their flowers should be effected. Quite a number produce the male and female elements in the same flower. These elements ripen at the same period, and fertilisation is effected. Self-fertilisation is probably false economy, and is generally regarded as a retrograde movement, as the offspring of such plants suffer the disadvantage of the loss of inherited instincts gained when cross-fertilisation is the method of reproduction; and as a consequence, self-fertilised plants become less able to compete in the race for existence. Cross-fertilisation plants differ also somewhat in their methods. Some plants, for instance, produce the female element on one plant and the male element on another; others produce the male and female flowers on the same plant; but the vast majority of flowers contain both elements, and effectually prevent self-fertilisation by causing one element, usually the stamens, to reach maturity before the other element, the stigmas.

Seeing that plants have a fixed position and cannot approach each other, some device must be adopted whereby the pollen of one flower may be carried to the stigma or (where there are more than one) stigmas of another. One group of plants, the Graminaceæ, which includes the grasses and the corn-producing tribe, relies on

air-currents to carry the pollen of one plant to the stigmas of another. In this case the flower is inconspicuous and produces no showy petals, the stigmas merely hanging out to receive the pollen which comes into proximity when carried about by the wind. This plan of wind-fertilised plants is successful in effect, but wasteful in operation; for it to be effective, the air must be laden with pollen, the bulk of which is wasted. (Incidentally, those humans who suffer from hay-fever ardently wish that the Graminaceæ would keep their pollen at home.)

The other members of the cross-fertilisation group employ insects to carry their pollen from flower to flower of the same species; and to repay and attract their insect friends, they produce honey which serves as a reward for their trouble and assistance. Some flowers do not seem to be very particular as to the insect which shall perform this service for them; such flowers have usually very open corollas and a large number of stamens, and consequently produce a proportionate quantity of pollen. Doubtless a considerable quantity of this pollen is lost by insects which do not travel consecutively from flower to flower of the same kind, and therefore do not effect fertilisation by the pollen carried away. On the other hand, various plants have so far developed themselves as to select a particular species of insect to assist them in the process of cross-fertilisation, and these plants usually modulate their flowers and secrete their honey in such a way, or adopt such a contrivance, that the honey is to be obtained by their accredited agents only. They also usually design some device either for punishing marauding intruders or for deterring them from entering their corollas in quest of honey. One of the plants which has developed along these lines is the snapdragon. Its methods of preventing theft, however, are on the deterrent side, so it is not so ferocious as its name implies. With this information we are now in a position to examine the snapdragon flower, and solve the problem of its curious structure.

II.

Long ago, before the flower assumed, in its entirety, its present shape, its leanings were undoubtedly in favour of establishing business relations with the humble-bee family, and of devising methods by which the humble-bee tribe alone could enter and partake of the honey provided by the flower for its guests. If we look carefully at the front of the flower, we find that the portion which forms the upper jaw is composed of two petals, united almost entirely together, the apices of which curl back, remind-

ing one of a cock's comb. The lower jaw is composed of three petals, also united together, except at the apices, where the three lobes, or portions not united, project downward, forming a structure something like a beard. This beard-like formation constitutes a platform which the flower has arranged for the visiting bee to settle upon. Having settled, the visitor proceeds to lever open the flower with its head and shoulders by overcoming the tension of the spring coils previously referred to. This is no easy task, and requires the force of a powerful insect to perform it. It has been ascertained, by actual experiment, that the force necessary to lever down the lower jaw is equal to forty grains in weight. The orange-striped humble-bee usually weighs about eight grains, so to open the flower a force equal to five times the weight of the bee is necessary, which is rather a formidable exertion. An orange-striped bee continually opening snapdragon flowers sooner or later shows marked signs of exhaustion. Having obtained admission, the bee creeps towards the throat of the flower, and pushes its long proboscis down a protected passage to the honey stores, which are concealed in the throat of the flower. Whilst the bee is busy abstracting honey, the stamens of the flower are also busy daubing its shoulders with pollen. This is carried away by the bee, and ultimately inoculates the stigmas of older flowers sufficiently ripe to receive it. The stamens, it will be observed, spring from insertions at the base of the corolla, and are prolonged to an arched recess in the roof of the upper jaw. There are four in all, two longer and two shorter ones, and there is seen between these two rows the stigma, supported on a long thread-like process called the 'style,' which springs from the top of the seed-vessel situated at the base of the flower. When the stamens have shed all their pollen they shrivel up, after which the stigma becomes sticky and ripe for fertilisation, which is effected by a second visit from a bee, fresh from a pollinating flower.

The advantage of this mutual arrangement between the snapdragon and the humble-bee tribe is that the flower, sure of its visitor and the effectiveness of the visit, needs only four anthers to produce the requisite quantity of pollen, since the waste is reduced to a minimum, and pollen production is of an exhaustive character.

III.

We have now arrived at an interesting, if somewhat theoretical, stage of our story, and the following questions may flash across our minds. Does the accredited bee during its wandering flight accidentally stumble across the flowers awaiting its visit, or is it guided to them by some mysterious agency? Is any indication given to the bee where honey is

obtainable, or are the individual flowers visited in a haphazard and indiscriminate manner? There is strong evidence to support the theory that the bee, even at some considerable distance away, is guided to the flower, and that the visits to individual flowers are not haphazard, but that the bee is made aware of the presence or absence of honey in any particular flower. Therefore the flowers visited are selected. When the flower is ready for the visitor, it advertises the fact by means of its perfume and its colour; the perfume indicates the direction in which the flowers are to be found, whilst the colour locates the spot. It may be urged, however, that the flowers of the snapdragon, like showy flowers of many other species, are devoid of fragrance. Quite so, so far as we are concerned; but our ability to smell, like our perceptions of colour and sound, is limited to our necessities, and because we are unable to detect a perfume in an apparently odourless flower, it may be that this is due to our restricted faculties, whereas the bee, with its finer susceptibilities, is not so handicapped. Indeed, I would go so far as to suggest that every coloured flower has its distinguishing perfume, and I will endeavour to support this theory, partly by comparison with the kindred senses of vision and hearing, and partly by facts proved by experiment.

Colour is made manifest to us by light-waves of varying lengths, but we know there are rays consisting of such short wave-lengths, and others of such long wave-lengths, that they are beyond our range of sensibility. We are sensible only to those rays the wave-lengths of which lie between these two extremes. The case of sound is analogous. Suppose the keyboard of a piano were extended at either end, we should at length reach points at which the vibrations at the one end would give rise to waves of such low frequency, and at the opposite end waves of such high frequency, that the sounds emitted would be inaudible to our ears. For a long time it has been considered that our recognition of odour is due to actual particles which enter the nostrils. This theory I regard as being unpractical and obsolete, and I believe our sense of smell is entirely due to our reception of odoriferous waves, which, when they reach us, are translated into the sense of smell. Further, it is a fact proved by experiment that when bees are captured over-night upon some particular species of flower from which they are abstracting honey and taken some distance away, quite out of sight of the flowers, on being liberated the following morning they fly back in a straight line either to the same flowers or to the same species on another plant, proving decisively that they are led there by their sense of smell, even when the flowers are inodorous to us.

The principle in flowers which gives rise to the formation of perfume is known as essential oil, which is secreted by the flower, and is volatile.

During the vaporisation of essential oil electrical disturbance is set up within the corolla of the flower, giving rise to the formation of ozone, a very chemically active form of oxygen. This ozone oxidises the essential oil, and the chemical energy thus brought into play sets up waves of odour of varying frequencies, which, to the sense of smell, is translated as perfume. These emanations of essential oil probably occur only conjointly with the secretion of honey, and at the time the flower is in need of the services of its visitor; thus we are able to see why a bee hovers over a number of flowers, and is able to pick out those which will repay its attention. But much of the essential oil produced and vaporised is passed into the atmosphere. This, travelling along, is oxidised at various points, at which are set up odoriferous waves, and in this way a wireless communication is established between the flower and the passing bee. This theory, I think, also explains why the perfumes of flowers become more intense after a thunderstorm: the atmosphere is then more than normally excited electrically, and, owing to the increased presence of ozone, the essential oil is oxidised nearer its base, so that the perfume is, as it were, concentrated within a very short distance of the flower.

IV.

If we return to the devices adopted by the snapdragon to keep out uninvited guests, the upper jaw of the flower, it will be observed, has a flange, and on the outside of this flange a groove. The lower jaw has a corresponding flange, which fits into the groove of the upper jaw, and so almost entirely closes the flower against marauding visitors, such as ants and other honey-loving insects. Round the inside margin of the lower jaw is a ring of matted hairy growths, which are undoubtedly there for the purpose of entangling the feet of insects which have penetrated the interior by stealth. Looking farther into the flower, we find along the palate two lines of hairy growths extending in a parallel direction towards the throat. Each of these hairs is surmounted by a swollen portion or capitate cell, barely visible to the naked eye, but readily seen if looked at through a pocket lens. Examined under fairly high magnification with a microscope, these cells are seen to be filled with a viscous fluid, and their surfaces are dotted over with rows of prominences or papillæ. The structure of these papillæ at the summit is very thin, and easily ruptured, allowing the sticky contents to escape. The use of capitate hairs on plants has been variously explained, but in this instance they are evidently there to defeat the object of marauding insects, particularly ants, the rupture of the cell and the oozing out of its sticky contents bringing about the discomfiture and defeat of the aggressor.

Looking still farther down the mouth of the

flower into what we may describe as the throat, we find encircling the base of the stamens, and effectually blocking up the passage to the cup-shaped nectar reservoir, almost immediately below, a dense mass of pear-shaped capitate hairs, with their apices pointing upwards. These are not constructed to be ruptured; but they prevent any robber insect from approaching this reservoir, though the humble-bee, for whom the nectar is reserved, readily obtains it by thrusting her long proboscis through this mass of hairy obstacles. The method of rupture of the papillæ-covered capitate hairs by ants—and it is against ants this device is directed—is most interesting, and has not, to my knowledge, been previously explained. It is brought about in the following manner. Many plants cover their surface, especially their flower-stalks, with dense masses of hairs, the object being to prevent ants from obtaining access to the flower; but as in other walks of life these offensive and defensive tactics resolve themselves into a competition, as between the safe maker and the safe breaker. Between the ordinary claws of the ant's foot is a small membranous organ, the purpose of which is to enable the insect to climb a slippery surface. This organ, called a pulvillus or cushion, is not peculiar to the ant. All insects, such as flies and bees, which are able to crawl up and down slippery surfaces like a window-pane are endowed with a pulvillus; but the ant, or at least the garden ant, has further perfected this climbing organ, and has developed within the pulvillus of each foot a pair of exceedingly minute claws, bowed like a pair of forceps, and with very sharp points, compared with which the most sharply-pointed needle is flat and blunt. With this instrument—the points of which the insect can readily thrust amongst the dense mass of hairs—and by grasping the hairs, it is able to pull its body along such hairy surfaces. At the same time, however, the papillæ of the capitate hairs in the corolla of the snapdragon are so easily ruptured that the flower has evidently prepared a trap for the insect's undoing. The snapdragon, however, is more merciful than some of its contemporaries, the robbing propensities of the insect being merely checked by nothing worse than wet sticky feet, which the ant abhors. Professor Kerner, the celebrated Austrian botanist, has called attention to certain delicate cells fringing the flowers of some species of lettuce, which when ants pass over them in quest of nectar are ruptured; a milky fluid exudes, and rapidly coagulates round the victim's feet, ensuring a slow and torturous death.

V.

Let us return now to the mechanism which causes the lower jaw to close with a snap after being pressed down. If very thin sections be

made of this structure longitudinally and examined under the microscope, two lines of parallel coils of vegetable fibre are revealed. These, in conjunction with the natural elasticity of the surrounding tissues, enable these fibre coils to expand and spring back exactly in the same way as elastic wire coils are used to pull back an open door; but in the case of the snapdragon the tension must be so finely balanced that it must be sufficiently strong to resist the attempts of other honey-gathering insects, such as the hive-bee, but not too strong for the strength of the humble-bee. If the tension varied either way, the fertilisation of the flower would become abortive, and the plant then would soon cease to exist. But it may be suggested that an insect not so powerful as the humble-bee might upset this spring-coil device by pushing the upper portion of the

corolla sideways from the lower portion, and in this way gain admittance. If, however, we look at the flower frontwards we at once notice that this possibility has been provided against by a small V-shaped notch in the lower jaw and a corresponding projection which accurately fits into it on the upper jaw, thus forming a tongue and groove arrangement, which, in union with the spring coils, acts as a bolt, and effectually prevents the flower from being entered by side pressure.

Clearly the spring coil and the tongue and groove arrangement are devices in which the human inventor was long ago anticipated by the snapdragon flower. In fact it is said with a considerable amount of truth that scarcely a human mechanical invention exists which has not its counterpart in the structure of the plant edifice.

A GIPSY OF THE NORTH.

By OTTWELL BINNS, Author of *A Mating in the Wilds*, *A Hazard of the Snows*, *Clancy of the Mounted Police*, &c.

CHAPTER XVI.—continued.

CARWYKE hurried towards the house, passing two small groups of natives watching their fellows struggling in the packed doorway. No one interfered with him, and he had almost reached the doorway, when he saw the swaying, reeling figure of Mardock moving towards him, plainly with no knowledge of what had happened. He shouted to him.

'The house! The house, for your life.'

The reeling Mardock turned, stumbled, and then fell prone, but a moment later was crawling on hands and knees towards the doorway. Eskimo Billy, running in the wake of Carwyke, saw him, and remembering that at the moment of their meeting he had been trying to break open the door of Carwyke's prison, stopped to help him. Then, as he lifted Mardock to his feet, a pistol cracked behind them, and Billy fell himself. Carwyke heard the shot, and looking over his shoulder saw his comrade on the ground, with Mardock swaying by his side, and Standifer with a still smoking pistol in his hand. Tortured by apprehension he hurried into the house, set Norma down, and ran out to help Billy. As he emerged Standifer's pistol cracked again, and he heard the bullet whistle by him; but taking no notice of the fellow, he kept on, and picking up the fallen man, reached the house unscathed. In the doorway he turned and looked back. Mardock had risen to his feet again and was stumbling forward, whilst Standifer was making for the woods, though as yet the Indians, making no hostile move, were congregated about the entrance to the church, seething with excitement. Then, even whilst

he was looking, Standifer turned and raised his hand. The pistol cracked, and the reeling man fell prone and lay still. That he was dead Carwyke never really questioned; and after watching him a moment he backed into the house, and setting Billy down, hastily barred the door with a stout wooden bar which was plainly designed to hold it from outside assault.

That done, he looked first at the unconscious girl, and then at Billy. The latter opened his eyes at the moment and spoke. 'We got ther Missy!'

'Yes, but things are pretty bad. We're fairly trapped here, and can't get out unless the natives are willing. Where are you hurt?'

'Foot this time. Smashed, I guess. An' I got one in the shoulder up the river, but thet ain't of much account, though it knocked me silly at ther time. Better look after Missy, an'—'

'No! you first; Norma has fainted, I think—nothing worse. I'll take a look at your foot whilst these Indians are making up their minds what to do with us.'

The wounded man laughed weakly. 'Foot don't matter thet much if them beggars outside mean business. I reckon Missy an' yo' had better run for it.'

'No! Norma would never forgive me if—'

'Don't matter about me. I got ther priest, an' I've bin wantin' him for years. Yo'd best try an' get Missy clear out of this.'

'No use trying at present, I fancy. Listen to that,' he added, as a mournful wail broke

out, a long quivering cry that seemed to fill the world with sorrow.

'Yep! Thet's a woman. Keenin' for thet beggar Arloff! I'm glad. Thet means he's as dead as a bullet can make a man, I guess.'

'O-o-o-o-haa-ha-a-ha-aa-a-a-o——'

Carwyke listened for a moment to the woman's wail, which now was taken up by other voices, and a look of trouble came on his face. If the Indians so venerated their priestly tyrant as to mourn for him in this fashion there was little hope of ultimate escape for Norma and himself, whatever might happen to the wounded man.

'But——' he began, and broke off sharply to listen. The wailing had suddenly stopped. Instead of the rising and falling note that expressed infinite sorrow, there sounded the harsh voice of a man speaking rapidly and with vigour.

'Somethin' up!' said Billy. 'Maybe thet beggar ain't dead after all.'

'That is possible,' replied Carwyke. 'Indian women will keep up their keening for the dead for days. I've heard them. I wonder what's really happening?'

'Better take a look,' suggested the ex-whaler.

Carwyke considered a moment, then, moving towards the door, listened carefully. There was no sound of movement on the farther side; no sound at all except that of the guttural voice that was raised in harangue. Cautiously he slid the bar from its sockets; then, lifting the latch, opened the door an inch or two and looked forth.

The first thing he saw was Mardock lying in the foreground in exactly the position in which he had fallen, and beyond, close to the wooden wall of the church, bunched close together were the men, women, and children of the tribe, whilst in front of them stood two figures—one that of an aged Indian, the other a young man dressed in the fantastic garb affected by Alaskan shamans. The medicine-man was the speaker, and his eloquence rang sonorously in the silence. At that moment Carwyke would have given five years of his life for knowledge of the dialect in which the man was speaking, for it was clear to him that the fate of Norma and Billy and himself lay in the hands of this young orator. Absorbed, he watched the scene; and then Billy's voice broke out, 'What's up?'

'I can't tell. There's a fellow with horns on his head making a speech and——'

He broke off as the oration ceased suddenly, and then a shout went up from the assembled natives. A moment later the shaman turned his back upon the crowd and began to walk slowly towards the house, his hands raised in sign of peace.

'There's something going to happen, Billy. The medicine-man is coming this way.'

'Better pot ther beggar,' said the wounded

man. 'Shamans up here are sorta Mother Carey's chickens. There's trouble brewing.'

'I'm not so sure. The fellow's alone, and he seems friendly disposed; has his hands lifted.'

'Knife in ther parm of one ready for throw-ing, I'll bet. Beggar ain't to be trusted.'

'I don't know,' said the other doubtfully. 'There's no weapon visible about him.'

'Then hand me ther rifle, an' let ther beggar in. Reckon he'll do very well for a hostage, an' if there's any slimness——'

Carwyke ran back from the door and thrust the rifle into his friend's hands. That done, he hurried to the door anew. The shaman was now very near, and as Carwyke opened the door he halted. With the spreading ox-horns on his head, his other odd accoutrements and his painted face, he was a strange and rather fearsome figure, but that his disposition was friendly there could be no doubt; and as Carwyke lifted his own hands the native spoke in guttural English. 'Is it peace, white man?'

'Peace!' answered Carwyke.

At that the shaman dropped his hands and advanced. Carwyke stood aside and the Indian entered the house, to find himself covered by Billy's rifle.

'We got ther beggar! Shut ther door, Mista Carwyke.'

For one second the shaman's painted face revealed that he thought he was to be treacherously dealt with; and in that second Carwyke spoke. 'Put down that gun, Billy. We play the game fairly.'

'But, Mista——'

'Put it down, fool!' interrupted the other harshly. 'The man is our friend.'

'That be truth,' said the shaman, a flicker of friendliness in his dark eyes, as, turning from Billy, he looked straight at Carwyke. 'I came to say you may go, O white men.'

'Go?'

'Yes! The canoe will be brought to the landing. The stores will be carried down, and you and the white Klootchman, whom the friend of Arloff would have married, may depart. I have brought the people to that mind.'

The man's English was broken and disjointed, and the tenor only of it is given; but there was authority in his voice and bearing, and something about him carried conviction even to the mind of the suspicious Billy, who asked suddenly, 'We may take ther guns?'

'A rifle here is worth many skins. Two only may be taken.'

'Two's enough, I reckon,' grunted Billy, looking at the man wonderingly.

'You have arranged this?' asked Carwyke. 'Why?'

'I have been south to the salt waters. I have seen many white men, and I was their friend, for they were good men; and when the

snow was deep and the dogs were dead, and I was eating the bark of the trees, a white man found me and took me to his cabin.'

'Good man!' cried Billy enthusiastically.

'I pay back now what I received then, according to the promise given, though none was demanded. The priest whom this man slew was a bad man. He killed the shaman, who was my father, foully. He made us work for his profit; and he bought our furs at a poor price, which we took lest he should send us to the white man's hell. Now he is dead. That is good. I shall be shaman and the head man of the tribe in my father's place, and the bad priest's robes will be mine. I shall be the greatest shaman in the land, for I know much that the white men know.' He broke off, his dark eyes alight with the fires of ambition, and then he asked abruptly, 'Ye will go in peace?'

'Yo' bet we will, shaman.'

'In peace,' answered Carwyke gravely, extending his hand. The Indian took it, held it for a moment, and spoke again.

'Then the canoe shall be prepared, and the stores. But you go at once. There are those who were the friends of the priest who——' He broke off. 'You understand?'

'Yes,' answered Carwyke; 'and we will leave when the canoe is ready.'

The shaman nodded. 'That is wise. I will gather the people in the church till you have gone, that there be no shooting in the back.'

He turned at the word, and, walking to the door, passed outside. Scarcely had he crossed the threshold when Billy spoke. 'Do yo' trust ther beggar, Mista Carwyke?'

'Yes,' answered Carwyke, without hesitation. He knew nothing of Father Arloff's hints to Standifer of coming trouble among the Indians, but the man's words and bearing had convinced him of his sincerity. 'The man means every word. And——'

He broke off as a moan came from Norma, and he turned swiftly to her. The girl's eyes were open, and she was looking about her in a dazed, bewildered fashion. Instantly he dropped on his knees and raised her in his arms. 'Don't worry! You are safe, Miss Norma. In a few minutes we shall be leaving here, and Billy and I will look after you.'

Norma looked at him with uncomprehending eyes; and for a moment he feared that the shock of recent events had been too much for her mind. It was Billy who guessed the truth.

'Missy's been doped,' he said. 'Look at her eyes an' yo'll see, Mista Carwyke. They'd never hev got her in ther church but for thet, I'll swear. An' ther fellow Mardock had swallowed a knock-out drop, too, or I'm a fool. He was all abroad when I came on him tryin' to break into thet log-shed where yo' was fastened, an' he couldn't talk worth mentioning.'

Carwyke looked at the girl in his arms carefully, and after a moment decided that his friend was right. For a moment anger surged within him as he thought of the vile means Standifer must have used in the endeavour to gain his will; then, lifting the girl, he carried her to the blankets in the corner, where he laid her whilst he attended to Billy's foot. The soft-nosed bullet had passed right through it and smashed the middle cuneiform bone, leaving an extremely nasty wound. There was little that he could do at that moment except bandage the foot tightly, for the surgery that was needed was quite beyond him.

'Tidy smash-up, ain't it?' asked the sufferer.

'Yes,' Carwyke answered sympathetically.

'I'm afraid you'll go lame for life.'

Eskimo Billy laughed. 'Then thet devil Standifer is finely cheated. He meant me never even to dot an' carry one again.'

Remembering Billy's remark about his shoulder, Carwyke removed the rough bandage to examine the place. The wound was a clean one, and, thanks to the healing air of the north and the recuperative power of the man's healthy flesh, was already mending. He bound it afresh, and by the time he had finished the task the young shaman was back at the door. 'The canoe waits,' he said. 'I will help the naked-shouldered one to the bank.'

'No hurry,' broke in Eskimo Billy. 'Ain't there a shirt of that priest's I could borrow. I ain't no picture for Missy's eyes like this.'

'What did you do with your anorak, Billy?' asked Carwyke curiously, as he turned to look for any garment that might serve to cover the other's naked shoulders.

'Used it to get down here in,' answered Billy cheerfully, without offering any further explanation.

Carwyke did not press him further at the moment, but continuing his search in what had evidently been Arloff's sleeping-chamber, found a gray flannel shirt and a mackinaw coat, which he carried to Billy, who promptly put them on, and fell to laughing at their bigness. Then, Carwyke carrying Norma and one of the rifles, and Billy, also with a rifle, leaning heavily on the Indian's shoulder, they passed from the house.

Except for Mardock's body, the open place in front of the river was deserted; and in a silence that was broken only by the half-suppressed wail of a child which came from the interior of the church, they moved towards the bank. Their progress was slow, and before they reached the canoe the crying child was hushed, and the intense stillness of the village once more impressed itself upon Carwyke's mind. But for the reassuring look on the grotesquely painted face of the shaman he would have interpreted it as being inimical; and, as it was, until they reached the river-bank he did not so much

as look round. Going down to the canoe, he placed the drugged girl carefully in it, watched Billy shake the shaman's hand, and heard him voice his gratitude. 'Thanks, shaman; yo're a white man, I reckon.'

Then, whilst the Indian glanced at him inquiringly, Roy Carwyke pointed to the dead man lying in the open with clouds of flies buzzing round. 'That man was our enemy at first, but at the last he was a friend. It is not meet that he should lie there, or have the burial of a dog.'

The horned head nodded understanding. 'He shall have the burial of a warrior after the ancient tribal custom, and the women shall mourn him for three days. I, who am now the shaman, will order it so.'

'Thank you,' said Carwyke, for one moment visioning Mardock with a spear by his side, and food for his journey to the happy hunting-grounds, whilst copper-skinned women wailed dirges in the woods. Then he took his place in the canoe. The shaman thrust it out to the current, and waded back to the bank, and with the strange silence unbroken they swung forward. Once more did Carwyke look back, to see that strangely bedizened and horned figure standing on the bank watching them. He lifted his paddle in a farewell salute, the Indian waved in return, and then Eskimo Billy's voice broke the silence. 'A bloomin' medicine-man! Ther Lord be good to him, as Missy's father would hev said.'

(Continued on page 377.)

THE REMARKABLE TRAGEDY OF DUNSTAFFNAGE.

By M. E. M. DONALDSON, Author of

Wanderings in the Western Highlands and Islands, Islesmen of Bride, &c.

MOST visitors to Oban find their way to the royal Castle of Dunstaffnage, nearly midway between that town and Connel Ferry. The guide-books tell them little else than the old fiction, exploded by Dr Skene, that Scotland's ancient coronation stone, now in Westminster Abbey, once reposed here. Few people, however, are likely to find in this information a sufficiency of thrills to lift from them the sense of depression which the very dejected and neglected ruins of the castle generate. Its principal historical associations are soon told. In 1308 the Bruce took Dunstaffnage from the rebellious Macdougall, Lord of Lorn, and garrisoned it for the Crown; the famous 'Donald of the Hammer' attacked the castle to avenge his father's murder on Eilean Stalcaire by 'Colin the Green,' the then constable; and the renowned Flora Macdonald passed a few days within its walls as a prisoner on her way to Leith. If this were all, however, it were little indeed, and quite insufficient to arouse a living interest in the old castle and its vicinity amongst the majority of people. Since most guide-books—after their wont—omit to mention the most interesting thing to be seen at Dunstaffnage, probably only an inconsiderable percentage of visitors find their way to the chapel, situated, very unusually, apart from the castle in a wood some 160 yards short of it. This building, however, is much more interesting than the castle itself, and not only so by reason of its architecture, which is of an order very superior to that prevailing in typical West Highland churches.

When for the first time I approached the chapel, I at once became acutely conscious of entering into an atmosphere that suggested the brooding spirit of some bygone incident, mutely

striving to tell of a tragedy beyond the ordinary. The material environment was not sufficient to account for this impression being made upon me, though, indeed, the dark firs so closely shadowing the ivy-covered shell set the seal of gloom on the place. When I entered the ruined chapel I found I had passed out of the eerie atmosphere without, so that I was doubly sure that it was not due to the only incident of which I then knew—one only partially associated with these ruins.

That incident concerned the end of Old Colkitto, the rascally father of the great Montrose's famous lieutenant, Young Colkitto Macdonald. Old Colkitto's lurid career closed in 1647 at the siege of Dunaverty Castle in Islay, the gentleman then being seventy-seven years old. Seemingly it was owing to treachery that Old Colkitto was made prisoner and confined for a while in Dunstaffnage Castle, Campbell of Dunstaffnage, its hereditary constable, being apparently an old acquaintance of his. This circumstance, however, did not avert, or even mitigate, his fate. Evidently with an eye to fitting as nearly as possible the punishment to his crimes, the old pirate was hanged from the mast of his own galley. This extemporised gallows was placed over a cleft in the rock through which the road to Connel now cuts, the rock itself being then part of the 'hill of hanging,' without which no Highland castle was properly equipped. Tradition says that, in accordance with his dying request, Old Colkitto was interred near to the place where Campbell of Dunstaffnage himself would be buried, that so they might be enabled to exchange snuff out of each other's snuff-mulls! Obviously the memory of an incident of this

nature would at once dissipate any sense of overhanging tragedy—if, indeed, a hoary villain like Old Colkitto was capable of creating an atmosphere at all approximating that of which I was sensible.

On the second occasion I had the same experience, for which, again, I still knew nothing to account. The atmosphere once more conveyed, by the intensity of its oppression, the idea of striving to become articulate. Before I returned the third time, however, it was a matter of great satisfaction and intense interest to me to have discovered the explanation of these eerie impressions. It was the tale of a very strange tragedy that had enveloped the chapel in an atmosphere so local that its absence from the interior was equally extraordinary. The apparent reason for this will be obvious later.

But since the vicinity of the chapel of Dunstaffnage was but the scene of the climax of a series of little-known happenings in Highland history, a brief account of these interesting incidents must precede any relation of the remarkable tragedy of Dunstaffnage. This tragedy is concerned with the history of the lordship of Lorn, founded by Dougal, progenitor of the Macdougals, and the eldest son of Somerled, Lord of the Isles. It was through lack of an heir, and the marriage of the two co-heiresses of the last Macdougal with two Stewart brothers, that, in 1386, the lordship of Lorn passed to the Stewarts.

Sir John Stewart, locally known as 'Lipper (leprous) John,' and reckoned the third of Lorn, had, by his first wife, three daughters only. These in due course were married to three lairds of the Campbells, a family that had not yet attained to the power they subsequently acquired through the exercise of those methods that are associated with the clan. But amongst the three husbands was Colin Campbell, who had already become first Earl of Argyll, and he, with the astuteness never lacking in his house, was ever on the outlook for subtle means whereby to strengthen and consolidate the Campbell position and influence. But Sir John Stewart's dispositions soon made it very evident that he had no idea of allowing the lordship of Lorn to pass out of the Stewart family. By every step he took to secure the lordship after his death Sir John proved himself to be a man of great ability and foresight, with one purpose, steadily pursued, kept ever before his eyes.

It was apparently after his first wife's death that, on his way back from the Tryst at Crieff, Sir John met in Glenfillan a wedding-party of the Maclarens of Ardveich. The Lord of Lorn joined the merry company, and promptly fell in love with the daughter of the chief. By her he had a natural son, Dugald, and it was this son whom Sir John wished primarily to succeed him. But before taking the necessary step to legitimise the boy, the Lord of Lorn sought to

entrench Dugald's position by every means that his far-seeing wisdom could dictate. Danger he anticipated might arise in three quarters. There were the ambitions of Argyll, all the more to be guarded against because the methods by which he advanced them seldom appeared on the surface. There was the envy of the chief of Clan Dougal, who was in the undignified and anomalous position of being without either castle or lands in the country where, formerly, his ancestors held full sway. There was Sir John's next heir, Walter, the eldest of his four brothers, a weak and unreliable man, who would prove a pliant tool in the hands of any one who chose to make use of him. Thus the Lord of Lorn's first concern was to deal with all these threatening contingencies by making various dispositions designed to placate these several potential enemies. The successive steps by which Sir John sought to assure Dugald's position are of interest, if only to illustrate the shrewdness and other statesman-like qualities that characterised this Lord of Lorn.

Dugald was born in 1445. In 1448-49 the marriage contract was drawn up by which Sir John's three daughters received honourable provision of lands, all carefully specified. Sir John next proceeded, in 1451, to draw up a deed granting, with great generosity, to his kinsman, John M'Alan M'Coule (the ancient form of Macdougal), several lands in Lorn, all duly enumerated, and conferred on him and his successors the hereditary bailiesship of Lorn. But as events were to prove, the drawing up of this deed was not equivalent to drawing the Macdougal tooth, as Sir John had fondly hoped. The Lord of Lorn then came to an understanding with his kinsman, James II., by which he resigned all his lands into the hands of the Crown, only to receive them back in order to render his position impregnable. This was accomplished by two charters that Sir John received from the Crown, both dated 20th June 1452, securing to himself and his lawful heirs male, whom failing to his four brothers successively and their lawful heirs male, beyond whom even further heirs male were designated, the lordship of Lorn and all other dignities appertaining to Sir John which, together with their lands, are all most clearly set forth. It is abundantly plain from all this that Sir John Stewart took every possible precaution both to exclude his daughters from any share in the lordship of Lorn, and to ensure against its alienation from the Stewart family through their marriages.

All these prescient settlements having been made, the time had come at length when Sir John Stewart could consummate his dispositions by taking the step that would legitimise his only son, Dugald. Thus in 1463 a messenger was sent to Ardveich (on the north shore of Loch Earn) summoning Dugald and his mother

to meet the Lord of Lorn at his fortress of Dunstaffnage, where the marriage was to take place. The bridal party, with pipes playing and banners flying, duly set out on the journey, supported by an escort of Stewarts from Lorn and Maclarens from Balquhiddar. According to a Maclaren tradition, on the way Dugald was intercepted by an old spaewife, who asked, 'Whither are you going to-day?' Dugald replied, 'What is that to you, old woman? I am going to receive some little justice.' 'Well,' returned the spaewife, 'I have something to say to you. I have had a dream that as you have been known for eighteen years as Dugald of Ardveich, so you will be for twenty-eight years known as head of the Stewarts of Lorn.'

There are still extant some Gaelic verses written by one of the clan bards to commemorate this memorable occasion. Freely translated, they run as follows:

'That day you left Lochearnside with your gentle mother on your arm, you were a hero tall and powerful, and well did your mountain dress adorn you.

'Before you was a banner and a pipe playing gladly; your sword naked and gleaming in your hand; your company the youth of Clan Laurin—men tall, sprightly, and full of activity.

'Young Dugald, akin you are to him now wearing the royal crown; and in your pulses is flowing gleefully the blood which makes you of a mighty race.

'Great will be the feast in yon Dun in the west when, with graceful courtesy, you both reach it.

'Now may health and bliss never failing attend the wife now leaving for Dunstaffnage!'

It was on 20th December 1463 that this wedding, constituting one of the most remarkable marriage ceremonies on record, took place. Naturally to the nuptials of the Lord of Lorn came his kinsmen and clansmen from far and wide, and amongst the former was Alan M'Coule, second son of the chief Macdougall. The Stewart tradition states that it was when the wedding procession was nearing the chapel that M'Coule sprang suddenly out of the crowd, and thrust his dirk with fatal effect into a vital part of Sir John. That the murderer and his accomplices were able to escape was doubtless due to the paralysing effect that this utterly unexpected happening must have had upon all the company. Dugald Stewart, as a true Highland son, would have instantly gone in pursuit of his father's murderer but for the officiating priest's earnest representation. He urged the necessity for delaying thoughts of vengeance in order that the marriage might still take place. Sir John still breathed, though his moments were obviously numbered. Indeed, so far gone was the bridegroom, that it was only with the priest's assistance that Sir John was able, in an expiring

effort, to place the ring on his bride's finger in the presence of the awe-stricken gathering of people.

Alan M'Coule, the murderer, was clearly actuated by the desire to be rid of a formidable obstacle in the path of Macdougall ambitions, for Sir John's generosity had done nothing to abate Macdougall designs to recover their lost lordship of Lorn. Probably Argyll made skilful use of this knowledge, for there is little doubt that, if Alan M'Coule's deed was not directly instigated, it was at least encouraged, by Argyll himself, who, as usual, carefully kept in the background. It would appear, too, that Walter Stewart, an easy tool in Argyll's hand, was also privy to the assassination. As next heir to Lorn if his brother's marriage were frustrated, he had everything to gain by the murder, which Argyll was astute enough to see was also the first step towards the attainment of *his* own ambition, likewise the acquisition of the much-coveted lordship of Lorn.

With the incident of this strange wedding in death, Dunstaffnage passes out of the story, the sequel of which, however, may be briefly summarised in order to complete the tale of the last Stewart Lords of Lorn. The incident of the extraordinary happening at Dunstaffnage spread into every quarter of Lorn, though those whose plottings were temporarily foiled by the marriage ceremony were able to prevent the news reaching the Scottish capital. In Lorn itself, Dugald Stewart was at once accepted by all the clansmen as their rightful lord, and during his lifetime the men of Lorn followed him most faithfully. But behind his back in Edinburgh Dugald's claim was disputed by his false uncle, Walter, who, with the support of Argyll, as Justiciary of Scotland, succeeded in securing recognition of his claim. Though no one in Lorn would follow Walter, the irresistible force of might overrode Dugald's right, and he was compelled to give up to Walter the greater part of Lorn, retaining only the district of Appin, of which he became first chief. Now the climax of these complex intrigues is reached. In return for Argyll's support, Walter, whilst retaining other Stewart possessions and titles, made over Lorn to the wily earl, who thus, by tortuous methods and without striking a blow, attained his ambitions, so that now the Duke of Argyll includes the lordship of Lorn among his titles. As for poor, unfortunate Dugald Stewart, his unquiet career came to an end in 1497, when he fell in a battle in Glenorchy.

Dunstaffnage, as the scene of this double death-blow—to Sir John and virtually to the Stewart tenure of the lordship—may rightly be regarded as the shrine of Lorn memories of old time. And for those who know the tale of this wedding tragedy, the ghost of Sir John Stewart will always seem to haunt the frowning precincts of the ruined chapel of Dunstaffnage.

SEVENTH SERIES

SMALL-GAME SHOOTING IN CANADA.

PART I.

I.

SOME years ago a friend of mine built himself a barn on the border of one of our great northern lakes. He called it a bungalow, and I understand that, since then, it has been improved into a really good shooting-lodge. At the time I speak of, the planks whereof it was composed were thin, and you could see the stars at night through the cracks and the knot-holes.

We got caught there one winter, having succumbed to the temptation of an unusually late fall and stayed on too late into the month of November. The duck-shooting was superb. The mallards had been fattening on the stubble until they weighed about four pounds apiece, and dropped into the lake with a resounding splash that was satisfactory evidence of a clean shot. The cold snap came on quite suddenly. One day there was just a thin glassy fringe round the shore-line, and the next we were breaking ice for nearly three-quarters of an hour, by down-driven thrusts of improvised poles and the butt-ends of our paddles, before we could get the canoes into open water. By three o'clock in the afternoon we had to turn it up. I had on all the clothes a man could well accumulate on his person and yet leave himself free to get his gun to his shoulder. But the wind perforated corduroy coats and woollen sweaters as if they had been thin summer pyjamas, and every drop of water on the gun-barrels congealed at once into a sort of clear, solid jelly.

We put out from our 'hides' and paddled vigorously round, picking up our dead birds, in the hope of rekindling a little warmth in our frozen bodies, if possible, by sheer hard exercise, but it was no good. The duck were flying beautifully, but our fingers were almost too numb to handle the paddles, let alone the guns. And so, reluctantly and half-ashamed, we returned to our shack, and spent the rest of the day cramming wood into the stove with reckless prodigality.

Next morning our water-pails were solid ice and our sponges lumps of coral. We spent that day on land, shooting prairie-chicken, without much success, for the birds were wild and we

were too busy walking fast in order to keep warm to be careful about approaching them. The following day we piled all our camping-outfit onto a big farm-wagon, which is called a 'democrat' here, and started off for our long drive to the railroad. We had a big bag of game with us, the result of some weeks of shooting, and it fell to my lot to pitch bunches of frozen duck and prairie-chicken from the cart onto the platform of the little station. I can hear now the ringing smack with which they landed on the planks; if you had had your back turned you would have sworn I was throwing wooden decoys. Half-an-hour later we were heaping maledictions on the nigger-porter for overheating the car, and shedding all the clothes we could consistently with the conventions of civilisation. We swore a solemn oath never to be caught that way again, and we have kept it, largely because the barn is now a pukka bungalow, and, with a proper supply of wood, you can be comfortable there in the coldest weather.

All this is the dark side of the shield; there is another, and a very different one. It was only a year or two later that my companion started off in his canoe one morning and came back to lunch with thirty odd duck. In the afternoon he picked up ten brace of prairie-chicken, and, on his way home, shot over a small swamp and bagged about the same number of snipe—all to his own gun. Now just consider how much an Old Country man would pay in rental for such shooting as that implies.

The railway 'folders' and the moving-picture exhibits of shooting in the Dominion usually 'feature' moose, caribou, and wapiti, or mountain-sheep and grizzly bears, and pay little attention to the 'small deer'—grouse, wildfowl, snipe, woodcock, &c., in which Canada abounds. The number of big-game hunters is limited, if only because it is a rich man's sport. Such shooting as I have been talking of really costs a resident very little more than the price of his cartridges.

I have shot duck in times gone by, year after year, when a party of eight or ten of us, including sometimes women and children, camped for weeks on the shores of one or other of the big lakes. We were twenty or thirty miles from

the nearest white man, and we took very little with us in the shape of provisions, beyond flour, tea, sugar, oatmeal, maple syrup, and a certain amount of bacon, in case of accidents.

There was a wooden building, very much like a small cricket-pavilion, facing the lake and about a couple of hundred yards from the water's edge. At each end of this was a small room where the women and the children slept. The main space (where the spectators would sit in a pavilion) was our general sitting-room. This had a kind of wooden curtain, which could be let down at night, and, as it opened outwards, could be propped up by poles, thus converting the front into a sort of veranda during the daytime. We found it better eventually to build a separate hut for a dining and store room near-by, and erected that ourselves with such tools (mainly a couple of axes) as we brought with us. Here we kept all our provisions on shelves, as we were pestered by a number of Indian train-dogs, whose owners were camping on the opposite bank of the river. The brutes would swim across at night and devour anything they could get at—they would bite through a can of tomatoes or preserved fruit as though it were paper.

The door bothered us for a time, as there were no hinges to be procured within fifty miles, till at last some genius suggested cutting strips of dried bacon-rind and nailing them on to serve the purpose. This idea was hailed with enthusiasm, and we spent a long time swinging that door to and fro to show how beautifully it worked. A couple of nights later we heard a terrific row round the hut, and lay in our tents chuckling gleefully over the superior efficiency of the human brain. The racket lasted so long, however, that we turned out to drive the dogs away. Then we discovered that those four-legged burglars had eaten our door-hinges, and were on the table pulling our shelves down. After that we loaded a number of cartridges with coarse salt, and made things so unpleasant for them that they remained on their own side of the river.

II.

The first night we arrived in camp we stretched a net, about four feet deep, across the mouth of the neighbouring channel. We turned out in the morning about daybreak and ran across the sand for a swim, after which we got into our flannels and walked up and down the beach eating our porridge. Then we got out the canoes and overhauled the net. One day we failed to find it, and concluded it had been torn away by a heavy gale from the north which had been blowing all night. Two or three days later we spotted one of the floats in the reeds up-channel, and then recovered the net, so full of fish that it took us more than half a day to disentangle them. We always threw back what

we didn't need for food, but there was never any lack of fresh fish for breakfast.

After that we got into our canoes and started for a two-mile paddle up the river till we struck a cross-channel leading into the big swamps.

To the average Old Country man the word 'swamp' suggests mud, but, although there were mud-banks here and there, these swamps were mainly great lagoons of fresh water, stretching away for miles inland, and studded all over with islets of reeds. It was the easiest thing in the world to lose yourself there—the Hampton Court maze was mere child's play compared with them; but with a general idea of the points of the compass one could always find one's way out. Still we did once hear plaintive cries for assistance about daybreak, and found a nearly crazy man who had been out all night. He was on foot, had lost his way, and was leaning on his gun, afraid to move lest he should sink in the soft mud. He was too exhausted to shout, and was moaning and weeping, and—as usually happens on these occasions—was within ten easy strides of the mainland, and had never been in any real danger.

Once away from the main channel we would pick a promising patch of reeds with plenty of clear water round it or in front of it, so that we could see where our birds fell, and drive the canoe right into it with two or three strong strokes of the paddle. Then we grasped a handful of reeds, twisted them round so as to serve as a rope, and tied them round the thwarts, fore and aft, so that the canoe became a steady platform to shoot from. If there were two guns on board, one man faced forward and the other astern, each having his cartridge-bag open on the bottom of the canoe in front of him. By this means each could cover half the horizon and, when he saw ducks approaching, could quietly warn his companion to be on the look-out, right or left, as the case might be.

On a windy day wedges and skeins of ducks would be flying in all directions, and I have shot till my gun became so hot I had to dip the barrels in the water to cool them. The main difficulty lay in collecting the birds afterwards. At this job an Indian was worth a dozen white men. I remember well my first experience of this work. At the end of an hour I must have had a dozen birds or so down near my first 'hide.' Then my Indian paddler suggested collecting these and moving elsewhere. Five minutes after we had picked up the first bird I couldn't have found the original 'hide' again, let alone the remaining birds. And yet my Indian picked them up unerringly one after the other, twisting and winding up and down narrow channels and across open spaces as if he carried a complete chart in his brain—which he probably did. On these occasions our lunch consisted usually of a bar of chocolate and an apple, although on

a very long or cold day we would take a kettle and some tea. How we were going to boil that water was a mystery to me in my tenderfoot days, and yet it was quite simple. The Indian produced a small faggot of sticks from somewhere (an Indian will boil a kettle with the wood a white man will use to start a fire), grabbed a handful of reeds on each side of the canoe, bent them over and plaited them together into a sort of platform. On this he disposed his little faggot, arched over more reeds on which to hang his kettle, and the water was boiling cheerfully before the reeds were more than barely singed.

We usually wore old flannel or duck trousers, and woollen sweaters of some shade that matched our surroundings. One day I remember I had on a green sweater speckled with yellow, just the same colour as the reeds. On my head was a straw hat—price thirty cents in the general store of the nearest settlement. Round the hat I had twisted a garland of reeds, and, as these grew higher than my head all round me, I flattered myself I was pretty well concealed. I had broken a clear space in front of me so that I could see to shoot, and I was considerably less surprised than were the duck when a flock of teal volplaned down very nearly on to my hat-brim. At about eighteen yards they opened up just right, and I pulled both triggers quick, one after the other, and had two miss-fires. I shall never get such a chance again as long as I live, and I spent the rest of the afternoon composing the speech I was going to make when I returned to civilisation to the man who sold me those cartridges. They were made by some new manufacturer in the States, and I have no doubt that to-day he is a billionaire as the result of selling defective ammunition to the Allies through the earlier years of the war.

Another day I nearly got a chance of bagging a bird and a fish with the same shot. Perhaps it is as well I didn't succeed, or my reputation would have been that of the man who killed the big tarpon. He had it stuffed and presented it to his club, and overheard a visitor one day remark, 'The man who caught that fish is an infernal liar.'

The way of it was this. I was crossing a stretch of open water in a canoe, with my gun in my hand, and an Indian paddling in the stern. There was a solitary duck ahead of me, and I paid very little attention to him at first, as I was quite sure he would be up and off before I got within shot of him. Still he remained where he was so long that I had begun to consider the chance of a long shot, when he suddenly dived with a tremendous swirl. There was something queer about the way he went down, and the Indian got very

much excited, crying out, 'Big fess! big fess!' His keen eyes had spotted a huge pike grabbing the luckless bird from below. He asserted positively that he would come up again, so I got my gun ready and kept a sharp look-out on my left, which was the direction in which he was heading when he disappeared.

Unluckily he broke water about twenty or thirty yards on the other side of me, and it is not easy to swing round quickly when you are kneeling, cramped up in the bows of a canoe. Before I could shoot he was down again. He came up a second time, but too close for a shot, so close indeed that the Indian struck at him with his paddle and only just missed him. That was the last we saw of him, but had he got up where I was expecting him to on the former occasion, I could hardly have missed him, and as the pike was hanging on like a bulldog, I should in all probability have bagged the brace.

Every day or two the squaws from the Indian camp used to paddle across with pails full of wild raspberries or wild plums, which they would sell for a few cents, or trade for tobacco or discarded clothes. The annual shoot afforded an excellent opportunity for getting rid of old socks, flannels, and such like; we would wear them to rags and then pass them on to the Indians, who accepted them gratefully, and wore them on Sundays to the little mission church, hidden away in the willows, where they had a native preacher who had been a member of one of the expeditions in search of Sir John Franklin.

Furthermore, we usually took a small supply of medicines with us in case of sickness. I never remember an occasion on which we needed any ourselves, and, on the last day, we used to parade the neighbouring Indians and distribute all the stuff we had no use for. The medicine was always in request, especially the seidlitz powders, for they had an idea that the effervescence was exhilarating. When the preacher came to dine with us, as he always did once or twice a week, we invariably gave him a dose of paregoric to drink with his meal, and his grace both before and after was so fervent and long as to make us rather ashamed of ourselves. Nothing in the world would have induced him to touch alcohol, for he was a very conscientious old gentleman, but somehow the production of the paregoric bottle unfailingly provoked a beatific smile. Being Indians, they were quite incapable of storing up for a rainy day, and they always finished the medicine then and there, dividing it up into equal shares. We took care to be ten or twenty miles away before the trouble began.

(Continued on page 394.)

FORESTALLED.

CHAPTER III.

SLOWLY the red mist of wrath and battle faded from before Tom's eyes. He blinked feebly, like one dazzled by a sudden burst of unexpected sunshine. He passed his hand over his face to wipe away the blood and sweat that prevented him from seeing clearly. He perceived that there was standing between him and his adversary a small and lovely figure, that of a young girl, very graceful in her bearing, with clear-cut, delicately-chiselled features, her head crowned by a mass of golden curls, and with wonderfully bright blue eyes, in which wonder and surprise were now beginning to give way to a flashing indignation. Lifting one tiny hand with a gesture that was somehow oddly formidable, as though it indicated a strange and hidden strength that she possessed, she said in a clear and ringing tone, 'What has been happening? What have you been doing? Dad——?'

'It warn't me, Joyce; it warn't, honest,' declared Tom's late adversary with undisguised anxiety.

Tom, staring bewilderedly at his enemy, saw that the fierce glare of combat had faded from his eyes, that his lips were no longer grimly set, but curved into a timid and propitiatory smile, that his whole air and manner had changed all at once to a deprecatory bearing that might have been that of a dry-goods salesman trying to explain to an angry customer why he had been selling inferior stock at a high price. And this change in one whom he had known as so stout and strong an adversary astonished Tom very greatly, and would have astonished him still more, only that he felt that some sort of similar change had happened to himself.

He felt Joyce's clear and severe and indignant eyes rest upon him for one scorching moment, and he wished they wouldn't. Why should she look at him as though he were some specially obnoxious worm? To his relief she turned that disconcerting gaze of hers from him to her father, and said coldly, 'Please tell me how this happened.'

'Came for me like a mad bull, he did,' declared her father, 'hollering and shouting most outrageous, and first thing I knew, there he was, trying to use me for a punching-ball. What could I do, Joyce? Put yourself in my place,' he begged her. 'Wouldn't you have done just the same as me?'

'You promised me faithfully,' Joyce said coldly, but little touched by this pathetic plea, 'that you would never fight any one again.'

'I know I did,' confessed her father sadly, 'seeing you made me, but this wasn't no fight.

He just came for me like a mad bull, and, before I knew it, there I was, trying to keep my end up and no more.'

'Well, I call it disgraceful, and very disgusting as well,' declared Joyce, only half accepting these excuses. She whirled round on the still bewildered Tom. 'Who are you?' she demanded. 'And what do you mean by it?'

Tom blinked again and gasped, but did not speak. It struck him as the most curious and interesting circumstance he had ever known, that though he was still upon his knees his head was almost on a level with hers, and he found himself watching with wonder the golden glory of her curls above her white and level brow.

'Well?' she snapped indignantly.

He tried to say something, but when he opened his lips no words came, and then he perceived, with a shame and horror beyond words, that his shirt was split from throat to waist.

'Oh my!' he muttered, his whole body one enormous blush, and sinking in upon himself in a way that the heaviest blow had never made him do, he put out a desperate and grasping hand to reach his coat.

'Can't you speak?' demanded the girl. 'Are you dumb as well as savage and a brute?'

Even in the anguish of his tormented modesty that feared hers had been troubled, Tom heard and writhed at these rebuking words. But in fact he was for the moment dumb and utterly unable to speak. However, he managed at last to reach his coat, and he felt a little better when he had pulled it over his shoulders.

Joyce turned to her father and said, 'Is he really dumb? Do you think he can't speak?'

'Dumb nothing,' declared her father emphatically. 'You just ought to have heard the way he hollered when he went for me the way he did. Plumb crazy he may be, but about as dumb as a roaring bull.'

'Well, but,' argued Joyce, 'why doesn't he answer when I speak to him?'

'Expect,' remarked her father virtuously, 'he's ashamed.'

Tom, still upon his knees, threw a menacing glance at his adversary. It meant, all right, he wouldn't forget that, and when the chance came—— But, unfortunately, Joyce caught this look thrown at her father, and was evidently most unfavourably impressed. Certainly she had made her father promise to quit fighting, and she meant to keep him strictly to his word—no excuse accepted—but all the same evidently he had to be forgiven if he had simply been attacked by a dumb maniac, as she was now

beginning to suppose Tom must be. But she felt she must try once more to see if she could get a reasonable answer out of the big, hulking fellow.

'Will you please tell me,' she demanded, 'who you are, and what you want, and why you were fighting my father?'

'I didn't know he was your father,' declared Tom; 'hadn't a notion in the world.'

'And I wasn't fighting him,' urged Joyce's parent. 'It was—self-defence,' he cried with a sort of joyous triumph at having at last found a phrase so splendidly exculpatory—'just self-defence.'

'I was here first,' urged Tom. 'I only told him he had to git. Of course I hadn't an idea in the world he was your father.'

Joyce made a helpless gesture with both hands, as if abandoning the attempt to understand, and her father exclaimed, 'There, you see. Ain't that just what I said? "Git," he says, and before I could ask him civil and kind-like what for why, he caught me a wallop in the eye, making it same as you see. What else could you have done yourself, Joyce, but hit him back just as hard as you knew how?'

'You hit me first; you got the first one in,' protested Tom, stung to protest by this shameless perversion of the truth.

'Well, as it seems you can speak when you want to,' said Joyce, 'will you please tell me who you are, and what you want?'

Tom subsided into silence again. He felt quite unable to explain who he was—always a large and difficult question—and as for what he wanted, why, he hardly knew that himself—only that whatever it was, he wanted it very badly. But he felt strongly that it was not fair to throw a man into such a conflicting whirlpool of wonder and emotion, and then fire off at him questions of so bewildering a nature.

So he did not answer, and Joyce thought he was sulky, and surveyed him with a disapproval more marked than even before. Nor was he at the moment an altogether prepossessing object, for he was covered almost from head to foot with perspiration, blood, and earth, his clothing was torn, his features bruised and swollen. Indeed, in spite of the fact that neither man was really damaged to any serious degree, the amount of blood they had managed to extract from each other, and the general condition of themselves, and of the scene of conflict, would have done credit to a miniature battlefield. With her little air of disgust she turned away. 'Horrible,' she said; 'I think the man's a fool as well as a brute.'

'That's about it,' declared her father with an unctuous approval that made Tom yearn for the chance to hit him twice as hard and twice as often as he had so far succeeded in doing. 'You've got him just about sized up, Joyce.'

'I hain't, neither,' Tom burst out.

Joyce swung round on him abruptly; and a little as if speaking to a peculiarly ill-conditioned child incapable of understanding anything except severity, she said, 'You can speak when you want—just listen. Tell me who you are, and what you want, and why you attacked my father?'

'I didn't,' protested Tom. 'I only told him he had to git.'

'Why?'

'I was here first,' Tom urged. 'I've been looking for this valley for five years—how I've looked! Well, when I found it, I just turned my back to get my stores up, and he slipped in—it made me mad. If he had been here first I wouldn't have said a word—but for him to slip in like that when I had only turned my back after five years' search! Well, I told him he had to quit, that's all.'

'You had no right,' decided Joyce. 'There was no one here when we made our camp ten days ago, and there's no claim pegged out. We've as good a right here as you, and as good a right to try out where we want to.'

Tom, who by now had got to his feet, shuffled uncomfortably. This was putting things in a new light. It occurred to him that possibly in the shock of his disappointment he had acted too hastily. He did not speak, and Joyce surveyed him with increasing severity, more and more unfavourably impressed every moment. 'If you think you've any grievance, you can complain to the Mounted Police,' she said; 'but surely the valley's big enough for us both?'

'Just what I said to him,' declared Joyce's father, much pleased, 'and then he went for me like a mad bull. "Git," he says; and I says, as polite and nice as pie, that if he hadn't any real objection, and it wasn't really troubling him too much, we should think it awful kind if he would be so good as to be so obliging—'

'That'll do, dad,' interrupted Joyce, who did not recognise in this speech her father's usual style.

'My, he can lie,' declared Tom with a certain awe; 'most as well as he can fight.'

'Apparently,' said Joyce, 'from what you say, you think you have some claim on this valley, and you make a brutal attack on us to try to force us to go away. Well,' said Joyce firmly, 'we aren't going, no matter what you do.'

Not going! He hoped to goodness she wasn't. Why, the mere suggestion was enough to throw him into a panic. Heavens above, if necessary he was prepared to drop upon his knees again to beg her to remain.

'Please understand that once and for all,' continued Joyce with undiminished firmness. 'We are not going away from here to please you.' (To please him, the overwhelming, the

incredible irony of it!) 'We intend to try out when and where we think fit, and if you don't interfere with us we sha'n't interfere with you. You seem,' she went on slowly, emphatically, and devastatingly, 'to be an exceedingly unpleasant person. You can't answer when you are spoken to; you appear to be as stupid as you are sulky and brutal; you try to drive away people who have as much right here as you; you make my father fight you when he had promised me ever so faithfully to quit fighting for good; and,' she added thoughtfully, 'you look very horrible and disgusting as well. So will you please go away and not come near us any more.'

She paused, a little breathless. Tom had not missed a word she said, any more than the condemned criminal misses a word of the doom that sentences him to death. With the air of one who has said, and said well, all that is necessary, she turned again to her father. 'Just look at your shirt,' she exclaimed despairingly—'and it's the best one. And your trousers, too—and the only pair you've got. It'll be hours before I can make you look decent again. Gracious, your eyes and your ear as well. And whatever can I make a bandage of when we're so short of everything? If it isn't simply just too bad.'

CHAPTER IV.

RUEFULLY enough, indignant and depressed, Tom watched the two vanish within their shack, and then he went a little way off and sat down under a tree and tried to think things out.

The chief sensation he felt was that of an extreme and bitter resentment against the eternal injustice of things, especially as exemplified in the recent brief address wherein Joyce had summed up his character and his career. How she hated him, how she despised him, how completely the flash of her eyes and the ringing tone of her voice had wiped him out of the list of those created objects worthy of her consideration! He supposed that for her he no longer even existed, and this impression made him very sad and very angry. He perceived that for his part he disliked Joyce more than he did any other living creature.

This surprised him somewhat, for the sensation was not one of which hitherto he had been aware, but now he experienced it with overwhelming strength. 'Brute, am I?' he muttered darkly; 'and disgusting, am I? and very ugly as well—and she don't want to have anything more to do with me? Anyway, I don't want to have any more to do with her, the little wild cat.' This expression pleased him greatly, and he repeated it aloud. 'Wild cat,' he said; 'that's what she is, and I'm sorry for any man that marries her—I am so.'

He shook his head gravely as he reflected on the awful future before the man who married Joyce, and he only wished he had a chance to pound the fellow, whoever he might be, into a jelly, the jelliest jelly that ever was. Not, of course, that he had the least wish to marry a wild cat himself, but the mere thought of any one else doing it—at least when the wild cat bore the name of Joyce—was frankly intolerable. Any such person would have to be—well, simply hammered.

'And then likely she would be madder than ever,' mused Big Tom Moore disconsolately. 'Wonder why girls is so powerful set against fighting when it's the easiest honest way there is to settle things.'

He shook his head sadly over this unfortunate feminine prejudice; and then as he meditated on the many mysteries through which leads the path that mankind has to tread, he remembered having heard of a man of the name of Billy Mervyn, generally known now as Old Man Mervyn, who was well known in the country as a prospector, and who was often accompanied on his trips by his daughter. Presumably, therefore, these two were Old Man Mervyn and his girl. And the shaft they had begun to sink was as near as possible on the precise spot where Tom himself had intended to start operations.

Not that Tom felt he cared about finding the gold now—or about anything else in the world for that matter. Life had become for him a bare and bitter and melancholy desert in which it was impossible to take any interest. When one was a brute, and a great stupid as well, and very ugly, too, what is there left to one but to sit apart and brood upon these lamentable facts?

He rose slowly, and proceeding to the creek, there removed from face and body the signs of the recent conflict. Then, with a certain amount of trepidation, for he was not sure that the door of the shack might not suddenly open and Joyce emerge to overwhelm him with a fresh torrent of denunciation, he returned to recover his pack, which he had thrown down near it. He went about this business very slowly; he stopped to cough once or twice, he kept an eye steadily on the shack, but nothing happened, and he felt he disliked Joyce more even than he had believed before.

'Thinks I'm no account,' he muttered; 'thinks I ain't worth even looking at; means to have nothing to do with me! All right. We'll see about that, we will; and, anyways, I was here first, and I ain't going to be scared away by no wild cat calling names.'

This decision arrived at, he felt much better and more cheerful. That was, he supposed, because by such a determination he gave himself still a chance to be the first to find the gold; and the idea that the rise in his spirits was also due to the fact that his decision

involved remaining in the vicinity of Joyce, and consequently seeing her again, never once occurred to him, for he was convinced that he detested her more than words could tell.

'No wild cats for me when I've made my pile,' he thought as he started work. 'It'll be hard luck days all the time for the man who marries her.' He drove his pick into the ground with a kind of vicious energy, as though he were aiming the blow at his deadliest enemy, as in imagination he was, for he pictured that blow as arriving on the head of Joyce's possible future husband.

He had been working for some time, and he had made good progress, for even at ordinary moments there was no better man of his hands to be found in all that territory, and to-day he was working like a man inspired, when he became aware that some one had drawn near and was watching him incredulously. He worked all the harder for that; earth and stones fairly spouted beneath shovel and pick, and then he heard a voice, of which he felt he knew every accent only too well, cry out loudly, 'Oh, look! look! No white man would do a thing like that.'

'Huh!' said Tom; and in the hole he had dug, in which he was sunk nearly to the waist, he leaned on the handle of his spade and glared defiantly at Joyce and her father.

For he knew that he was wrong; he knew that he was hopelessly in the wrong—and he didn't care a fig. This spot where he had begun to dig was but a few yards away from that where Mervyn and his daughter had started to sink their shaft, and to begin work so close to another man's shaft was to outrage every courtesy and convention of the country. No self-respecting prospector would ever have dreamed of committing such an outrage. If you suspect another man has made a strike, you may, of course, follow, to obtain your share of his good-fortune, which, after all, he has no right to keep entirely to himself. But you must respect the decencies; you must not begin your work right on top of his; you must give him fair-play and elbow-room. And all this Big Tom Moore knew as well as any man, and would, the week before, have hammered or pounded to a jelly, or otherwise rebuked and corrected, any living soul suggesting he would ever ignore these general decencies. But now he just didn't care, and there he stood and glared at Joyce; and she said again, her voice vibrant with indignation, 'No white man——'

'Huh!' said Big Tom Moore, and sent flying a fresh shovelful of earth.

Old Man Mervyn was hovering impatiently in the background, held back only by Joyce's restraining hand; but this shovelful of earth was more than he could bear, and he came forward furiously. 'Joyce,' he wailed, 'I'm bound to let up on that promise—I am so—he

ain't got no right, no sort of right whatever. Joyce, let me start in and lay him out.'

For a moment—a moment and no more—Joyce wavered. The case was flagrant. No decent man would do such a thing. If ever an appeal to force was justified—and her father could whip almost any one, and had already declared and protested that he had been on the point of whipping this stranger when her appearance had ended the battle—perhaps for just this once. . . . She recovered herself just in time, for her father had seen her hesitation and was already in the act of removing his coat.

She checked him with a quick gesture. 'Remember—you promised,' she said warningly; 'you promised you never would, never, never——'

'Joyce,' he urged pleadingly; 'I never meant——'

But she took no notice, and drawing a step or two nearer to Tom leaning on the handle of his shovel, she cried, 'Oh, aren't you ashamed to be so mean?'

'Huh!' said Tom slowly. 'When a fellow's been told he's a bully'—she nodded with heartfelt agreement—'and a skunk'—and again her agreement was obvious—'and ugly as well, not to mention a whole heap of other things . . .'

'Exactly,' said Joyce. 'I'm so glad we're both of the same opinion.'

Tom glared more horribly even than before. He had not expected that, and he realised that he was outmatched. In words she scored, but words wouldn't make him budge. He said sullenly, 'Well, then, when a fellow's all that, you can't wonder at what he does.'

'No,' agreed Joyce, even more amiably, 'you can't. It's only hard luck for us, just as it would have been if we had wanted to try out a place we found full of snakes.'

'Oh!' exclaimed Tom, quite staggered, for he had never supposed she would go so far as to call him a snake, and he felt that now indeed the limit had been reached.

'But we sha'n't quit for all that,' she declared, 'so you needn't think it.—Dad, we're playing in hard luck, having a——' She paused to search for the appropriate word, and at last, though with obvious hesitation, compromised on 'man,' '—in having a man like him around, but we'll just take no notice and go right ahead.'

Old Man Mervyn sighed. 'Things being as they are,' he said, 'I can't think you're acting right, Joyce, in holding me to a promise that, anyway, I only made because I had to, you saying you would go for a teacher down east if I didn't; and if only you'll give the word I'll undertake to lay him out that flat he won't take no interest in nothing more for a month of Sundays.'

'Huh!' said Big Tom Moore disdainfully, but also warily watchful lest a sudden attack should take him at a disadvantage.

'Dad,' said Joyce, 'a promise is a promise, and can't ever be broken. Now we'll start work.'

They turned away, and went back to where they had begun their shaft. Old Man Mervyn descended it. By the aid of a rough windlass they had installed, Joyce hauled up the earth her father shovelled in below. The silence of the valley resounded only to the blows of picks upon the hard gravel, to the fall of loose earth

thrown from shovel or pail, to the creaking of the windlass as Joyce hauled up bucket after bucket; and still Tom worked like a man possessed, burrowing ever deeper and deeper towards the former bed of the stream, where he hoped to find signs to tell him whether the rich pocket for which he sought was above or below—or had any real existence at all.

A CHRISTMAS HAIL-STORM AT PRETORIA.

By DAISY MOUNTAIN.

THE 25th of December 1923 will be a long and bitter memory in many Pretoria households. Nothing like the hail-storm that visited the Transvaal capital about 6 P.M. on the afternoon of Christmas Day has ever been experienced by the oldest inhabitant, and the havoc and damage wrought in one short half-hour was unparalleled. The damage to Pretoria Central, Sunnyside, and Arcadia was roughly estimated at something like £400,000; this, of course, included damage to furniture and fixings by the rain which followed and poured through holes made in roofs by the hail-stones.

The area of the storm was confined solely to Pretoria and suburbs, although the 'Reef' suffered in a lesser degree a few days later.

Christmas morning dawned bright and sunny. There was a slight cooling in the atmosphere, which, after the heat of the preceding days, was most agreeable, tending to increase the Christmas spirit of joy and goodwill. Folks wished each other a bright and merry Christmas in happy anticipation of the festive celebrations and pleasures awaiting in their homes, little dreaming that before the sun had set the scenes of mirth and merry-making would be changed to havoc and misery, whilst their pretty red-tiled houses would be battered and damaged, and in several instances families rendered homeless, their roof and furniture destroyed.

About midday the weather got very oppressive and sultry, but, this being nothing unusual at the time of the year in South Africa, little or no attention was paid to the fact. However, ominous black clouds loomed up on the horizon later on, and a hail-storm was predicted; as a matter of fact, two storms sprang up at the same time, travelling in opposite directions. The one, after passing the other, turned back and joined forces, with results most disastrous for Pretoria, as the clash appeared to take place very low down and directly over the town. After the storm had ceased the heavens appeared as a vast whirlpool, storm-clouds, all broken and churned up, whirling and moving in all directions—a truly awe-inspiring sight—with the rays of the setting sun low down on the western horizon.

At six o'clock the storm broke with a heavy

hail-storm. At first this was nothing out of the ordinary. Soon, however, loud reports like rifle-shots at frequent intervals coming from the iron roof convinced one all was not well. With dramatic suddenness the hail-stones changed to solid blocks of ice the size of tennis-balls, and, in some instances, frozen irregular chunks of snow, which, hurled from the sky, smashed in splinters on striking any hard substance. This deadly fusillade poured from the heavens in one continuous stream. The noise was terrific and deafening, reinforced by the force and fury of the wind. Green and purple streaks of vivid lightning caused a sight which will never be forgotten by those who witnessed the storm.

At Union Building many windows and tiles were smashed; otherwise the edifice suffered slightly considering its size. Government House, a little farther on at Bryntirion, was badly damaged, and some valuable furniture destroyed by the rain which poured through the holes in the roof. The Girls' High School at Arcadia, the Land Bank in Market Street, and the railway station were badly damaged. One hail-stone which fell at the station turned the scale at 1½ lb.

The pretty red-tiled newly-built houses round Berea Park were absolutely ruined, and presented a pitiful sight, the roofs being covered with sail-cloths and canvas until more tiles could be manufactured, all the reserve stocks of both tiles and window-glass in Pretoria being exhausted before the following day. Unfortunately this class of damage was not covered by insurance, but the town council took steps to help the sufferers. The loss to householders (many of whom had put their all into building their homes) must have been enormous, and the track of the storm supplied work galore for the unemployed and for trades-people to make good the damage.

Hours after the storm had passed the ground appeared to be covered with thousands of tennis-balls, and many of these hail-stones became frozen into blocks of solid ice along the kerbs and in other open places. The most surprising aspect of the storm was the small number of casualties. Two natives lost their lives by drowning in the Aapies River, which came down

in flood, and another was badly injured by hail in Church Street. One lady living in Arcadia unfortunately lost her life through shock brought on by fright and terror, and several cows had their hide pierced and horns broken off.

Lights and telephones failed, and the tangled masses of electric-wires that were brought down made walking no easy matter. Trees were stripped of their branches, and a promising fruit-crop completely vanished.

Boxing Day showed a brilliant sun shining from a sky of cloudless blue, with no signs of what had happened a few hours previously except the devastation and battered ruins of roofs and gardens. The despised and humble

corrugated iron roofs had bravely withstood the battering and hammering which had wrecked their more pretentious neighbours, and remained whole and intact. Truly the iron roof had come into its own.

The stability and strength of corrugated iron had stood the test of Nature's worst, and an outstanding feature in roof-repairs at Arcadia to-day is the stripping of tiles for the lesser glories of the staunch and reliable corrugated-iron roof.

Viewed in the retrospect, one cannot but admire the grand beauty and force of the storm, which was a stupendous display of Nature in a violent and terrific mood.

A GIPSY OF THE NORTH.

CHAPTER XVII.—THE GREAT MOMENT.

FOR a time, as he paddled, Carwyke spoke no word. He watched the woods on the bank carefully for any sign of Standifer or Bull, but saw nothing of either, and then quite suddenly Billy gave warning. 'Mista Carwyke, there's somebody in ther wood on ther right. It'll be as well if we work to ther other side o' ther river. If it's either o' them rascals there's no sayin' what tricks they'll be up to, as they're both runnin' free.'

Carwyke directed the canoe's course towards the farther bank, and then they paddled quickly, and, helped by the current, made a good pace. An hour passed, during which neither of them spoke; then the canoe gave a lurch, and the prospector saw that Billy had slipped forward. With an effort the man recovered himself, and Carwyke noticed that the poor fellow's face was drawn and gray. 'Billy, what——'

'I jest can't keep it up, Mista Carwyke,' said the man brokenly. 'This foot o' mine is jest blazin', an' I've a queer buzzin' in my head.'

Carwyke hid the anxiety he felt. 'Drop out awhile,' he said easily. 'Go to sleep, if you can. I'll manage.'

Single-handed paddling of the laden craft meant little more than keeping her head straight and moving with the current; but he understood how the man was suffering, and could urge him to no other course. Again for a time they moved on in silence, which was broken by the sufferer.

'Guess yo're wonderin' how I showed up jest when I did, Mista Carwyke?'

'I've wondered a good deal how you were able to follow so closely, Billy.'

'Twas simple enough, Mista Carwyke. Ther anorak I was wearin' was sealskin, an' I stripped it off, singed the fur away in ther fire yo' left, an' then stitched it over them holes in ther canoe, with strips cut off. There was lots of

gum in ther pines, an' I caulked it with thet as well as I could. It wasn't much better nor a sieve when I'd done, an' when I got afloat half ther time I was over ther ankles in water; but it served, an' I drove it as fast as I dared.'

'I didn't think the canoe could have been repaired under a couple of days' time.'

'It couldn't—not to last. But what I did to it served the purpose an' helped me to follow quick. I reckon thet first shot of mine gave them rascals ther jim-jams.'

'Something like it,' answered Carwyke, with a laugh.

'Yep! I'd meant to get one o' them, but I didn't till ther next camp. I had an idea of followin' an' pickin' ther beggars off, one by one, as I should hev done if Standifer hadn't knocked me out. I lost time there, an' I was in a sweat thinkin' I'd lost yo' when I saw ther church, an' landed an' took to ther woods to spy out ther land. I saw Mardock come out of ther house, an' I guessed then thet yo' an' Miss Norma weren't far off. I guess I must hev fallen asleep in ther bush where I was hidden, for ther next thing I saw was Mardock walkin' like a very sick man, leanin' on a rifle an' carryin' an axe. I saw him tryin' to knock off ther lock of ther door of ther cabin where yo' were, an' where before I'd seen a buck sittin' with a gun, an' I guessed there was somethin' there thet he wanted pretty badly; an' when I asked him where you and Miss Norma was, he told me—though he was wrong about Missy, or I didn't get him right. 'Twas I thet knocked off ther padlock an' let yo' loose, him being too far gone with drink or dope to do much.'

'He did his best. He sent us to Norma.'

'Yep! I guess he did ther right thing at last. Must hev got across with Standifer.'

'Perhaps he had interfered to save Norma, or why did Standifer dope him, if doped he was?'

'Ain't got a doubt about thet. I've had ther knockout drop in my time myself; same as many a poor sailor-man who's been crimped from the waterside saloons at 'Frisco—an' I know. . . . Thet devil Arloff was a surprise to me, though. Maybe I oughtn't to hev plugged him——'

'He deserved it!' said Carwyke feelingly.

'I knew thet, but I was thinkin' of Missy too. He might hev married her to thet scoundrel if I hadn't shot him when I did.'

'That is very likely.'

'So I reckon I did ther very best thing!'

'Yes! We might not have been here now if you had not fired, and Norma might have been Standifer's wife.'

'Widow, yo' mean.'

'No, I mean——'

'I'd hev shot Standifer, as I would a wolf, before he should hev taken Miss Norma off.'

The man lapsed into silence, and after a little time, looking at him closely, Carwyke saw that he was sleeping. He paddled steadily on, watching the right bank for any sign of Standifer and Bull, and keeping an eye on the river ahead on the alert for rapids. The land was unutterably silent. The woods on each hand seemed to be without life, though now and again a wedge of geese passed overhead, and round a craggy hill in front a pair of eagles wheeled. The river, as he noted, was broadening a little. Ahead a spruce-covered island lifted itself like a battleship, and on the right there was a murkiness in the sky which told of unseen forest fires. They were moving through a land of hills, and on the high ridges there was the gleam of snow. The mystery of the wild brooded over the silent landscape. The still woods, sunlit on their tops and with occasional gleams in their deep shadows, might have been part of some picture through which this river ran, and induced such a sense of unreality that more than once he felt that he was dreaming, and that the things he saw had no external reality.

The events through which Carwyke had so recently passed began to seem very far away, and no part of the present at all. The river winding through the hills was a symbol of life, as it appeared to him in those hours. For a few minutes its separate reaches opened out before him, the enclosing spruce in parallel lines on either hand, and when the reach was covered a bend in the water's course opened a new vista, and, on looking back, the way he had come was hidden. 'After all,' he whispered to himself, 'it is what lies ahead that matters.'

His mind, losing the somnolence set on it by the silent wilderness, quickened to the thought of the future. Whither this river led he had no idea; and what the future held was hidden. But from time to time his eyes rested on the sleeping girl, who in the last two months had

passed through so many harsh experiences and perils. The mystery that surrounded her was still unexplained. Standifer's determination to make her his wife in spite of her active dislike, and the excitement of Nicholovitch on learning her name, had their spring in something other than the sheer attraction of her beauty, and what that might be he could only guess. And a guess was—just that and no more.

As he thought, he visioned her walking across the tundra, expectant, lingering for his coming, and heard Eskimo Billy's words, 'There's Missy lookin' back for yo'.' Had he been wise not to follow? Was it not quixotic folly to let a scruple decide the future? There were practical considerations to be faced. When they reached civilisation—if they ever did—what was he to do with her? Knowing nothing of the great world, ignorant of the perils of the predatory cities, he could not set her adrift in the care of a man who had spent most of his life in the fo'c'sles of whaling-ships, and who, however devoted to her interests, would in certain situations be incapable of defending her. Her friends? He thought of the teeming millions of the States, and realised the difficulty he would have in finding any one on whose relationship she would have a claim; then again his eyes sought the girl, sleeping now like a child, with the sunlight gleaming on her golden plaits.

Quite suddenly he made up his mind. He would set aside the scruple which had its genesis in the mystery which surrounded her, and which might never be solved. He would follow the dictates of his heart, and if the girl gave him her love, become her rightful protector, as Billy had urged he should.

That decision made his fears for Norma's future fade, and he began to weave rosy plans for the years immediately ahead. He had lived a gipsy life, roving at will, seeking the gold at the rainbow's foot, and marriage usually meant an end of such wanderings; but it would not be so in his case. Norma was a fit mate for a man who loved the wilds. Cities were unknown to her, and after the excitement of her first experience she would tire, and pine for the solitudes, for the bleak shores of the misty seas and the wide desolation of the tundra. She was a child of Nature, and he would teach her to love the things he loved—the scarped hills, the great woods, the rushing rivers. He glanced down at her where she lay sleeping. The loose neck of her Eskimo garment had slipped back, revealing the whiteness of her skin below the ring of tan, and with his brown eyes alight with dreams, he began to hum the song he had hummed before far back on the tundra:

'Here shall I build my cedar house,
A city with gates, a road to the sea—
For I am Lord of the Earth!
Hew! Hew!'

Some day he and Norma would build a home in the wilds, together. His ears heard the ring of the axe, and the crash of the felled trees; his eyes visioned the rising walls of the log-house. He heard the thresh of the snow outside whilst they lay warm within, and his hopes whispered that some day, in that home in the wilds, a child would be born to them, a strong son of the wilderness—

A groan from Billy broke in on his dreams, causing him to return swiftly to the stark realities of the present. The wounded man still slept; but he moved uneasily, as one tormented by the unreal life of dreams or by the realities of pain. He stared at the man closely. His face was flushed, and there were twitchings that spoke of racked nerves. If Billy were to fall ill, or the wounds from which he was suffering were to take the wrong course, to continue the journey would be almost impossible. He would have to pitch a camp, and with Norma's aid nurse the man back to health; and with the short summer past its zenith, that contingency held possibilities that he scarcely dared to consider.

A winter in the wilds, in the circumstances in which they were placed, would be a hazardous undertaking. The Indians had been generous with stores—generous to the limit of the canoe's capacity—and this looked like a good game-country; but, for all that, contemplation did not make for peace. And if they were delayed, there were other possibilities that might operate. Standifer and Bull were both at large. They might or might not be in a position to follow and resume hostilities, separately or together, and Standifer was a determined and ruthless man. Once on their trail, he would follow it to the end. And if Billy were helpless, a shot from behind a tree would put himself out of action for ever, leaving Norma utterly at the scoundrel's mercy.

At the thought he turned slightly and considered the backward reach of the river. So far as it was visible it was empty and silent; but for all that he ceased to content himself with steering only, and drove the paddle hard to get an increased way on the canoe.

(Continued on page 392.)

QUENCHING A CITY'S THIRST.

THROUGHOUT recent months the silence of the Westmorland valleys has been broken by the scrape of the spade and the blow of the pick. Should the traveller pause to inquire the meaning of this unusual activity, he will be told that it is the pipe-track workings.

A small army of men is busily engaged laying another of the large iron arteries which supply Manchester with the most indispensable of all life's necessities, drawn from the natural resources of the English Lake Country.

The continued tendency of the population of Great Britain to congregate in large cities for the purposes of trade and employment has thrown a heavy responsibility upon local authorities, whose duty it is to provide a water-supply at once adequate and pure. It must be realised that if manufacturing and municipal requirements are added to those which are merely domestic, an allowance of some thirty gallons per day must be made for each inhabitant of a modern city; and, even in a well-planned system, there is always a good deal of waste before the water can reach the consumer. The sinking of deep wells is expensive and often unsatisfactory, and it may be stated without fear of contradiction that no river of any size in England yields water sufficiently free from pollution to be fit to drink without previous treatment.

Thus it is that many large communities have found it economical to derive their water-supplies from sources which are remote, but otherwise satisfactory. It is a good many years now since

the Manchester Corporation acquired Thirlmere, and any opposition which there may have been to taking over the lake for so prosaic a purpose as a water-supply has died long ago for want of justification. Those who have had the good fortune to visit the English Lake District will recollect that Thirlmere lies beside the road from Keswick to Grasmere, just before Wythburn is reached, with its old inn and quaint chapel. Beyond this point the descent of the pass called Dunmail Raise begins, carrying the wayfarer swiftly down from the barren highlands to the comfortable and wooded vales about Windermere. Thirlmere lies, then, in the high country to the north of the pass, a large, narrow, rather bleak stretch of water close under the rugged shoulders of Helvellyn, and having on its western shores a great barrier of fells and mountains rising higher and higher, like giant steps, to culminate in Scafell Pikes.

A stranger would scarcely guess that this is the reservoir of a great industrial centre ever so many miles away. It is true that the lake has been somewhat altered, deepened and extended, with a good road made about it; but the small, gray, stone building where the flow is controlled is inconspicuous and half-hidden among pine-trees. There is nothing about Thirlmere to suggest the hustle and bustle of far-away Cottonopolis, with its clogs and shawls, prosperity and poverty, gaiety and gloom, except perhaps the red-painted gates and posts and notices—guides only to the initiated of the line of the pipe-track.

Wherever the pipe-track passes, from its Cumberland home, through Westmorland hills and dales, and on into Lancashire to fulfil its great purpose, the line is marked by red fences and red gates and red Corporation notices, with occasional stone buildings where regulating-chambers are required.

The work in progress at present is concerned with the fifth pipe. Ultimately another lake will be linked up with the supply.

Hawes Water, on account of its comparative inaccessibility, is little visited by the ordinary tourist. It is situated among the hills to the north-west of Shap Fells, and drains a host of dales more famous for their excessive rainfall than for anything else. One of them, indeed, bears the name of Wet Sleddale.

What kind of water comes from these lakes? It is obvious that such waters can suffer but little contamination, and what little finds its way into them is destroyed by two great natural agents of purification—dilution and storage.

Bacteriologists are in the habit of judging the standard of purity of a water by the number of germs of intestinal origin which can be demonstrated in it, these germs being natural inhabitants of the intestines of men and animals, and falling under the group name *colon bacilli*. Closely related are disease-producing organisms, such as the bacilli of typhoid and dysentery.

Now it has been shown that not only is any danger from these diminished by dilution, but that when good water is stored in a lake, any of these intestinal organisms which happen to be present tend to disappear, or become changed into forms which are difficult to recognise, and which have lost their capacity for doing harm. Chemical analysis, too, can detect impurities in water, and trace their source with considerable accuracy. These 'Upland Surface Waters,' as they are called, are commonly of great chemical and bacteriological purity—that is, so far as disease-producing agents are concerned—and hence furnish a most desirable supply.

Manchester is not the only great city which has had the courage to seek its supplies at a distance. Liverpool and Birmingham derive their water from Wales, and Bristol from Blagdon Lake in Somerset. Blagdon Lake is well stocked with brown and rainbow trout, and affords capital sport for the angler. Some years ago six and eight pounders were fairly common events, but the size of the fish seems to have fallen off lately.

The Yorkshire towns have, for the most part, good moorland supplies near at hand. Edinburgh is fortunate in having a supply of excellent water in the neighbouring Pentland Hills, but this had to be supplemented by a reservoir damming the Talla Water, in the upper Tweed valley, some forty miles to the south. Glasgow, also, had to look far afield, and obtains water of extreme purity from Loch Katrine. So pure is this water that it was

feared that it might act upon and dissolve the lead of the house-pipes, a peculiar property of very pure, well-aerated water. In practice this has not been found to occur, at all events to the extent of causing symptoms of lead poisoning. Moreover, it is interesting and comforting to learn that the presence of very small quantities of lime and silica check this undesirable solvent action.

The art of conveying water long distances in aqueducts was practised by the ancients, and was brought to a high state of perfection by the Romans, the remains of whose work may still be seen in France and elsewhere. More modern aqueducts, or 'leats,' as they are termed locally, may be seen in Devonshire. Not long ago the water from Burrator, an artificial lake on the southern slopes of Dartmoor, made by damming the head-waters of the river Meavy, was conveyed to Plymouth in this way. But the supply is now piped, thereby avoiding much leakage and possible contamination.

It is rather surprising that London, the largest city of all, should have a supply which requires careful supervision and treatment before it is passed to the consumer. The bulk of London's water comes from the Thames, the New River, and the river Lea. Such water cannot be regarded as fit for domestic use in the crude state, and its purification is brought about in two ways. Firstly, it is stored or 'impounded' for a period, to let the suspended matters settle and to allow disease-producing organisms to disappear in the manner referred to. Secondly, the water is filtered through a thick layer of sand superimposed upon gravel and coarse stones. Among these last open the mouths of the delivery pipes for filtered water.

It may sound paradoxical, but the effective filtration of the water depends upon the presence therein of lowly animal and vegetable organisms, mostly harmless, and upon their being deposited and growing on the surface of the sand. Not until the sand is covered with a greenish gelatinous layer of living matter does the filter work at its best; and it is only when this growth becomes too thick, and filtration consequently too slow, that cleansing is necessary or desirable. On an average an acre of filter bed is capable of dealing with rather more than a million gallons of water a day. The principal installation for the purification of London water is at Hampton.

Britons are sometimes prone to compare their country with others to its disadvantage, but they have at least the satisfaction of being able to turn on the tap in most towns and cities as and when they please, and without serious regard to the quantity or quality of the contents. Experience of countries where water is unusable or too precious to use makes one appreciate all the more the blessings of a good and sufficient supply.

G. B. P.

'BLAIRO.'

THE STORY OF A STRANGE FRIENDSHIP IN THE WILD.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

PAT MUDD, who rejoiced in the very appropriate occupation of mole catching, caught the young badger in a running noose, cunningly placed on a runway for the reception of one of the family. He was quite a little fellow, and had no thought of biting, so that Pat might just as easily have carried him home under one arm. But, being an Irishman, Pat chose to tie a string to one of Little Brock's hind-legs, and with a leafy sprig in the other hand he proceeded to drive his captive home—down the white highway and so through the village street. No pig would have been so docile, for the little badger jogged quietly ahead, only once or twice making a half-hearted dash for freedom, and so the village was reached, where the strange scene created no little surprise and merriment. Time and again Pat stopped to talk to an interested wayfarer, whereupon the little badger, tired out, would sit down till a tap from the leafy wand indicated that it was time to move on; and when once a dog dashed out at him snarling, Brock just rolled himself in a ball, his nose between his fore-paws, remaining thus till the dog was sent about its business.

Pat was anxious to sell the badger, and to convert the proceeds into liquid refreshment, but it was not with the highest hopes that he turned his steps—naturally, I suppose—towards the Castle. Even lairds do not buy things simply for the sake of getting rid of their superfluous cash, and Pat could think of no special reason why the laird should want to own a badger. He was in luck's way, however, for at the approach to the house he met the laird's children, and the rotund little captive, jogging so obediently ahead of its captor, won their hearts. Little Brock was placed in a doll's perambulator, where, gladly enough, he burrowed down among the rugs and pillows.

'What about—er—vermin?' inquired the lady accompanying the children.

'Never bother your head, ma'm,' Pat advised. 'There was once a sportsman offered a hundred pounds for a genuine badger flea, and no one could supply one. A hundred pounds, mind ye!'

This was true, for of all wild beasts the badger, in spite of libellous tradition, is unquestionably the cleanest.

II.

So Brock became the pet of the Castle children, but from the hour of his arrival he knew no
